Newtownards, *spt., mkt. industl. t., mun. bor.,* Down, N. Ireland; 7 m. E. of Belfast; hosiery; p. (1961) *13,090.*

Neyland, *t., urb. dist.,* Pembroke, Wales; on Milford Haven; rly. terminus; p. (1961) *2,149.*

Nezhin, *t.,* Ukrainian S.S.R.; rly. junction on Kiev–Moscow line; p. (1954) *50,000.*

Ngami, *L.,* Botswana, S. W. Africa; swamp, the remnant of a much larger L.

Ngauruhoe, *mtn.,* N.I., N.Z.; an active volcano; alt. 7,515 ft.

Niagara, *R.,* forming part of boundary between Canada and U.S.A.; flows from L. Erie to L. Ontario; has rapids and the famous falls (167 ft.); gr. hydro-elec. power-sta.; length 35 m.

Niagara Falls, *t.,* Ontario, Canada; opp. the falls; carborundum, canning, silverware, castings; p. (1961) *22,351.*

Niagara Falls, *c.,* N.Y., U.S.A.; extending along the summit of cliff for 3 miles; paper, flour, aluminium; p. (1960) *102,394.*

Niamey, *t.,* Niger rep., W. Africa; one of the termini (the other is Zinder) of the trans-Sahara motor routes; p. (estd. 1963) *42,000.*

Nias, *I.,* W. of Sumatra, Indonesia; 95 m. long.

Niassa, *prov.,* Mozambique, Port. E. Africa; ch. t. Nampula; p. (1962) *276,795.*

Nicaragua, *rep.,* Central America; tropical forest; heavy rain in summer; uniformly hot; coffee, cocoa, sugar, bananas; gold and silver; cap. Managua; a. 57 145 sq. m.; p. (estd. 1965) *1,597,000.*

Nicastro, *mftg. t.,* Calabria, Italy; W. of the Apennines; olives, wine; p. *24,869.*

Nice, *c., spt., cap.,* Alpes Maritimes, France; on Mediterranean cst., at the foot of the Alps; beautiful climate and surroundings; joins ancient t. of Cimiez; ceded to France in 1860 by Sardinia; winter health resort; fruit and flower exp., perfume mftg.; p. (1962) *294,976.*

Nicobar Is., *see* Andaman and Nicobar Is.

Nicosia, *c., cap.,* Cyprus; the ancient Ledra; fortified, mosques; hand weaving; cap. of admin. dist. same name; p. (1965) *103,000.*

Nicoya, G. of, *inlet,* Costa Rica.

Nictheroy, *see* Niteroi.

Nidd, *R.,* trib. of R. Ouse, W.R. Yorks, Eng.

Nidwalden, *can.,* Switzerland; a. 106 sq. m.; p. (1961) *22,188.*

Niederhermsdorf, *t.,* S.W. Poland; formerly Germany; coal, explosives; p. *11,706.*

Niederwald, *hill,* opposite Bingen-on-the-Rhine, Germany; national monument commemorating German triumph over France 1870–71, and formation of the G. Empire.

Niemen or **Memel,** *R.,* Poland and U.S.S.R.; flowing to the Kurisches Haff; length 500 m.

Nienburg, *t.,* Lower Saxony, Germany; on R. Weser; glass, metal, wood, chemicals; p. (1963) *23,300.*

Nieuwveld Range, *mtns.,* C. of Gd. Hope, Union of S. Africa; part of S. terminal escarpment of African tableland; overlooks Gr. Karroo to its S.; forms impenetrable barrier to routes; mainly over 5,000 ft., max. alt. 6,276 ft.

Nièvre, *central dep.,* France; traversed by Morvan Mtns.; forests, livestock, coal, iron, steel; cap. Nevers; a. 2,659 sq. m.; p. (1962) *245,921.*

Nigde, *t.,* Turkey; p. (1960) *18,010.*

Nigel, *t.,* Transvaal, S. Africa; gold mng.; industl.; p. (1960) *33,896* inc. *7,880* whites.

Niger, *gr. R.,* W. Africa; rises nr. sea in outer mtn. zone of W. Africa, as R. Tembi, and sweeps round by Timbuktu to a delta in the G. of Guinea, on a circuitous course of 2,600 m., receiving its gr. trib. the R. Benue, about 250 m. from the mouth; navigable for 1,000 m.

Niger, *indep. sovereign st.,* W. Africa; millet, groundnuts, rice; sheep, goats; cap. Niamey; a. 494,000 sq. m.; p. (1961) *2,870,000.*

Niger Dam, Nigeria; at Kainji I.; dam projected 1964.

Nigeria, Republic of, *indep. sovereign st.,* within Br. Commonwealth (Oct. 1, 1960), West Africa; occupying lower basin of R. Niger, with region adj. up to Lake Chad; exp. world's lgst. supply of palm kernels and palm oil; groundnuts, cocoa, rubber, cotton, bananas; tin, asbestos, coalmng.; natural gas pipeline from fields at Owaza to Aba, E. Nigeria; oil in the Niger delta a.; cap. Lagos, lgst. c. Ibadan; fed. divided into 12 sts. in lieu of regions May 1967; total a. 356,669 sq. m.; p. (1963) *55,600,000.*

Nightingale, *I.,* most S. of Tristan da Cunha gr., S. Atlantic.

Niigata, *c., port,* Honshu, Japan; coal, petroleum; gas pipeline to Tokio under constr.; p. (1964) *345,000.*

Niihama, *c.,* N. Shikoku, Japan; on cst. of Inland Sea 20 m. S.E. of Imabari; refines copper obtained from Besshi Mines 12 m. to the S.; petrochemicals; p. (1947) *42,392.*

Niitakayama, *mtn.,* Taiwan I., China; highest mtn. of Niitaka Chain; alt. 12,939 ft.

Nijar, *t.,* Almeria, Spain; fruit, nuts, grain; textiles, porcelain; lead, manganese, iron ore; p. *10,107.*

Nijmegen, *c.,* E. Neth.; on R. Waal, nr. Arnhem; univ.; mnfs. ale, Prussian blue, cigars, pottery, metal-work; p. (1967) *144,004.*

Nijni-Novgorod, *see* Gorki.

Nikaria, *I.,* Dodecanese Archipelago, Greece.

Nikko, *t.,* Honshu, Japan; famous temples and shrines; beautiful tourist resort; p. *8,000.*

Nikolayev, *fortfd. t.,* Ukrainian S.S.R.; nr. Kherson, at head of estuary R. Bug; 2nd lgst. shipbldg. ctr. in U.S.S.R.; engin., petroleum refining; p. (1962) *258,000.*

Nikolayevsk, *t., pt.,* R.S.F.S.R.; on R. Amur; iron ore, engin., oil refining; p. (1954) *50,000.*

Nikopol, *t.,* Ukrainian S.S.R.; on R. Dnieper; manganese prod.; engin., steel; p. (1959) *81,000.*

Nikšic, *t.,* Montenegro, Jugoslavia; N. of Cetinje; p. (1960) *16,000.*

Nile, *the longest R.* in the world (*see* **White Nile** (Bahr-el-Abiad) and **Blue Nile** (Bahr-el-Azrek)); flows through a longer stretch of basin (over 2,450 m. in a direct line) than any other R. in the world, and along all its windings measures 4,145 m.; on Upper Nile navigation is hindered by sudd (floating vegetation); R. rises April, overflows Sept.; formerly cultivation entirely dependent on annual floods, but now assisted by dams, at Asyût, Aswan, Sennar, for regulating flow and navigation; first stage of Aswan High Dam completed 1964 when Nile waters were diverted.

Niles, *t.,* Ohio, U.S.A.; p. (1960) *19,545.*

Nilgiri Hills, Madras, S. India.

Nîmes, *t.,* Gard, France; Roman antiquities, educational institutions; silk, cottons, carpets, machin., wine tr.; p. (1954) *89,130.*

Nineveh, *celebrated ancient c.,* Iraq, stood on E. bank of upper R. Tigris, opp. modern Mosul.

Ningpo (Ningbo), *c., spt.,* Chekiang, China; 100 m. from Shanghai; leading fishing pt., comm. and mnf. ctr. p. (1958) *238,000.*

Ningsia, *aut. reg.,* N.W. China; bounded on N. by Inner Mongolia; cap. Yinchwan; p. (estd. 1957) *1,810,000.*

Ninh Binh, *t.,* N. Viet-Nam; p. *25,000.*

Ninove, *t.,* Belgium; on R. Dender; industl.; p. (1962) *11,898.*

Niobrara, *R.,* U.S.A.; trib. of Missouri R.; flows from Wyoming to Nebraska; length 450 m.

Niort, *t.*, Deux-Sèvres, France; noted for its mkt. gardens, and leather mnf. (gloves); p. (1954) *33,167*.

Nipigon, *L.*, in Thunder Bay dist., Ontario, Canada; 70 m. long, 50 m. wide, 1,000 Is.; discharges by N. R. to Lake Superior; 80 m.

Nipissing, *L.*, Ontario, Canada; 50 m. long, 35 m. wide.

Niriz, *t.*, Fars prov., S.W. Iran; on old caravan route from Kerman to Shiraz; p. *9,000*.

Niš, *t.*, Jugoslavia; on R. Nishava; p. (1960) *75,000*.

Nišava, *R.*, Jugoslavia; rises in Stara Planina, flows N.W. into R. Morava nr. Nis; valley used by trunk rly. from Belgrade to Sofia and Istanbul (Constantinople); length over 100 m.

Niscemi, *commune*, Caltanissetta prov., Sicily; sulphur, agr.; p. *20,281*.

Nishapur, *mkt. t.*, N.E. Iran; Khurasan,; in fertile a.; cotton, fruits; famous turquoise mines nearby; birthplace of Omar Khayyám; impt. archaeological finds dating 9th and 10th cent.; p. *c. 30,000*.

Nishinomiya, *c.*, S. Honshu, Japan; brewing, vegetable oils; p. (1964) *317,000*.

Niterói, *t.*, *cap.*, Rio de Janeiro st., Brazil; soap, textiles; p. (1960) *245,467*.

Nith, *R.*, S.W. Scot.; flows to Solway Firth, S. of Dumfries; followed by main rly. from Carlisle to Kilmarnock and Glasgow; length 71 m.

Nitra (Neutra), *R.*, ČSSR.; trib. of R. Waag; length 100 m.

Nitra, *t.*, ČSSR.; on R. Nitra; p. (1961) *34,242*.

Niue or Savage I., Pac. Oc.; one of Cook Is., but under separate admin.; belongs to New Zealand; ch. pt. Alofi; copra, plaited basketware, sweet potatoes; a. 100 sq. m.; p. (1959) *4,781*.

Nivelles, *t.*, Brabant, Belgium; rly. wkshps., paper; p. (1962) *14,483*.

Nivernais, *old prov.*, France, now forming Nièvre prov. and part of Cher.

Nizampatam *t.*, *spt.*, Madras, India; formerly called Pettipollee after the neighbouring village of Pedapalle; first trg. estab. made by the Brit. in the Madras presidency in 1611.

Nizhneudinsk, *t.*, W. Irkutsk, R.S.F.S.R.; new mftg. t.; p. *10,342*.

Nizhniy Tagil, *t.*, R.S.F.S.R.; in Ural mtns.; iron ore, iron and steel, railway cars, engin., chemicals; p. (1962) *359,000*.

Njole, *t.*, Congo Rep., Equatorial Africa; on R. Ogowe

No, *L.*, Bahr-el-Ghazal prov., Sudan, N.E. Africa; vast swamp a. 350 m. S.W. of Khartoum receiving Rs. Bahr-el-Jebel and Bahr-el-Ghazal (to form White Nile); flow of water blocked by papyrus reed and floating weed (sudd); gr. loss of water by evaporation.

Noakhali, *dist.*, and *t.*, Chittagong div., Pakistan; p. (of t.) *13,063*.

Nobi Plain, S. Honshu, Japan; located at head of Ise Bay; composed of: (1) low, badly drained alluvial plain on W. under intensive rice cultivation, (2) higher, drier, terraces on E. under mulberry, vegetables, pine-woods; very dense urban and rural p.; ch. textiles and pottery mftg. a. in Japan; inc. cities Nagoya, Gifu, Yokkaichi; a. 720 sq. m.

Noblesville, *t.*, Ind., U.S.A.; agr., horse breeding; p. (1960) *7,664*.

Nocera Inferiore, *t.*, Italy; nr. Naples; the ancient Nuceria Alfaterna; p. (1961) *43,050*.

Nogent-sur-Marne, *t*, Seine, France; S.E. sub. Paris; chemicals, knives; p. (1954) *23,581*.

Noginsk, *t.*, R.S.F.S.R.; nr. Moscow; textiles, metals; natural gas pipeline from Central Asia projected; p. (1959) *93,000*.

Noisy-le-Sec, *t.*, Seine, France; p. (1954) *22,337*.

Nola, *t.*, Italy; at foot of Vesuvius, 12 m. N.E. of Naples; was an ancient c. of Campania, noted for its vases; p. *20,253*.

Nome, *cst. t.*, Alaska, U.S.A.; gold; (1960) *2,316*

Noordoostpolder, Overijssel, Neth.; land reclaimed from Zuider Zee, 1942; a. 185 sq. m.; p. (1967) *31,016*.

Noordwijk, *resort*, W. cst., Neth.; p. (1967) *20,563*.

Noranda, *t.*, Quebec, Canada; 12 m N.E. of Rouyn; goldmines; p. (1961) *11,477*.

Norcia, *t.*, Italy; old walls, cath.; famous for pork and terra-cotta.

Nord, *N. dep.*, France; on Belgian frontier and N. Sea; flourishing agr., mining, iron and coal, textile and chemical mnfs.; cap. Lille; a. 2,229 sq. m.; p. (1962) *2,293,112*.

Nordenham, *pt.*, Lower Saxony, Germany; on Lower Weser; cables, textiles, metals, shipbldg., fishing pt.; p. (1963) *27,100*.

Norderney, *I.*, Frisian Is., Germany; resort.

Nordhausen, *c.*, Erfurt, E. Germany; in Harz Mtns.; cath.; engin., agr. machin., clothing inds.; rly. junction; p. (1963) *41,401*.

Nordhorn, *t.*, Lower Saxony, Germany; nr. Neth. frontier; textiles; p. (1963) *40,200*.

Nordkapp or N. Cape, *most N. point*, Europe; on Magerö I., Norway.

Nordkyn, *most N. point*, with N. Cape, of the European mainland, Norway, opposite N. Cape.

Nordland, *co.*, Norway; a. 14,728 sq. m.; p. (1963) *240,314*.

Nordlingen, *t.*, Bavaria, Germany; carpet factories; p. *8,800*.

Nore, The, *sandbank, lightship*, Thames estuary, Eng.

Nore, *R.*, Ireland; trib. of R. Barrow; length 70 m.

Norfolk, *co.*, E. Eng.; noted for shallow lake expanses known as the Broads, popular yachting region; farming, corn, potatoes, cattle, fisheries (Yarmouth), brewing, boots, mustard, farm machin.; cap. Norwich; a. 2,055 sq. m.; p. (1961) *561,980*.

Norfolk, *c.*, Nebraska, U.S.A.; on Elkhorn R.; in farming country; p. (1960) *13,111*.

Norfolk, *c.*, Va., U.S.A.; impt. naval sta.; spt.; shipbldg. and repair, car assembly, food processing, lumber, fertilisers; p. (1960) *305,872*.

Norfolk I., *fertile Australian I.*, Pac. Oc.; 800 m. E. of N.S.W. partial autonomy 1957; formerly a penal settlement; discovered by Captain Cook, 10 Oct. 1774; bean seed, whaling; a. 13 sq. m.; p. (1959) *1,048*.

Noric Alps, *mountainous region*, Styria, S. Austria.

Norilsk, *t.*, E. Siberia, R.S.F.S.R.; most N. t. in Russia; coal mng. uranium, nickel, copper; natural gas pipeline from W. Siberia; p. (1959) *108,000*.

Normal, *t.*, Ill., U.S.A.; mkt. gardening, fruit, plants; univ.; p. (1960) *13,357*.

Norman, *t.*, Okla., U.S.A.; oil-field; cotton processing; agr.; univ. of Okla.; p. (1960) *33,412*.

Norman Wells, *t.*, N.W. Terr., Canada; at confluence of R. Mackenzie and G. Bear R., 70 m. W. of G. Bear L.; ctr. of rich oil-field.

Normandy, *old French prov.*, on Eng. Channel; mainly agr.; now divided into deps. Manche, Calvados, Eure, Seine-Maritime and part of Orne; Rouen was cap.; the Roman Lugdunensis; later a powerful Dukedom; conquered England, 1066.

Normanton, *t.*, *urb. dist.*, W.R. Yorks, Eng.; on R. Calder 2 m. E. of Wakefield; coal-mining, rly. wks.; p. (1961) *18,307*.

Norrbotten, *co.*, N. Sweden; a. 40,754 sq. m.; cap. Piteå; p. (1961) *261,672*.

Norris Dam, Tenn., U.S.A.; across R. Clinch at confluence with R. Tenn., N.W. of Knoxville; lgst. dam Tenn. Valley Authority (TVA); built for flood control and hydro-elec.

Norristown, *bor.*, Penna., U.S.A.; textiles, hosiery, carpets; p. (1960) *38,925*.

Norrköping, *pt.*, *t.*, Sweden; N.E. of Linköping; textiles, margarine, paper; agr. machin.; ocean-going shipping through Lindö Canal; p. (1960) *91,661*.

Norte de Santander, *dep.*, Colombia, S. America; a. 8,295 sq. m.; cap. Cucuta; p. (estd. 1959) *412,440*.

North Adams, *c.*, Mass., U.S.A.; on R. Hoosac; textiles, boots, and shoes; p. (1960) *19,905*.

North America, *northern continent*, of Western hemisphere, comprising Mexico, U.S.A., Canada, Greenland and excl. Central America and the W. Indies; cst. much indented; on W. high chain of mtns., lower range in E., and central plain. Climate varies considerably owing to wide range of latitude and altitude; great extremes of temperature; abundant rainfall on E. cst. and N. of W. cst.; S. of W. cst. Mediterranean; Mexico, sub-tropical and tropical. Vegetation diverse, varying with alt., latitude and climate; coniferous forests in N.; originally deciduous forests from E. cst. to approx. 100° W., then grassland to mtn. vegetation of W. range; semi-desert in S.W. Prairies once home of bison. Agr.: temperate and tropical prod., cereals, cotton, tobacco, sugar-beet, potatoes, etc.; lumbering; rich in minerals, coal, petroleum,

iron, manganese, etc. Gen. inds., comm., shipbldg. Formerly inhabited by Red Indians; now mainly occupied by White races, with many negroes in S.; p. (estd. 1965) *255,106,000.*

North Atlantic Drift, drift of surface waters of Atl. Oc. N.E. from Gulf Stream towards Europe; relatively warm; supplies prevailing S.W. winds with warmth and moisture to modify climate of Brit. Is. and countries on N.W. margin of European Continent. *See* Gulf Stream, Section L.

North Attleboro, *t.*, Mass., U.S.A.; jewellery mnfs.; p. (1960) *14,704.*

North Bay, *c.*, Ontario, Canada; p. (1961) *23,781.*

North Berwick, *burgh*, E. Lothian, Scot.; on S. of F. of Forth, 20 m. E .of Edinburgh; seaside resort; golf course; p. (1961) *4,161.*

North Brabant, *prov.*, Neth.; cap. 's-Hertogenbosch; a. 1,920 sq. m.; p. (estd. 1967) *1,700,866.*

North Braddock, *t.*, Penns., U.S.A.; p. (1960) *13,204.*

North Cape, *see* Nordkapp.

North Cape, *most northerly point*, N.I., N.Z.

North Carolina, *S. Atlantic st.*, U.S.A., E. of Tennessee and S. of Virginia; agr., maize, cotton-growing and mftg., tobacco culture and mftg., timber, scrap mica, textiles; cap. Raleigh; ch. pt., Wilmington; a. 52,712 sq. m.; p. (1960) *4,556,155.*

North Channel, Brit. Is.; gives access from Atl. Oc. to Irish Sea between S.W. Scotland (Galloway) and N.E. Ireland (Antrim); length 60 m.; narrowest width 15 m.

North Chicago, *t.* Ill., U.S.A.; chemicals, metallurgy, elec. goods; p. (1960) *20,517.*

North Crimean Canal, *canal*, U.S.S.R.; linking R. Dnieper with Black Sea and Sea of Azov, crossing steppes of S. Ukraine and the Crimea, terminating at Kerch; 1st section (77 m. long) opened Oct. 1963; when completed will be 220 m. long, 125 m. of which will be navigable.

North Dakota, *N.W. st.*, U.S.A.; mainly rolling prairie; agr., wheat, maize, oats, barley, flax, cattle, horses, sheep; coal, petroleum; cap. Bismarck; a. 70,665 sq. m.; p. (1960) *632,446.*

North Downs, range of low chalk hills across S. Eng., forming cliffs at Dover; alt. about 800 ft.

North Eastern New Guinea, part of New Guinea under Australian administration as Trusteeship terr. under United Nations; a. 69,700 sq. m.

North East Passage, along N. cst. Europe and Asia between Atlantic and Pacific. *See* Gen. Inf.

North Holland, *prov.*, Neth.; a. 1,051 sq. m.; cap. Haarlem; natural gas in Schermer Polder nr. Alkmaar; p. (1967) *2,200,602.*

North Island, *lge I.*, New Zealand; dairy prod.; lge. clay deposits at Matauri Bay; processing at Kaco; a. 44,281 sq. m.; p. (1964) *1,820,118.*

North Little Rock, *t.*, Ark., U.S.A.; p. (1960) *58,032.*

North Osetian, A.S.S.R., U.S.S.R.; a. 3,100 sq. m.; cereals, livestock, petroleum; p. (1959) *449,000.*

North Platte, *c.*, Nebraska, U.S.A., on N. Platte R.; in irrigated reg. of the Great Plains; grain, livestock, processed meat; p. (1960) *17,184.*

North Platte, *R.*, rises N. Colorado, flows 680 m. through Wyoming, across W. Nebraska to join S. Platte at c. of North Platte; extensive power and irrigation developments.

North Providence, *see* Nassau.

North Rhine–Westphalia, *Land*, Germany; a. 13,153 sq. m.; p. (1961) *15,902,000.*

North River, Kwangtung, S. China; rises in Nan Ling mtns., flows S. into Canton delta; length 300 m.

North Sea, arm of the Atlantic, E. of Gr. Brit., W. of Norway, Sweden and N. Germany, and N. of Holland, Belgium and France; length 600 m., width 400 m.; good fisheries.

North Sea Canal, *ship canal*, N. Holland, Neth.; connects Amsterdam to N. Sea at IJmuiden depth 46 ft., length 16 m.

North Shields, *mkt. t.*, Northumberland, Eng. Tyne pt. and part of the borough Tynemouth marine engines, chain cables, anchors, rope.

North Sydney, *spt.*, C. Breton I., Nova Scotia Canada; docks, coal; p. (1961) *8,657.*

North Tonawanda, *c.*, N.Y., U.S.A.; on Niagara R.; mnfs.; p. (1960) *34,757.*

North Walsham, *mkt. t.*, *urb. dist.*, Norfolk, Eng.; 13 m. N.E. of Norwich; p. (1961) *5,010.*

North-West Frontier Province, *former prov.* (dissolved 1955), now incl. in Peshawar div., W. Pakistan; mtnous, fertile valleys; bounded by Hindu Kush and Afghanistan on N., and on S. by Baluchistan and Punjab; ch. c., Peshawar; wheat, barley, sugar cane, tobacco, cotton; iron, copper, marble quarrying; irrigation wks.; a. 14,263 sq. m.; p. (estd. 1951) *3,239,000.*

North-West Passage, between Atl. and Pac. along Arctic cst. of Canada. *See* Section L.

North-West Staging Route, a daisy chain of airfields built during last war linking Edmonton, Alberta, with Whitehorse, Yukon.

North-West Territories, Canada; the N.W. region of Canada between the Yukon on the W., Hudson Bay on the E., and B.C., Alberta, Saskatchewan and Manitoba on the S.; divided into 3 dists., Franklin, Mackenzie and Keewatin; gold- and silver-mng., petroleum, furs, fisheries; a. 1,304,903 sq. m.; p. (1961) *22,998.*

North York. Moors, *limestone plateau*, N.R., Yorkshire; lies S. of estuary of R. Tees; drained N. to R. Tees, S. to R. Derwent and to N. Sea by R. Esk; heather moorland; some pastoral farming on lower slopes; impt. iron-ore quarrying along N. edge in Cleveland dist.; alt. varies from 1,000 to 1,500 ft.

Northallerton, *t.*, *urb. dist.*, N.R. Yorks, Eng.; in broad gap between Cleveland Hills and Pennines; dairy farming and agr. dist.; car and agr. engin., leather; p. (1961) *6,720.*

Northam, *t.*, W. Australia; on R. Avon, 66 m. from Perth, Australia; p. (1961) *7,192.*

Northampton, *S. Midland co.*, Eng.; chiefly agr.; iron, mining and mftg.; footwear, lace, leather, flax, light engin.; co. t., Northampton; a. 998 sq. m.; p. (1961) *398,132.*

Northampton, *t.*, *co. bor.*, Northampton, Eng.; on R. Nene; footwear mftg., leather goods, light engin.; p. (1961) *105,361.*

Northampton, *c.*, Mass., U.S.A.; textiles, paper; univ.; p. (1960) *30,058.*

Northampton, *t.*, Penns., U.S.A.; cement; beer; clothes; quarrying; p. (1960) *8,866.*

Northbridge, *industl. t.*, Mass., U.S.A.; p. (1950) *10,476.*

Northcote, *t.*, Victoria, Australia; N. sub. Melbourne; mnfs.; p. (1947) *42,713.*

Northern Ireland, consists of the administrative cos. of Antrim, Armagh, Down, Fermanagh, Londonderry and Tyrone, and administrative bors. of Belfast and Londonderry. Has its own parliament and executive Government under a Governor appointed by the Crown. Returns 12 members to British House of Commons; agr., oats, potatoes; textiles, chemicals, tobacco ind., electronic equip.; shipbldg; tourism; univs.; cap. Belfast; a. 5,238 sq m.; p. (1961) *1,425,462.*

Northern Rhodesia, *see* Zambia.

Northern Territories, Ghana, West Africa; lies N. of latitude 8° N.; ch. t. Tamale; incl. Togoland a. 41,063 sq. m.; p. (1948) *1,076,696.*

Northern Territory, a large tract of land N. of S. Australia; stock-raising, copper, gold, uranium, manganese, salt, bauxite; silver, mica, tin, tungsten; rice at Humpty Doo, 30 m. S. of Darwin; a. 523,620 sq. m.; ch. t. Darwin; p. (1964) *30,946.*

Northfield, *c.*, S. Minn., U.S.A.; agr., dairying; p. (1960) *8,707.*

Northfleet, *t.*, *urb. dist.*, Kent, Eng.; on S. bank of R. Thames, adjoining Gravesend; cement, paper, rubber, tyres, cables; p. (1961) *22,084.*

Northumberland, *N. maritime co.*, Eng.; on border of Scot.; pastoral, mining, coal and lead, mftg.; chemicals, glass, engin., and shipbldg. on Tyneside; cap. Newcastle-upon-Tyne; a. 2,019 sq. m.; p. (1961) *818,988.*

Northumberland Straits, separates Prince Edward I. from Nova Scotia and New Brunswick; 9 m. combined road and rail tunnel, bridge and causeway to link provs. projected.

Northwich, *mkt. t.*, *urb. dist.*, Cheshire, Eng.; on R. Weaver, 10 m. S.E. of Runcorn; chemicals, salt, engin.; p. (1961) *19,374.*

Norton, *t.*, S.W. Va., U.S.A.; coal, mftg.; p. (1950) *4,315.*

Norton, *t.*, *urb. dist.*, E.R. Yorks, Eng.; on R. Derwent opposite Malton; p. (1961) *4,773.*

Norton Sound, *inlet*, W. cst. Alaska, Behring Sea; 200 m. long.

Norwalk, *t.*, Conn., U.S.A.: on Long I. Sound; good harbour, oysters, iron foundries, clothing; p. (1960) *67,775*. [*88,739*.

Norwalk, *t.*, Cal., U.S.A.: oil refining; p. (1960)

Norwalk, *bor.*, Ohio, U.S.A.: mftg. ctr. of farming dist.; p. (1960) *12,900*.

Norway, *kingdom*, N. Europe: fjord cst., mtnous; climate influenced by prevailing winds, heavy rain and snowfall cstal regions: barley, forest prod., aluminium, pyrites; fisheries; hydro-elec. power; cap. Oslo; a. 124,556 sq. m.; p. (1963) *3,654,030*.

Norwich, *c.*, *co. bor.*, *co. t.*, Norfolk, Eng.; on R. Wensum just above confluence with R. Yare; univ.; cath., old cas., cult. ctr., agr. ctr.; boots, shoes, textiles, gen. inds.; p. (1961) *119,904*.

Norwich, *c.*, Conn., U.S.A.; firearms, cutlery and machin., textiles; p. (1960) *38,506*.

Norwood, S., *sub. div.*, Lambeth, Surrey, Eng.; mainly residtl. [(1960) *34,580*.

Norwood, Ohio, U.S.A.; *sub.*, Cincinnati; p.

Norwood, *t.*, Mass., U.S.A.: p. (1960) *24,898*.

Nossi Bé, *Is.*, Indian Ocean; off W. cst of. Malagasy; a. 130 sq. m.; rice, coffee, tobacco.

Notec (Netze), *R.*, Poland; trib. R. Warta; 140 m.

Noto, *c.*, Sicily; W. of Syracuse; cath.; wine, olive oil, mnfs.; p. *32,575*.

Notodden, *t.*, S. Norway; hydro-elec. power; iron smelting; nitrates; p. (1961) *7,383*.

Notre Dame Bay, N. cst., Newfoundland, Canada.

Nottingham, *midland co.*, Eng.; wheat, oats, barley, cattle, coal, oil; co. t. Nottingham; a. 844 sq. m.; p. (1961) *902,966*.

Nottingham, *c.*, *co. bor.*, *co. t.*, Nottingham, Eng.; on R. Trent, at S.E. end of Pennines; ctr. of English lace ind.; univ., R.C. cath., fine buildings, cas., museum, gr. mkt. square; hosiery, engin., pharmaceutical ind., chemicals, cycles; p. (1961) *311,645*.

Phan Rang, ctr. of irrigation scheme, S. Viet-Nam. [fish; p. *5,000*.
Phan Thiet, *spt.*, S. Viet-Nam; exp. dried and salt
Pharsala, *c.*, Thessaly, Greece; S. of Larissa; Cæsar's triumphs over Pompey.
Philadelphia, *c.*, *pt.*, Penns., U.S.A.; univ., R.C. cath., masonic temple; mint, academy of fine arts; shipbldg., locomotives, machin., surgical instruments, carpets, woollens, cottons, worsteds; sugar, and petroleum refining; ctr. of War of Independence, from 1790 to 1809; fed. cap. founded by Wm. Penn 1682; p. (1960) *2,002,512*.
Philae, *I.*, Upper U.A.R.; in Nile above Aswan Dam; temples dating from late Egyptian and classical times incl. famous temple to Isis; submerged by dam waters.
Philippeville, *t.*, *spt.*, Algeria; wine, sheep, cattle, cereals, cork, cigarettes, mineral water, macaroni, fish canning; p. (1954) *70,000*.
Philippeville, *t.*, Namur, S. Belgium; p. (1962) *1,554*.
Philippine Is., *rep.*, Asia; comprising over 7,000 Is., lgst. being Luzon, Mindanao, Mindoro and Palawan; mountainous, many volcanoes, highest Apo, 10,312 ft.; coal, iron, copper, gold; dye-woods, rice, maize, tobacco, coffee, cotton, Manila hemp; coconuts, cigars, pearl fisheries; cap. Quezon City; p. (1960) *27,087,685*.
Philippopolis, *see* Plovdiv.
Philipstown, *see* Daingean.
Phillipsburg, *c.*, N.J., U.S.A.; on Delaware R.; water-power, machin., rly. wks.; silk and pulp; p. (1960) *18,502*.
Phitsnulok, *t.*, central Thailand; temples; weaving; p. (1960) *30,364*.
Phlorina (Florina), *pref.*, Greece; occupied by Bulgaria, April 1941, restored to Greece by peace treaty of 1947; cap. Phlorina; p. (1961) *67,238*.
Phlorina (Florina), *t.*, Phlorina, Greece; in basin at alt. 3,000 ft., 10 m. from Jugoslav border, 15 m. from Albanian border, purely agr. interests; p. (1961) *11,933*.
Phnom-Penh, *t.*, *R. pt.*, cap. Cambodia, on Mekong R.; univ., airpt., rice, cotton; p. (1965) *404,000*.
Phoenix, *c.*, Arizona, U.S.A.; winter resort; iron, steel, aircraft, electronics, clothing; p. (1960) *439,170*.
Phoenix Group, *Is.*, Pac. Oc.; part of Gilbert and Ellice I. colony; a. 16 sq. m.; U.S. now have some rights over Canton and Enderbury; Canton used as international airport; p. (1956) *1,257*.
Phthiotis, *pref.*, Greece; cap. Lamia; p. (1961) *159,373*.
Phuket, *t.*, S. Thailand; tin smelting plant projected; p. (1960) *28,033*.
Piacenza, *prov.*, Emilia, Italy; a. 965 sq. m.; p. (1961) *282,813*
Piacenza, *t.*, Italy; cath., palaces, arsenal; motor cars, chemicals, cement; p. (1961) *87,930*.
Pianosa I., Italy; penal settlement; cereals, vineyards, olives; p. *1,000*.
Pias, *t.*, Alentejo Baixo, S. Portugal; E. of Beja.
Piatra-Neamt, *t.*, Moldavia, Romania; timber, pharmaceuticals, soap; p. (1963) *48,572*.
Piaui, *st.*, Brazil; cattle, cotton, sugar, tobacco, rubber; silver, iron and lead; a. 96,262 sq. m.; cap. Teresina; p. (1960) *123,368*.
Piave, *R.*, N.E. Italy; flows to Adriatic; length 125 m.
Piazza Armerina, Sicily, Italy; oil, wines and nuts; remarkable Roman mosaics (recently discovered); p. *28,420*.
Picardy, *old prov.*, France; which included all the Somme dep. and parts of Pas de Calais, Aisne and Oise; old battle sites, Agincourt and Crécy.
Pichincha, *prov.*, Ecuador; cap. Quito—the cap. of Ecuador; a. 6,218 sq. m.; p. (1950) *386,520*.
Pickering, *mkt. t.*, *urb. dist.*, N.R. Yorks, Eng.; on N. margin of Vale of Pickering, 6 m. N. of Malton; church with murals; iron, bricks; p. (1961) *4,193*.
Pickering, Vale of, E.R. Yorks, Eng.; wide, flat-floored vale, once occupied by glacial lake; bounded to N. by N. York Moors, to S. by York Wolds; drained W. by R. Derwent, which

leaves Vale through Kirkham gap; alluvial soils, marshy in ctr.; crop-farming along margins, grain, fodder crops; cattle grazing on damper meadows in ctr.; ch. ts. Pickering, Malton, Helmsley.

Pico da Bandeira, *mtn.*, Brazil; alt. 9,462 ft.

Picton, *t.*, S.I., N.Z.; freezing wks.; tourist and fishing ctr.; p. (1961) *2,320*.

Pidurutalagala, *mtn.*, Ceylon; alt. 8,295 ft.; highest peak in Ceylon.

Piedmont, *region*, N. Italy; rice, wheat, vines, fruits; silk, cottons, woollens; a. 9,818 sq. m.; p. (1961) *3,889,962*.

Piedras Negras, *frontier t.*, Mexico; cattle mkt., coal, silver, zinc and copper; p. *15,663*.

Pierre, *t.*, *cap.*, S.D., U.S.A.; on Missouri R.; p. (1960) *10,088*.

Pietermaritzburg, *t.*, *cap.*, Natal, S. Africa; 30 m. N.W. of Durban; named after Piet Retief and Gerhardus Maritz, two Boer leaders; lt. inds.; tanning; iron-ore mng. in a.; p. (1960) *95,124* inc. *39,472* Europeans.

Pietersburg, *t.*, Transvaal, S. Africa; gold, asbestos, tin; cereals, tobacco, cotton, oranges, lemons; p. (1962) *28,000* inc. *11,000* whites.

Piet Retief, *t.*, Transvaal, S. Africa; tobacco, fruit, mealies, wattle gr. in dist.; p. (1960) *8,604* inc. *2,745* whites.

Pikes Peak, *mtn.*, Col., U.S.A.; alt. 14,109 ft.

Pila (Schneidemühl), *t.*, N.W. Poland (since 1945); formerly in Prussian prov. of Pomerania; trade ctr., lignite mines nearby; p.(1965) *38,000*.

Pilar, *t.*, Paraguay; cotton, timber, hides, oranges; p. (estd. 1960) *10,000*.

Pilatus, *mtn.*, Switzerland; alt. 6,988 ft.

Pilawa (Pilau), *t.*, *spt.*, R.S.F.S.R.; shipbldg., fishing.

Pilbara, *dist.*, W. Australia; metal ores inc. gold, copper, tin; iron ore; ch. mining ctr., Marble Bar.

Pilbara, *new t.*, W. Australia; iron ore mng.

Pilcomayo, *R.*, rising in S. Bolivia, and flowing through the Gran Chaco, separates W. Paraguay from Argentina; trib. of the Paraguay; length 1,400 m.

Pilibhit, *t.*, Uttar Pradesh, India; rice, pepper, sugar; p. (1961) *57,527*.

Pilion, *celebrated mtn.*, S. of Mt. Ossa, Thessaly, Greece; alt. 5,310 ft.

Pilion Pass, Switzerland; alt. 5,092 ft.

Pimlico, *dist.*, Westminster, London, Eng.

Pinar del Rio, *prov.*, W. Cuba, W. Indies; tobacco, asphalt; a. 5,211 sq. m.; p. (1953) *448,422*.

Pinar del Rio, *t.*, Cuba, W. Indies; tobacco; p. (1953) *38,885*.

Pinawa, *t.*, Manitoba, Canada; 55 N.E. of Winnipeg; nuclear research; p. (1965) *8,000*.

Pind Dadan Khan, *t.*, W. Pakistan; coal; p. *11,445*.

Pindus, *mtn. chain*, between Thessaly and Albania, Greece; highest peak 8,050 ft.

Pine Bluff, *c.*, Ark., U.S.A.; cotton, motor-cars; p. (1960) *44,037*.

Pine Creek, *t.*, Arnhem Land, N. Terr., Australia; gold; p. *115*.

Pinerolo, *t.*, Italy; S.W. of Turin; cath.; silk, cotton, woollens; p. *22,890*.

Pines, Is. of, *dependency* of Fr. col. New Caledonia; a. 58 sq. m.; convict settlement.

Pinetown, *t.*, Natal; residtl., industl.; p. (1960) *12,799* inc. *6,965* Europeans.

Pinios R., Greece; flows into G. of Thessaloniki.

Pinjarra, *t.*, W. Australia; rly. junction; timber and stock-raising dist.

Pinneberg, *t.*, Schleswig-Holstein, Germany; N.W. of Hamburg; rose cultivation, metals, leather; p. (1963) *29,900* [a. 1,180 sq. m.

Pinos I. (I. of Pines), Caribbean Sea; S. of Cuba;

Pinsk, *t.*, Byelorussia, U.S.S.R.; paper, woodworking inds.; p. (1956) *36,500*.

Piombino, *t.*, Italy; port for Elba I.; steel wks.; p. *26,238*.

Piotrkow Trybunalski, *industrl. t.*, Poland; S. of Lodz; p. (1965) *57,000*.

Pique, *t.*, Ohio, U.S.A.; N. of Dayton; ironwks., woollens; nuclear reactor; p. (1960) *19,219*.

Piraeus, *see* **Peiraieus**. [olives; p. *14,875*.

Piran, *spt.*, Istria, Jugoslavia; salt, wines,

Piracicaba, *t.*, São Paulo, Brazil; sugar, cattle, coffee, oranges; p. (1960) *80,670*.

Pirmasens, *t.*, Rhineland–Palatinate, Germany; S.W. of Mannheim; footwear, leather goods; p. (1963) *53,100*.

Pirna, *t.*, Dresden, E. Germany; on R. Elbe; textiles, paper, glass; p. (1969) *41,076*.

Pirot, *t.*, Jugoslavia; nr. Bulgarian border; Jugoslavia; p. *13,033*. [*365,882*.

Pisa, *prov.*, Italy; a. 1,180 sq. m.; p. (1961)

Pisa, *c.*, Italy; at head of Arno delta, 12 m. N.E. of Leghorn; famous leaning tower, cath., univ.; mineral baths, cotton, silk; p. (1961) *91,108*.

Pisco, *spt.*, Peru, S. America; cotton; lead, zinc; whaling; p. (1961) *17,000*.

Pisco, *dep.*, Peru, S. America; p. (1961) *123,917*.

Pisek, *t.*, ČSSR.; brewing, iron foundries, textiles; p. (1961) *19,542*.

Pistoia, *t.*, Tuscany, Italy; on Arno plain, N.W. of Florence; iron and steel goods, silk, macaroni; p. (1961) *82,401*.

Pitcairn I., E. Pacific; British col.; incs. Henderson, Ducie, and Oeno Is.; sweet potatoes, bananas, oranges, coconuts; a. 2 sq. m.; p. (1965) *186*, mostly descendants of the mutineers of the *Bounty*.

Pitch Lake, Trinidad I., W.I.; located in the S. of the I., 10 m. S.W. of San Fernando; natural deposit of asphalt; tourism; a. 212 acres.

Pitea, *spt.*, N. Sweden; on G. of Bothnia; saw mills; p. (1961) *7,426*.

Pitesti, *t.*, Romania; on Arges R.; petroleum, fruit, grain; lge. automobile plant; p. (1963) *67,236*.

Pitlochry, *burgh*, Perth, Scot.; on R. Tummel, 4 m. S. of Pass of Killiecrankie; summer resort; distilleries, hydros; p. (1961) *2,051*.

Pittenweem, *burgh*, Fife, Scot.; at entrance to Firth of Forth; fisheries; p. (1961) *1,576*.

Pittsburgh, *c.*, Penns., U.S.A.; univ.; R.C. cath., coll., Carnegie Library and Institute; port on Ohio R.; ctr. of richest American coalfield; natural gas, petroleum, iron and steel, machin., metal goods, meat packing, glass, aluminium, chemicals; p. (1960) *604,332*.

Pittsfield, *c.*, Mass., U.S.A.; textiles, paper, plastics, elec. machin., hol. resort; p. (1960), *57,879*.

Pittston, *t.*, Penns., U.S.A.; anthracite, coal, machin.; p. (1960) *12,407*. [*716,837*.

Piura, *N. dep.*, Peru; a. 15,190 sq. m.; p. (1961)

Piura, *t.*, Peru; p. (1961) *32,100*.

Pladju, *t.*, S. Sumatra, Indonesia; oil refining; linked by pipe-line with Tempino and Bejubang.

Plainfield, *c.*, N.J., U.S.A.; sub. New York City; printing, motor lorries, machin., chemicals, hosiery; p. (1960) *45,330*.

Plaistow, *dist.*, E. London, Eng.; p. (1961) *10,424*.

Planitz, *t.*, Saxony, Germany; S.W. of Zwickau; textiles, tobacco; p. (estd. 1954) *25,100*.

Plate R., or **Rio de la Plata**, estuary of the Rs. Paraná and Uruguay flowing to the Atlantic between Argentina and Uruguay, length 170 m.; width at head 25 m., at mouth 138 m.

Plattsburg, N.Y., U.S.A.; pt. of L. Champlain; tourist ctr.; military post; p. (1960) *20,172*.

Plauen, *t.*, Karl-Marx-Stadt, E. Germany; textiles, machin., cable, leather, paper, radios; rly. junction; p. (1963) *79,111*.

Plenty, Bay of, N.I., N.Z.; on E. cst.; 130 m. wide.

Plettenberg, *t.*, N. Rhine–Westphalia, Germany; on R. Lenne; iron wks.; p. (1963) *29,000*.

Pleven, *fortfd. t.*, Bulgaria; many mosques; famous siege 1877; woollens, silks, wines; p. (1956) *57,758*.

Plock, *t.*, Poland; on R. Vistula, nr. Warsaw agr.; oil refinery and petrochemical plant; p. (1965) *54,000*.

Ploesti, *t.* Prahova dist., Romania; petroleum, engin.; p. (1963) *170,894*.

Plovdiv (Philippopolis), *c.*, Bulgaria; on R. Marica; univ., Greek cath.; wheat, fruit, silks, woollens, tobacco, leather, attar of roses; p. (1956) *162,518*.

Plumstead, *dist.*, S.E. London, Eng.

Plymouth, *c.*, *spt.*, *co. bor.*, S. Devon, Eng.; on Plymouth Sound; comprises the "three towns" of Plymouth, Devonport and Stonehouse; R.C. cath., guildhall, museum; shipbldg.; seaside resort; fishing and fish canning, light inds.; p. (1961) *204,279*.

Plymouth, *spt.*, Mass., U.S.A.; Pilgrim Hall, Pilgrim Fathers landed in 1620 from *Mayflower*, established first English colony; textiles, cordage, machin., cottons, woollens; p. (1950) *10,540*.

Plymouth, *ch. t.*, Montserrat I., T.W.I.; p. (1957) *2,500*.

Plymouth, *t.*, Penns., U.S.A.; coal; p. (1960) *10,401*.

Plynlimmon, *mtn.*, Montgomery and Cardigan, Wales; alt. 2,469 ft.

Plzen (Pilsen), *t.*, ČSSR.; coal, iron ore, steel, engin., chemicals; p. (1965) *142,000*.

Po, *R.*, Italy; flows from Monte Viso, through Piedmont and Lombardy to the Adriatic; length, 340 m.; natural gas deposits Po valley.

Pocatello, *t.*, Idaho, U.S.A.; rly. wks.; livestock; cheese; p. (1960) *28,534*.

Pocklington, *mkt. t., rural dist.*, E.R. Yorks, Eng.; at foot of York Wolds, 12 m. E. of York; milling, malting, bricks, tiles, agr.; p. (rural dist. 1961) *13,933*.

Podolsk, *t.*, R.S.F.S.R.; S. of Moscow; engin., tin smelting, cement; p. (1959) *124,000*.

Podrinye, *dist.*, W. Serbia, Jugoslavia; antimony.

Pohai (Chihli), G. of, N. China; together with G. of Liaotung forms shallow expanse of water almost cut off from Yellow Sea by Liaotung and Shantung peninsulas; receives water and silt of Hwang Ho; a. approx. 15,000 sq. m.

Pohjois Karjalan, *dep.*, Finland; p. (1961) *207,742*.

Point Clairette, Equatorial Africa; oilfield.

Point-à-Pierre, Trinidad; oil refinery; natural gas pipeline from Forest Reserve field.

Pointe-à-Pitre, *ch. t.*, Grande Terre I., Guadeloupe, Lesser Antilles; p. (1960) *26,160*.

Point-Claire, *t.*, Quebec, Canada; p. (1961) *22,709*.

Pointe-des-Galets, *ch. pt.*, Ile de la Réunion, Indian Ocean (Fr.).

Pointe-Noire, *impt. spt.*, Congo Rep. (ex-French), Equatorial Africa; aerodrome; copper ore, potash, timber, groundnuts; p. (1962) *54,643*.

Point Fortin, Trinidad; oil field and refinery.

Poitiers, *t.*, Vienne, France; univ.; Black Prince defeated French (1356); brewing, hosiery, cloth; p. (1962) *62,222*.

Pola, *see* Pula.

Poland, *rep.*, Europe; bounded by Germany, the Baltic Sea, Russia, and Czechoslovakia; largely lowland, rising from Baltic to Carpathians on S. border; ch. Rs.; Vistula and tribs.; climate: hot summers, very cold winters, moderate rainfall; good communications; agr.: cereals, potatoes, sugar-beet, forests, cattle, sheep, horses, pigs; minerals: coal, iron, steel, petroleum, natural gas, potash; cap. Warsaw; a. 121,131 sq. m.; p. (1965) *31,551,000*.

Pollokshields, *S.W. sub.*, Glasgow, Scot.; industl. and residtl.

Polotsk, *t.*, Byelorussian S.S.R.; cath.; gasoline prod., oil refining; oil pipeline to Latvian pt. of Ventspils; p. (1965) *35,100*.

Polotskiy, *t.*, Byelorussian S.S.R.; 8 m. W. of Polotsk; new oil workers' t. 1963.

Poltava, *industl. t.*, Ukrainian S.S.R.; horses, cattle, grain, engin., textiles; synthetic diamond plant; p. (1959) *141,000*.

Polynesia, *sub-div.*, Oceania; I. groups in Pacific within 30° N. and S. of the equator; between 135° E. and W. longitude.

Pomerania, *former prov.*, N. Germany; in post-war redivision part E. of R. Oder to Poland; part W. of R. Oder incorporated in *Land* Mecklenburg, E. Germany; farming, shipbldg. fishing.

Pomona or **Mainland,** lgst. of the Orkney Is., Scot. Kirkwall (cap.) and Stromness on I.

Pomona, *c.*, Cal., U.S.A.; fruit-culture; p. (1960) *67,157*.

Pomorze, *prov.*, Poland; cap. Bydgoszcz; a. 8,012 sq. m.

Pompeii, *ruined c.*, Italy; stood 13 m. S.E. of Naples, at foot of Vesuvius; destroyed A.D. 79 by volcanic eruption, site re-discovered in 1748; many most interesting excavations; also modern c. near by; fine church with famous collection of silver and gold plate.

Ponape I., Caroline Is., Pac. Oc.; copra, ivory, nuts, starch, bauxite; a. 134 sq. m.; p. (1958) *14,335*.

Ponca City, *t.*, Okla., U.S.A.; p. (1960) *24,411*.

Ponce, *c.*, Puerto Rico, W. Indies; coffee, sugar, rum; p. (1960) *114,965*.

Pondicherry, *cap.*, former Fr. Settlements in India; united with India 1954; cotton, rice; a. of dist. 185 sq. m.; p. (1961) *369,079*; of c. *40,421*.

Pont-à-Mousson, *t.*, Meurthe-et-Moselle, France; R. Moselle; ironwks., paper, velvet, cement wks.; p. (1954) *11,416*.

Ponta Delgada, *ch. t., spt.*, San Miguel I., Azores; p. (1960) *22,316*.

Ponta Grossa, *t.*, Paraná, Brazil; rly. junction; maté, rice, timber, tobacco, bananas, cattle, jerked beef; p. (1960) *77,803*.

Pontardawe, *vil.*, Glamorgan, S. Wales; on R. Tawe, 9 m. N.E. of Swansea; zinc smelting and refining, steel wks.

Pontchartrain, Lake, *shallow lake*, lower Mississippi flood plain, U.S.A., connected by canal to New Orleans which lies 6 m. to the south, and by deltaic channels to the gulf of Mexico.

Pontefract, *t., mun. bor.*, W.R. Yorks, Eng.; 7 m. E. of Wakefield; cas. ruins; coal, furniture, confectionery; p. (1961) *27 114*.

Pontevedra, *prov.*, Spain, on Atl. cst., bordering Portugal; agr., livestock, fisheries; cap. Pontevedra; a. 1,695 sq. m.; p. (1959) *736,069*.

Pontevedra, *spt.*, cap. Pontevedra prov.; Spain; fishing; p. (1949) *46,168*.

Ponthierville, *t.*, Congo, Africa; nr. Stanley Falls, Congo R.; p. *1,000*.

Pontiac, *c.*, Mich., U.S.A.; on Clinton R.; fishing and shooting, motor cars, rubber goods, machin., varnish; p. (1960) *82,233*.

Pontianak, *t., cap.*, Kalimantan, Indonesia; exp. rubber, copra; p. (1961) *150,220*.

Pontine Is., off W. cst. of Italy; in Tyrrhenian Sea; a. 4½ sq. m.; p. *6,000*.

Pontine Marshes, *region*, Latium, S. Italy; coastal zone S.E. of Rome extending from Velletri to Terracina; formerly highly malarial fens, largely drained and colonised 1930–35; 3,200 new farms, 4 new ts.; ch. t. Littoria; a. *c.* 250 sq. m.

Pontresina, *t.*, Grisons, Switzerland; E. of St. Moritz; tourist resort.

Pont-y-mister, *vil.*, Monmouth, Eng.; in valley of R. Ebbw, 6 m. N.W. of Newport; lge. steel-wks., zinc refineries.

Pontypool, *t., urb. dist.*, Monmouth, Eng.; coal, iron, steel, glass, bricks, tin galvanising, nylon at Manhilad; p. (1961) *39,879*.

Pontypridd, *t., urb. dist.*, Glamorgan, Wales; on R. Taff, 12 m. N.W. of Cardiff; coal, iron; p. (1961) *35,536*.

Ponza I., Pontine Is., Italy; wine, wheat, flax; fishing; bentonite-mining; a. 3 sq. m.

Poole, *mkt. t., spt., mun. bor.*, E. Dorset, Eng.; on Poole Harbour, 4 m. W. of Bournemouth; seaplane base; yachting; marine engin., tent mkg., bricks, chemicals; p. (1961) *88,088*.

Poona, *t.*, Maharashtra, India; univ.; cotton, sugar, rice; p. (1961) *737,426*.

Poopo, *L.*, Oruro dep., Bolivia; S. America; situated in Andes at alt. 12,120 ft.; very shallow; fed from L. Titicaca by R. Desaguadero, which flows over saline beds; no outlet, therefore salt-water; max. length 50 m., width 30 m.

Popayan, *cap.*, Cauca Dep., Columbia; cath., univ.; gold, silver, platinum, copper near by; p. (estd. 1959) *57,770*.

Poperinghe, *t.*, W. Flanders, Belgium.; woollens linens, hops; p. (1962) *12,409*.

Poplar, *see* Tower Hamlets.

Popocatepetl, *volcano*, nr. Pueble, Mexico; alt. 17,887 ft.

Porbandor, *spt.*, Gujarat, India; cement, silk, cotton; imports coal, dates, timber, machin., petroleum; birthplace of Mahatma Gandhi; p. (1961) *75,081*.

Porcupine Hills, *t.*, Ont., Canada; on rly. 40 m. S. of Cochrane; ctr. of impt. gold-mng dist.

Pordenone, *dist.*, *t.*, within Friuli-Venezia Giulia reg.; Italy; cath; cottons, silks, pottery.

Pori (Björneborg), *spt.*, S. Finland; at mouth of R. Kokemäen; copper refinery, rolling mills, match, paper and pulp wks.; p. (1961) *54,230*.

Porjus, *t.*, Norrbotten, N. Sweden; on R. Lulea, where it leaves Stora Lulevatten; impt. hydro-elec. power-sta. supplies power to iron-ore mining dists. of Gällivare and Kiruna, also to Narvik rly.

Porrentruy, *t.*, Berne, Switzerland; watches; p. *6,121*.

Porsgrunn, *spt.*, Norway; timber, shipping, engin., porcelain, explosives; p. (1961) *10,604*.

Port Alfred, *pt.*, Canada; Upper St. Lawrence R.; imports bauxite for smelting at Arvida (lgst. smelter in world, 1959).

Port Alfred, *t.*, Cape Province, S. Africa; resort; p. (1960) *6,171* (inc. *1,112* whites).

Port Amelia, *spt.*, Mozambique; sisal, coconuts, cotton, maize, groundnuts; p. (1960) *55,902*.

Port Antonio, *t.*, Jamaica, W. Indies; p. *5,482*.

Port Arthur, *c.*, S.W. Liaoning prov., China; naval base at entrance to Pohai R.; p. (estd.) *200,000*. *See* Luta.

Port Arthur, *L. pt.*, Ontario, Canada; on N.W. cst. of L. Superior; lumbering, mining, grain-milling, exp. ctr.; p. (1961) *45,276*.

Port Arthur, *t.*, Texas, U.S.A.; p. (1960) *66,676*.

Port Arzew, *pt.*, Algeria; world's 1st comm. plant to liquefy natural gas for exp. opened 1964; oil pipeline from Haoud el Hamra projected.

Port Assab, *t.*, Ethiopia; oil refining.

Port au Prince, *spt.*, Haiti, W. Indies; coffee, cacao; p. (estd. 1964) *200,000*.

Port Augusta, *t.*, *spt.*, S. Australia; at head of Spencer G.; fine harbour; salt field; exp. wheat, fruit; p. (1961) *9,705*.

Port Blair, *spt. cap.*, Andaman and Nicobar Is. p. (estd.) *16,000*.

Port Chalmers, *t.*, *bor.*, S.I., N.Z.; docks, ship-[yards; p. (1961) *3,120*.

Port Chester, *t.*, N.Y., U.S.A.; on Long I. Sound; summer resort, cottons and woollens; p. (1960) *24,960*.

Port Colborne, *t.*, Ont., Canada; port on L. Erie; iron smelting; nickel, copper refining; p. (1961) *14,886*.

Port Elizabeth, *spt.*, Cape Province, S. Africa; on Algoa Bay; exp. skins, wool, ostrich feathers, mohair; foundries, soap, chemicals, car assembly, food preservation, sawmills; p. (1960) *270,815* (inc. *94,085* whites).

Port Erin, *vil.*, I. of Man, Eng.; on S.E. cst.; seaside resort, fisheries.

Port Essington, *N. point*, of Coburg Peninsula, N. Terr., Australia.

Port Francqui, *t.*, Congo; present terminus of Congo rly. on Kasai R.; p. *5,000*.

Port Gentil, *spt.*, Gabon, Eq. Africa; exp. palm oil, mahogany, ebony; sawmills, fishing; oil refinery under construction; p. *5,000*.

Port Glasgow, *burgh*, *spt.*, Renfrew, Scot.; on S. bank of R. Clyde, 17 m. below Glasgow; shipbldg. and repairing, textiles, rope, canvas mftg.; p. (1961) *22,551*.

Port Harcourt, *spt.*, Nigeria; 30 m. from sea on E. branch of Niger delta; terminus of E. Nigerian rly. system; tin, palm oil, groundnuts; bitumen plant, tyres; oil refining; p. (1953) *72,000*.

Port Hedland, *sm. spt.*, W. Australia; on N.W. cst. 285 m. S.W. of Broome; exp. gold and other metals from Pilbarra gold-field; imports food and machin.; linked to Marble Bar by narrow-gauge rly.

Port Herald, *see* Nsanje.

Port Hope, *t.*, Ont., Canada; midway along N. shore of L. Ontario, fruit, dairying, radium refining; p. (1961) *8,091*.

Port Hunter, N.S.W., Australia; port for New-[castle.

Port Huron, *t.*, Mich., U.S.A.; on L. Huron; summer resort, mineral springs, dry docks, grain elevators; motor-car parts; p. (1960) *36,084*.

Port Jackson, N.S.W., Australia; *natural harbour* [for Sydney.

Port Kembla, *spt.*, N.S.W., Australia; S. of Wollongong; iron and steel wks., gold refining, textiles.

Port Laoighise, *mkt. t.*, Laoighis, Ireland; corn-[mills; p. (1961) *3,133*.

Port Lincoln, *spt.*, S. Australia; exp. wheat, frozen meat, tallow, wool; p. (1961) *7,651*.

Port Louis, *c. cap.*, Mauritius, Indian Ocean; ch. comm. ctr. of col.; p. (1962) *89,096*.

Port Lyautey (Kenitra), *see* Mina Hassan Tani.

Port Macquarie, *t.*, N.S.W., Australia; on Hastings R.; p. (1947) *2,906*.

Port Mahon, *see* Mahon.

Port Moody, *terminus*, Canadian Pacific Rly., Vancouver, Brit. Columbia; p. *1,512*.

Port Moresby, *spt.*, *ch. t.*, Papua, New Guinea; promising copper deposits; exp. copra, sandalwood, coffee, rubber, shell; univ.; p. (estd. 1963) *14,000*.

Port Natal, *see* Durban.

Port Nelson, *spt.*, Manitoba, Canada; on cst. of Hudson Bay at mouth of R. Nelson; linked by rly. to trans-continental systems via The Pas; exp. wheat, minerals; closed by ice for 7 months each year.

Port Nolloth, *spt.*, Cape Province, Rep. of S. Africa; pt. serving copper- and diamond-mining dists.

Port of Spain, *cap.*, Trinidad, W.I.; cocoa, sugar, asphalt; natural gas pipeline from Penal; p. (estd. 1963) *94,000*.

Port Phillip, *lge. inlet*, Victoria, Australia; land locked bay, with Melbourne on N., Geelong on W.

Port Pirie, *spt.*, S. Australia; smelting ores, gold refining; exp. wheat, minerals; p. (1961) *14,190*.

Port Radium, *t.*, N.W. Terr., Canada; on Gr. Bear L.; pitchblende deposits; p. *300*.

Port Royal, *t.*, Jamaica, West Indies; nr. Kingston; dock-yard.

Port Said, *spt.* U.A.R.; N. end Suez Canal; Free Trade a.; coaling sta.; p. (1960) *246,000*.

Port St. Mary, *vil.*, I. of Man, Eng.; on S.E. cst.; resort; fisheries, boat-bldg.

Port Shepstone, *t.*, Natal, S. Africa; sugar, bark, fibre, maize, fruit, dairying, poultry; cement; p. (1960) *4,238* inc. *1,775* whites.

Port Sudan, *spt.*, Sudan; 30 m. N. of Suakin; linked by rail to Atbara and Khartoum; oil refining; p. (1960) *51,790*.

Port Sunlight, Cheshire, Eng.; modern garden village founded 1888 by Lord Leverhulme for the employees of Lever Brothers' Port Sunlight factories; p. *6,000*.

Port Swettenham, *spt.*, Selangor, Malaysia; exp. tin, rubber, copra, pineapples; p. *11,300*.

Port Talbot, *t.*, *mun. bor.*, Glamorgan, S. Wales; on E. side of Swansea Bay; impt. iron and steel ind., copper, coal; harbour projected; p. (1961) *50,223*.

Port Taufiq, *spt.*, U.A.R.; S. end of the Suez canal; p. *1,000*.

Port Vendres, *spt.*, Pyrénées-Orientales, France; nr. Perpignan; p. (1954) *4,180*.

Portadown, *t.*, *mun. bor.*, Armagh, N. Ireland; on R. Bann, 25 m. S.W. of Belfast; linen, lace, farming; p. (1961) *18,605*.

Portaferry, *spt.*, Down, N. Ireland; shipping, fisheries; p. (1961) *1,406*.

Portage, *t.*, Wis., U.S.A.; iron; p. (1960) *7,822*.

Portage la Prairie, *spt.*, Manitoba, Canada; grain exp.; p. (1961) *12,388*.

Portalegre, *t.*, Portugal; cath.; mkt.; p. (1960) *11,017*.

Portarlington, *t.*, Offaly, Ireland; farming; first place to have elec. power-sta. using local peat fuel; p. (1951) *2,246*.

Portbou, *t.*, on Fr. side of Franco–Spanish border, opposite Rosas on Mediterranean cst.

Porthcawl, *t.*, *urb. dist.*, Glam., Wales; on cst. 10 m. S.E. of Pt. Talbot; resort; p. (1961) *11,082*.

Portici, *spt.*, Campania, S. Italy; on Bay of Naples 5 m. S.E. of Naples; dockland sub. of Naples; p. (1961) *50,373*.

Portishead, *t.*, *urb. dist.*, Somerset, Eng.; on Severn estuary 3 m. S.W. of Avonmouth; shipping; p. (1961) *6,440*.

Portknockie, *burgh*, Banff, Scot.; on N. Buchan cst., 5 m. E. of Buckie; sm. fishing pt.; p. (1961) *1,245*.

Portland, *urb. dist.*, Dorset, Eng.; 4 m. S. of Weymouth on sheltered N.E. side of I. of Portland; lge. artificial harbour; p. (1961) *11,542*.

Portland, *t.*, *spt.*, Me., U.S.A.; comm. cap. of Me.; lge. fisheries; paper, pulp, lumber, processed food, clothing; p. (1960) *72,566*.

Portland, *c.*, Ore., U.S.A.; gr. wheat and wool tr.; flour milling, shipbldg., fishing and canning, aluminium, lumber; p. (1960) *372,676*.

Portland Canal, *fjord*, N.W. cst. of America, forming boundary between Alaska and B.C.

Portland, I. of, *peninsula*, Dorset, Eng.; limestone mass, linked to mainland by shingle spit, Chesil Bank, terminates S. in Portland Bill; naval base, prison, Borstal inst.; limestone quarrying; masonry wks.

Portmadoc, *spt.*, *urb. dist.*, Caernarvon, Wales; on Tremadoc Bay; linked by light rly. to Ffestiniog; copper and slate exp.; p. (1961) *3,419*.

Porto, *see* Oporto.

Porto Alegre, *c.*, *cap.*, Rio Grande do Sul st., Brazil; exp. lard, preserved meats, rice, timber, tobacco; textiles, chemicals, furniture, brewing, metallurgy; p. (1960) *641,173*.

Porto Empedocle, *spt.*, Sicily, Italy; sulphur refining, flour, furniture, lime, gypsum; p. *14,764*.

Porto Marghera, *spt.*, Venezia, N. Italy; extends along cst. S. from landward end of the causeway linking Venice to the mainland; the modern pt. of Venice, reached by ship canal dredged through shallow lagoon; oil-refineries.

Porto Novo, *t., cap.*, Dahomey, W. Africa; nr. Bight of Benin; p. (1965) *65,000*.
Porto Vecchio, *t.*, Corsica; on E. cst.; p. *5,304*.

Rewari, *t.*, Punjab, India; S.W. of Delhi; turban and brass-ware mnfs.; p. (1961) *36,994.*

Reykjavik, *c.*, *cap.*, Iceland; on S.W. cst.; univ., cath.; exp. fish, skins, wool; aluminium smelting at Straumsvik nearby; p. (1962) *74,978.*

Rezayeh, *c.*, Iran; prov. cap. W. Azarbayejan; p. (1967) *291,369.*

Rezé, *t.*, Loire Atlantique, France; p. (1954) *19,000.*

Rheine, *t.*, N. Rhine–Westphalia, Germany; on R. Ems; textiles, machin.; p. (1963) *46,400.*

——— ——— *t.*, N. Rhine-Westphalia, Germany; on R. Rhine; S. of Duisburg; coal-mining, iron, textiles; p. (1963) *70,500*.

Rheinkamp (Repelen-Baerl before 1950), *t.*, N. Rhine-Westphalia, Germany; on R. Rhine, N.W. of Duisberg; coal-mng.; p. (1963) *38,900*.

Rheydt, *t.*, N. Rhine-Westphalia, Germany; W. of Düsseldorf; textiles, machin., rly. junction; p. (1963) *96,000*.

Rhin (Bas), *dep.*, N.E. France; cap. Strasbourg; a. 1,848 sq. m.; p. (1962) *770,150*.

Rhin (Haut), *dep.*, N.E. France; cap. Colmar; a. 1,354 sq. m.; p. (1962) *547,920*.

Rhine, *R.*, rises in Switzerland, can. Grisons, passes through L. Constance, skirts Baden, traverses Hesse, Rhineland, and the Neth., flowing to N. Sea by two arms, Oude Rijn and the Waal (the latter discharging finally by the Maas); famous for its beauty, especially between Bonn and Bingen; ch. falls at Schaffhausen; once a natural barrier between E. and W. Europe, the Rhine is now spanned by 30 rly. bridges, and its navigation declared free in 1868; length 800 m.

Rhineland Palatinate (Rheinland-Pfalz), *Land*, Germany; a. 7,665 sq. m.; cap. Mainz; p. (1961) *3,417,000*.

Rhinns (Rins), *peninsula*, on W. cst. Islay I., Inner Hebrides, Scot.; lighthouse.

Rhio-Lingga Archipelago, *gr. of Is.*, Indonesia; mainly in Malacca Strait; a. 12,235 sq. m.

Rhode Island, *st.*, New England, U.S.A.; washed by the Atlantic, and surrounded by Massachusetts and Connecticut; divided by Narragansett Bay, with many islands, lgst. being that from which the st. takes its name; jewellery, silverware, textiles, rubber, granite; agr., fisheries; cap. Providence; a. 1,214 sq. m.; p. (1960) *859,488*.

Rhodes (Rhodos), *I.*, Dodecanese Is.; off S.W. cst., Anatolia, belonging to Greece; cap. R.; figs, oranges, grapes; p. (1940) *61,791*.

Rhodes, *t.*, *cap.*, I. of Rhodes, Greece; on N.E. cst.; p. (1951) *24,186*.

Rhodesia, *self-gov. Brit. col.* central Africa; tobacco, maize, fruit, cattle; gold, coal, asbestos, chrome ore; crystalline graphite ore deposits being developed; cap. Salisbury; a. 150,333 sq. m.; p. (estd. 1965) *4,210,000*.

Rhodope Mtns., *range*, S. Bulgaria; rise to 10,200 ft.

Rhodopi, *prefecture*, Thrace, Greece; cap. Komotini; p. (1961) *109,194*.

Rhöngebirge, *mtn. gr.*, Thuringia, Germany; highest peak 3,100 ft.

Rhondda, *t.*, *urb. dist.*, Glamorgan, Wales; in narrow Rhondda valley, 7 m. N.W. of Pontypridd; coal-mining; p. (1961) *100,314*.

Rhône, *R.*, Switzerland and France; rising in the Rhône glacier of the St. Gotthard mtn. gr., and flowing through the L. of Geneva and E. France to the G. of Lyons in the Mediterranean; length 507 m.; power stas. at Sion and Geneva; canals, dams, locks and power stas. form part of French Rhône Valley project (1937–72).

Rhône, *dep.*, S.E. France; drained by R. Rhône, and its trib. R. Saône, which unite at Lyons; agr., grain, potatoes, wine; vine-growing, many mnfs., silks, textiles; cap. Lyons; a. 1,104 sq. m.; p. (1962) *1,116,664*.

Rhyl, *t.*, *urb. dist.*, Flint, N. Wales; between Bangor and Chester, at entrance Vale of Clwyd resort; furniture mkg.; p. (1961) *21,825*.

Rhymney, *t.*, *urb. dist.*, Monmouth, Eng.; on R. Rhymney, 4 m. E. of Merthyr Tydfil; mining p. (1961) *8,853*.

Rialto, *I.* and *dist.* on Grand Canal, Venice; ctr. of comm.

Ribadesella, *spt.*, Spain; W. of Santander iron mines; p. (1957) *7,692*.

Ribatejo, *prov.*, Portugal; a. 2,794 sq. m.; p. (1950) *459,853*.

Ribe, *mkt. t.*, Jutland, S. Denmark; on W. cst., iron wks.; p. (1960) *7,809*.

Ribble, *R.*, Yorks and Lancs, Eng.; followed by main rly. route Leeds to Carlisle; length 75 m.

Ribeira, *t.*, Galicia, Spain; on peninsula of Arosa estuary; agr., cattle-rearing, fishing.

Ribeirão Preto, *c.*, S.E. Brazil; mkt. in rich agr. a. esp. coffee, cotton, sugar; p. (1960) *116,153*.

Riberalta, *R. pt.*, Colonia Terr., Bolivia, S. America; on R. Beni above rapids which limit navigation to upper course; collecting ctr. for wild rubber.

Richborough, *pt.*, Kent, Eng.; at mouth of R. Stour; pt. was derelict but now being developed as a private pt.; chemicals, antibiotics.

Richelieu or Chambly, *R.*, Quebec, Canada; flows from L. Champlain to the St. Lawrence R. at L. St. Peter; length 80 m.

Richmond-upon-Thames, *outer bor.*, Greater London, Eng.; inc. former bors. of Barnes, Richmond and Twickenham; industl. and residtl.; beautiful park and riverside scenery; p. (1964) *181,581*.

Richmond, *t.*, *mun. bor.*, N.R. Yorks, Eng.; at E. foot of Pennines on R. Swale; p. (1961) *5,764*.

Richmond, *t.*, Cal., U.S.A.; oil refining; p. (1960) *71,854*.

Richmond, *c.*, Ind., U.S.A.; on R. Whitewater; mnfs.; p. (1960) *44,149*.

Richmond, *c.*, Ky., U.S.A.; in tobacco-growing and horse-rearing region; p. (1960) *12,168*.

Richmond, one of the five bors. of New York City, U.S.A.; p. (1957) *210,146*.

Richmond, *c.*, *cap.*, Va., U.S.A.; on falls on R. James; gr. tobacco mftg. ctr. and mart; chemicals, iron and steel, lumber; p. (1960) *219,958*.

Rickmansworth, *mkt. t.*, *urb. dist.*, Herts, Eng.; at confluence of Rs. Colne and Chess, 3 m. S.W. of Watford; paper, brewing; residtl.; p. (1961) *28,442*.

Rideau Canal, Canada; from Ottawa R., to Kingston on L. Ontario; length 132 m.

Ridgefield, *t.*, N.J., U.S.A.; p. (1960) *10,788*.

Ridgewood, *t.*, N.J., U.S.A.; p. (1960) *25,391*.

Riesa, *t.*, Dresden, E. Germany; on R. Elbe, nr. Meissen; steel wks., sawmills; p. (1963) *38,929*.

Riesengebirge, *mtns.*, Germany; (Czech Krkonose, Polish Karkonesze).

Riesi, *t.*, Sicily, Italy; industl.; p. *20,200*.

Rieti, *t.*, Perugia, Italy; an ancient Sabine t. in famous fertile dist.; mnfs.; p. (1961) *34,580*.

Riff (Er Rif), *mtns.*, Morocco, N.W. Africa; extend E. along N. African cst. for 200 m. from Straits of Gibraltar; inaccessible and economically unattractive, terr. of semi-nomadic tribes; rises to over 7,000 ft. in many places.

Riga, *cap.*, Latvian S.S.R.; at head of G. of Riga; gr. industl. activity; machin., glass, paper, cottons; rly. and shipbldg., exp. wheat, flax, hemp, dairy produce; p. (1962) *620,000*.

Rigi, *mtn.*, nr. L. Lucerne, Switzerland; alt 5,905 ft.

Rijeka-Susak, *t.*, Jugoslavia; formerly Fiume; belonged to Austria-Hungary before First World War, then to Italy; ceded to Jugoslavia by Italy after Second World War; rival pt. to Trieste; petrol refining, tobacco, chemicals, hydro-elec., shipbldg.; p. (1959) *87,000*.

Rimac, *R.*, Lima dep., Peru; S. America; rises in W. cordillera of Andes and flows W. to Pac. Oc.; provides water for irrigation and for c. of Lima; length 75 m.

Rimini, *t.*, Emilia, Italy; on the Adriatic cst.; mineral springs, sea-bathing, thriving inds.; p. (1961) *92,912*.

Rimnic, *t.*, Romania; on R. Rimnic, nr. Bucharest; industl; p. (1963) *22,242*.

Rimouski, *t.*, Quebec, Canada; on S. bank St. Lawrence R.; lumber; tourists; p. (1961) *17,739*.

Ringerike, *c.*, Buskerud, Norway; new c. 25 m. N.W. of Oslo and inc. former t. of Hönefoss; p. (1965) *27,900*.

Ringköbing Fjord, *inlet*, W. cst. Jutland, Denmark.

Ringwood and Fordingbridge, *mkt. t.*, *rural dist.*, Hants, Eng.; on R. Avon, nr. Christchurch; p. (rural dist. 1951) *23,908*.

Rio Branco, *R.*, Brazil; prov. Baia, trib. of Rio Grande; length 120 m.

Rio Branco, *R.*, N. Brazil; flowing to Rio Negro; length 370 m.

Rio Branco, *t.*, cap. of Acre st., Brazil; p. (1960) *47,882*.

Rio Branco, *terr.*, Brazil; cap. Boa Vista; a. *82,749* sq. m.; p. (1960) *29,489*.

Rio Cuarto, *t.*, Cordoba prov., Argentina; agr. ctr.; p. (1960) *70,000*.

Rio das Mortes, *R.*, Brazil; trib. of the Araguay; length 500 m.

Rio de Janeiro, *maritime st.*, Brazil; a. 16,443 sq. m.; coffee plantations, sugar, cotton, tobacco; thorium; cap. Niterói; p. (1960) *3,402,728*.

Rio de Janeiro, *c.*, *spt.*, former fed. cap. Brazil; on Bay of Rio de Janeiro; many fine bldgs., flourishing tr. and inds.; rly. wks.; shipyards; mnfs. iron, steel, cement, textiles, sugar, tyres, pharmaceutics, china, sheet glass; p. (1960) *3,307,163*.

Rio de la Plata, *see* **Plate R.**

Rio de Oro, *prov.*, Spanish Sahara; a. 70,000 sq. m.
Rio de San Juan, *R.*, Utah, New Mexico and Colorado, U.S.A.; length 350 m.
Rio Dulce, *R.*, Santiago st., Argentina; length [400 m.
Rio Grande, *headstream* of the R. Paraná, Brazil.
Rio Grande City, *t.*, S. Texas, U.S.A.; on Rio Grande R.; mkt., agr., oil, natural gas; p. (1960) *5,835.*
Rio Grande de Santiago, *R.*, Mexico; flows into the [Pacific.
Rio Grande del Norte, *R.*, flows from st. of Colorado through New Mexico to the G. of Mexico; forms bdy. between Texas, U.S.A. and Mexico; length 1,800 m.
Rio Grande do Norte, *st.*, Brazil; sugar, cotton, cattle-rearing; cap. Natal; a. 20,482 sq. m.; p. (1960) *1,157,258.*
Rio Grande do Sul, *st.*, S. Brazil; cap. Porto Alegre; a. 109,067 sq. m.; p. (1960) *5,448,823.*
Rio Grande do Sul, *spt.*, Brazil; textiles, oil refining; cattle, agr.; p. *45,000.*
Rio Muni, *Span. overseas prov.* (aut. status granted 1963), W. Africa, on cst. between Cameroun and Congo; with Fernando Po and other Is. forms col. of Span. Guinea; ch. t. Bata; cacao, palm oil, coffee; a. 10,000 sq. m.; p. (1963) *200,000.*
Rio Negro, *R.*, Argentina; rises in the Andes, and flows through the terr. of Rio Negro to the Atlantic; length 650 m.
Rio Negro, *prov.*, Argentina; S. of Pampa; cap. Viedma; cattle-rearing region; a. 77,610 sq. m.; p. (1960) *193,000.*
Rio Negro, *R.*, S. America; rises in Colombia, and flows through N. Brazil to the Amazon; length 1,350 m.
Rio Negro, *dep.*, Uruguay; cap. Fray Bentos; a. 3,269 sq. m.; p. (1953) *51,954.*
Rio Piedras, *t.*, Puerto Rico, W. Indies; univ.; merged with San Juan 1951.
Rio Salada, *R.*, Argentina; rises in the Andes, and flows S.E. to R. Paraná, at Buenos Aires; length 1,000 m.
Rio Tinto, *t.*, Spain; at W. end of Sierra Morena, 40 m. N.E. of Huelva; lead- and copper-mines; p. (1957) *10,000.*
Riobamba, *c.*, Chimborazo, Ecuador; on R. St. Juan; woollens, cotton gds., cement, ceramics; Inca palace ruins; p. (estd. 1960) *35,099.*
Rioja, *region*, N. Spain, Upper Ebro; famous for wines, orange groves; ch. ctr. Logroño.
Rioja, La, *prov.*, Argentina; gold- and copper-mines; cap. La Rioja; a. 33,394 sq. m.; p. (1960) *128,000.*
Riom, *t.*, Puy-de-Dôme, France; nr. Clermont Ferrand; p. (1954) *12,664.*
Rion, *R.*, Georgian S.S.R.; flows from Caucasus to Black Sea; lower half navig.; hydro-elec. sta. at Kutais. (In Greek mythology the R. Phasis of the Argonauts.)
Rionero, *t.*, Potenza prov., S. Italy; nr. Melfi; industl.; p. *12,025.*
Ripley, *mkt. t., urb. dist.*, Derby, Eng.; 7 m. N.E. of Derby; coal, iron, heavy engin., bricks, agr. implements; p. (1961) *17,601.*
Ripley, *t.*, W. Tenn., U.S.A.; lumbering; veneer; cottonseed processing; p. (1960) *3,782.*
Ripon, *c., mun. bor.*, W.R. Yorks, Eng.; on R. Ure; cath.; paint, varnish, prefabricated concrete structures; p. (1961) *10,490.*
Ripon, *t.*, Wis., U.S.A., on Green L., p. (1950) *5,619.*
Ripon Falls, *see* Jinja.
Riposto, *t.*, Sicily, Italy; on E. cst. nr. Taormina; ort; p. *10,725.*
urb. dist., W.R. Yorks, Eng.; nr. p. (1961) *5,765.*
Risca, *t., urb. dist.*, Monmouth, Eng.; on R. Ebbw, 5 m. N.W. of Newport; coal, iron and steel, bricks, tiles, plastics; p. (1961) *14,008.*
Rishton, *t., urb. dist.*, Lancs, Eng.; at N. foot of Rossendale Fells, 4 m. N.E. of Blackburn; p. (1961) *5,431.*
Risley, nr. Warrington, Lancs., Eng.; headquarters of Engineering Group of U.K. Atomic Energy Authority; site of Manchester's New t.; proposed p. *50,000.*
Riva, *t.*, Trentino, Italy; battle zone in First World War, Nov.–Dec. 1915; p. *12,950.*
Rivas, *spt.*, Nicaragua, Central America; p. (1960) *19,159.*
Rive-de-Gier, *t.*, Loire, France; on R. Gier, nr. Lyons; mining ctr.; p. (1954) *15,118.*
Rivera, *dep.*, Uruguay; cap. Rivera; a. 3,793 sq. m.; p. (1953) *91,740.*

Riverina, *pastoral cty.*, N.S.W., Australia; between Lachlan-Murrumbidgee and Murray Rs.; sheep, agr. with irrigation; gold, coal; ch. ts., Wagga Wagga, Albury; a. 26,600 sq. m.; p. *71,000.*
River Rouge, *t.*, Mich., U.S.A.; p. (1960) *18,147.*
Riverside, *t.*, Cal., U.S.A.; p. (1960) *84,332.*
Riverside, *t.*, N.J., U.S.A.; p. (1960) *8,474.*
Riverside, *t.*, Ontario, Canada; p. (1961) *18,089.*
Riviera, the belt of cst. between the mtns. of the shore of the G. of Genoa, N. Italy, from Spezia to Nice; picturesque scenery, sheltered, mild climate; fashionable health resort.
Riyadh, *t., cap.*, Saudi Arabia; 230 m. inland from Persian G.; palace; univ.; p. (estd.) *300,000.*
Rizal, *prov.*, *t.*, central Luzon, Philippine Is.; chiefly agr.; food processing, steel mill, cement; a. 791 sq. m.; p. of t. (1960) *132,673.*
Rize, *t.*, Turkey; nr. Trabzon, on Black Sea; p. (1965) *27,069.*
Rjukan, *t.*, Telemark, S. Norway; 85 m. N.W. of Notodden, impt. nitrate factories; p. (1961) *5,637.*
Road Town, *spt. cap.*, Tortola and Virgin Is.; p. [(1960) *900.*
Roanne, *t.*, Loire, France; nr. St. Etienne; textile, cottons, woollens, silk; p. (1962) *53,203.*
Roanoke, *I.*, off cst. N.C., U.S.A.; 13 m. long.
Roanoke, *R.*, Va., and N.C., U.S.A.; flows into Albemarle Sound; length 230 m.
Roanoke, *t.*, Ala. U.S.A.; cotton mnfs., clothes; p. (1960) *5,288.*
Roanoke, *c.*, S.W. Va., U.S.A.; on R. R.; iron- [wks.; p. (1960) *97,110.*
Roaring Creek, Brit. Honduras, C. America; site of new cap. 50 m. inland, at junction of W. Highway with Hummingbird Highway.
Roatan Is., Honduras, in G. of H.
Robin Hood's Bay, *picturesque inlet with fishing vil. on cst.*, N.R. Yorks, Eng.; nr. Whitby.
Robson, Mt., Alberta, Canada, 12,972 ft.
Roca, C. da, most W. point of estuary of R. Tagus, Portugal.
Roch, *R.*, Lancs, Eng.; rises in E. of Rossendale Fells, central Pennines, flows S.W. into R. Irwell nr. Bury; with R. Calder provides relatively easy route across Pennines from Leeds to Manchester; used by rail, road, canal; length approx. 20 m.
Rocha, *dep.*, Uruguay; a. 4,280 sq. m.; cap. Rocha; p. (1953) *86,334.*
Rochdale, *t., co. bor.*, Lancs, Eng.; at S. foot of Rossendale Fells, on R. Roch; textiles, textile engin., rayon spinning, elec. engin.; co-operative movement started here, 1844; p. (1961) *85,785.*
Rochefort, *t.*, S. Belgium; p. (1962) *3,996.*
Rochefort, *fortfd. pt.*, Charente-Maritime, France; with arsenal and sm. cst. tr.; famous cheese; p. (1954) *30,858.*
Rochelle, La, *fortfd. spt., cap.*, Charente-Maritime, France; on Bay of Biscay; shipbldg., chemical wks., fisheries; p. (1954) *58,799.*
Roches Point, E. side of Cork harbour, Co. Cork, Ireland.
Rochester, *c., mun. bor.*, Kent, Eng.; on R. Medway, adjoining Chatham; cath., cas.; aeronautical, elec. and mechanical engin., paint, varnish; p. (1961) *50,121.*
Rochester, *c.*, Minn., U.S.A.; in grain-growing dist.; p. (1960) *40,663.*
Rochester, *t.*, N.H., U.S.A.; on Salmon Falls and Cocheco Rs.; boot factories; p. (1960) *15,927.*
Rochester, *c.*, N.Y., U.S.A.; on Genesee R.; univ.; hydro-elec. power; cameras, films, optical instruments, thermometers, electronic equipment; p. (1960) *318,611.*
Roche-sur-Yon, La, *t.*, Vendée, France; on R. Yon; cas.; called formerly Bourbon Napoleonville; p. (1954) *19,576.*
Rochford, *t., rural dist.*, Essex, Eng.; 3 m. N. of Southend; timber wharves, boat bldg., brick mkg.; p. (rural dist. 1961) *30,306.*
Rockall, *sm. I.*, N. Atl. Oc.; lies 200 m. W. of Outer Hebrides; forms highest part of submarine bank which forms good fishing-ground; uninhabited. Annexed by Britain, 1955.
Rockall Deep, *submarine trench*, N. Atl. Oc.; between N.W. Ireland and Rockall I.; depth exceeds 1,600 fathoms.
Rockaway, *bor.*, N.J., U.S.A.; iron founding and products; textiles, leather; p. (1960) *5,418.*
Rockaway Beach, *summer resort*, on sandbar of

Long I.; now incorporated with Queens, one of the 5 bors. of New York City, U.S.A.
Rockford, *c.*, Ill., U.S.A.; machin. and furniture mftg.; p. (1960) *126,706.*
Rockhampton, *c.*, Queensland, Australia; on R. Fitzroy; comm. cap. of Central Queensland. Has lgst. meat-preserving wks. in Commonwealth; mining; p. (1961) *44,102.*
Rock Hill, *c.* S.C., U.S.A.; industl.; p. (1960) *29,404.*
Rockingham, *t.*, N.C., U.S.A.; cotton mnfs., paper, lumbering, peaches; p. (1950) *3,356.*
Rock Island, *c.*, Ill., U.S.A.; on R. Mississippi; lumbering, flour mills, glass, farm implements; elec. equipment; p. (1960) *51,863.*
Rockland, *c.*, *spt.*, Ma., U.S.A.; on Penobscot Bay; shipbldg., granite quarrying; p. (1950) *9,234.*
Rockland, *t.*, Mass., U.S.A.; shoemkg., engin.; p. (1960) *13,080.*
Rock River, Wis., U.S.A.; trib. of the Mississippi; length 375 m.
Rockville, *c.*, Conn., U.S.A.; on Hockanum R.; silks, woollens; p. (1960) *9,478.*
Rocky Mount, *t.*, N.C., U.S.A.; p. (1960) *32,147.*
Rocky Mountains, *extensive chain*, N. America; extending along the W. portions of Canada and the U.S.A. from Alaska to Mexico; the highest accurately measured point in the U.S.A. system is Mt. Massive (14,418 ft.); other high peaks are Mt. Elbert (14,431 ft.), Blanca Peak (14,390 ft.), Mt. Harvard (14,399 ft.), La Plata Peak (14,340 ft.), and Mt. Uncompahgre (14,306 ft.), Mt. St. Elias, in Alaska, is computed to be 18,008 ft. high, and was long held to be the highest peak in N. America, but is now known to be surpassed by the adjacent Mt. Logan (19,850 ft.) and by Mt. Orizaba (18,701 ft.) in Mexico.
Rodas, *mun.*, Cuba; sugar; p. *21,238.*
Rödby, *t.*, Denmark; on S. cst. of Lolland; p. (1960) *3,551.*
Rodewisch, *t.*, Karl-Marx-Stadt, E. Germany; engin., textiles; p. (1963) *12,458.*
Rodez, *t.*, *cap.*, Aveyron, France; on R. Aveyron; cath.; woollens; p. (1954) *20,383.*
Rodosto, *see* Tekirdag.
Rodriguez, *I.*, British dependency of Mauritius, Indian Ocean; 350 m. N.E. of Mauritius; principal exp., cattle, beans, salt, fish and goats; 42 sq. m.; p. (1962) *18,300.*
Roebling, *t.*, N.J., U.S.A.; established by steel-cable mkg. company; p. (1960) *3,272.*
Roebourne, *spt.*, N.West cst. of W. Australia; iron-ore deposits.
Roermond, *t.*, Limburg, Neth.; on R. Maas; minster; paper, beer, cloth; p. (1967) *36,842.*
Roeselare, *t.*, W. Flanders, Belgium; on R. Lys, nr. Courtrai, cotton, linen, lace; p. (1962) *35,662.*
Roes Welcome, channel between Southampton I. and N.W. Terr. Canada.
Rogaland, *co.*, Norway; a. 3,546 sq. m.; p. (1963) [*244,103.*
Rogers, *t.*, Ark., U.S.A.; fruit, vegs.; tourists; p. (1960) *5,700.*
Rogerstone, *t.*, S. Monmouth, Eng., on R. Ebbw 3 m. W. of Newport; aluminium; p. (1951) *4,453.*
Rohtak, *t.*, Punjab, India; mkt., cotton textiles; fortifications; p. (1961) *88,193.*
Rokko, *C.*, Honshu, Japan; jutting into Sea of [Japan.
Rolphton, Ontario, Canada; nuclear power plant.
Roma, *t.*, Queensland, Australia; in agr. dist. nr. Mt. Horrible; natural gas; p. (1947) *3,880.*
Roman, *t.*, Romania; on R. Moldava; cath.; p. (1963) *45,930.*
Romania, *rep.*, E. Europe; bounded by U.S.S.R., Hungary, Jugoslavia and Bulgaria, consisting of provs. of Oltena, Muntenia (Wallachia), Dobrogea (Dobruja), Moldova (Moldavia), S. Bucovina, Transylvania, Banat, Crisana and Maramures; plain drained by Danube and tribs. Prut, Siret, Dambovita, Olt Jiu; except Transylvania, mountainous, Carpathians, Transylvanian Alps; very warm summers, severe winters, rainfall moderate, chiefly in summer; agr., maize, wheat, barley, oats; sheep, cattle, pigs, horses; forests, timber; minerals, petroleum, natural gas, lignite, copper, salt; flour-milling, brewing, distilling, oil-refining, chemicals; cap. Bucharest; a. 91,671 sq. m.; p. (1963) *18,813,131.*
Romans, *t.*, Drôme, France; on R. Isère; formerly seat of ancient abbey; p. (1954) *22,559.*
Romblon Is., *prov.*, of Philippine Is.; low, fertile; ch. crops, abaca and copra; gold, marble; a. 512 sq. m.; p. *99,367.*
Rome, *c.*, *cap.*, Italy; on R. Tiber, 15 m. from the sea; one of the most famous cities in the world; ctr. of the Roman Catholic Church and former cap. of the greatest st. in the ancient world; situated on the original "seven hills" of the old Roman metropolis, and in the valleys between, along the R.; contains the celebrated cath. ch. of St. Peter, in the Vatican City, many historical monuments, a univ. and several institutions devoted to art and learning; created cap. of mod. United Italy in 1871; mnfs. and tr.; p. (1964) *2,455,000.*
Rome, *c.*, Ga., U.S.A.; on Coosa R.; in cotton region; p. (1960) *32,226.*
Rome, *c.*, N.Y., U.S.A.; on the Mohawk R.; dairying ctr.; p. (1960) *51,646.*
Romford, *former mkt. t.*, *mun. bor.*, Essex, Eng.; 12 m. E. of London; now inc. in Havering bor. Greater London; brewing, light inds.; p. (1961) *114,584.*
Romilly-sur-Seine, *t.*, Aube, France; nr. Troyes; textile factories; p. (1954) *13,731.*
Romney, *see* New Romney.
Romney Marsh, *coastal marsh*, Kent, Eng.; formed by blocking of R. Rother by shingle spit of Dungeness which extends from Rye to Hythe; now largely drained; pastures for special Romney Marsh breed of sheep; a. 50 sq. m.
Romsdal, Möre Og, *dist.* Norway; cap. Molde; a. 5,812 sq. m.; p. (1961) *212,020.*
Romsey, *mun. bor.*, Hants, Eng.; on R. Test, 8½ m. N.W. of Southampton; mkt. ctr.; p. (1961) *6,229*; rural dist. with Stockbridge (1961) *21,615.*
Ronaldshay, N. and S., Is. of the Orkneys.
Roncesvalles, *mtn. pass.*, in the Pyrenees, Spain; 20 m. N.E. of Pamplona, Navarra; Charlemagne's army under Roland, who was slain, defeated here, 778.

Rovigo, *t.*, *cap.*, Rovigo prov., Italy; on R. Adige, 20 m. S. of Padua; agr. mkt.; p. (1961) *45,271.*

Rovno, *t.*, Ukrainian S.S.R.; 110 m. N.E. of Lvov; comm. ctr.; p. (1959) *57,000.*

Rowley Regis, *industl. t.*, *mun. bor.*, Staffs, Eng.; adjoins Dudley; p. (1961) *48,166.*

Roxboro', *t.*, N.C., U.S.A.; cotton, tobacco, mnfs.; p. (1950) *4,321.*

Roxburgh, *inland co.*, S. Scot.; stretching halfway along the Eng. border; hilly; sheep-rearing; woollens, tweed; cap. Jedburgh; a. 670 sq. m.; p. (1961) *43,171.*

Royal Leamington Spa, *see* Leamington.

Royal Oak, *t.*, Mich., U.S.A.; p (1960) *80,612.*

Royan, *t.*, Charente-Maritime, France; S. of Rochelle; fishery, tr., industl.; p. (1954) *12,289.*

Royersford, *bor.*, S.E. Penns., U.S.A.; light iron and steel mnfs.; glass; p. (1950) *3,862.*

Royston, *mkt. t.*, *urb. dist.*, Herts, Eng.; at N. foot of E. Anglian Heights, 7 m. N.E. of Baldock; p. (1961) *6,166.*

Royston, *urb. dist.*, W.R. Yorks, Eng.; coal-mining; p. (1961) *8,490.*

Royton, *t.*, *urb. dist.*, Lancs, Eng.; 4 m. N.E. of Manchester; cotton spinning; p. (1961) *14,476.*

Roznava, *t.*, ČSSR.; W. of Košice; antimony; p. (1961) *10,227.*

Ruabon, *par.*, Denbigh, N. Wales; on Salop border; coal, iron, tile wks., chemicals; p. *3,333.*

Ruanda-Urundi, *see* Rwanda and Burundi.

Ruapehu, *highest mtn.*, N.I., N.Z.; volcanic peak at S. extremity of central volcanic dist.; alt. 9,175 ft.

Rubicon, *R.* of Central Italy, flowing to the Adriatic, crossed by Julius Caesar and his armies in 49 B.C. Has been identified with the Fiumicino or the Uso. There *is* a R. Rubicon (It. Rubico) a few m. N. of Rimini and S. of Cervia.

Rubtsovsk, *t.*, W. Siberia, R.S.F.S.R.; agr. engin.; p. (1959) *111,000.*

Ruby Mines, *dist.*, Mandalay, Upper Burma; hilly region of the Shan plateau, rich in precious stones; H.Q. t. Mogôk, in ctr. of the mining dist.

Ruda Slaska, *t.*, Katowice, Poland; industl; p. (1965) inc. Nowy Bytom *141,000.*

Rudnyy, *t.*, Kazakh S.S.R.; new town 30 m. S.W. of Kustanay; iron ore mining and dressing plant supplying Magnitogorsk; p. (1958) *c. 40,000*

Rudolf, L., N.W. Kenya, in Great Rift Valley; a. 3,500 sq. m.

Rudolph I., N. of Franz Josef Land, Arctic Ocean; Russian naval base; met. sta.

Rudolstadt, *t.*, Gera, E. Germany; on R. Saale; cas.; porcelain, metals; p. (1963) *28,474.*

Rueil Malmaison, *t.*, Seine-et-Oise, France; nr. Paris; p. (1962) *56,024.*

Rufiji, *R.*, Tanzania; E. Africa; flows to the Indian Ocean; length 450 m.

Rugby, *mkt. t.*, *mun. bor.*, Warwick, Eng.; on R. Avon, 11 m. E. of Coventry; famous Public school; elec. and gen. engin., motor and aircraft patterns; p. (1961) *51,651.*

Rugeley, *mkt. t.*, *urb. dist.*, Staffs, Eng.; on R. Trent, 9 m. S.E. of Stafford; coal, iron, tanning; p. (1961) *13,012.*

Ruhr, *industl. dist.*, W. Germany; lies to E. of R. Rhine, on either side of R. Ruhr; rich coalfield; impt. iron and steel, heavy engin. inds. based on local coal and iron ore from Luxembourg, Spain, Sweden; water communications to N. Sea along R. Rhine and Dortmund–Ems Canal; ch. ts. Essen, Duisburg, Düsseldorf, Dortmund, Bochum.

Ruislip-Northwood, *former urb. dist.*, Middlesex, Eng.; now inc. in Hillingdon bor. Greater London (*q.v.*); residtl.; p. (1961) *72,791.*

Rukwa, *L.*, E. Africa; between L. Tanganyika and L. Malawi in the rift valley; 30 m. by 12 m., a. increasing.

Rum, *I.*, Inner Hebrides, Argyll, Scot.; 8½ m. by 8 m.

Rumaila, Iraq; oilfield; pipe-line links to the Zubair–Fao system.

Rumania, *see* **Romania.**
Rum Jungle, N. Terr., Australia; 70 m. S.E. of Darwin; copper deposits.
Runcorn, *industl. t., urb. dist.*, Cheshire, Eng.; on S. side of Mersey estuary; new Runcorn–Widnes bridge over Mersey and Manchester Ship canal opened 1961 (lgst. span arch in Europe); designated "New Town" 1964; p. (estd. 1965) *28,500.*
Rupert, *R.*, Canada; flows from L. Mistassini to James Bay; length 300 m.
Ruse, *t.*, Bulgaria; on R. Danube, opp. Giurgiu in Romania; univ., arsenal, barracks; beer, sugar, tobacco; p. (1956) *53,523.*
Rushden, *t., urb. dist.*, Northants, Eng.; 3 m. E. of Wellingborough; shoes; p. (1961) *17,370.*
Rusholme, *t.*, E. of Manchester, S.E. Lancs, Eng.; industl. and residtl.
Russell *t.*, Kan., U.S.A.; mkt. in agr. and cattle region, oil and gas fields; p. (1960) *6,113.*
Rüsselsheim, *t.*, Hessen, Germany; on R. Main, E. of Mainz; car mftg. (Opel); p. (1963) *44,100.*
Russian Soviet Federal Socialist Republic (R.S.F.S.R.) *ch. constituent rep.*, U.S.S.R.; ch. inds.: wheat, rye, oats, barley, potatoes, sugar-beet, fruits, sunflower, cotton, hemp, tobacco; sheep, cattle, dairying, pigs, horses; lumbering, timber, wood-pulp; coal, petroleum, iron, manganese, etc.; machin., textiles, oil-refining, cement, bricks; a. 6,310,594 sq. m.; cap. Moscow; p. (1959) *117,494,000.*
Rustavi, *t.*, Georgian S.S.R., new *t.* 20 m. S.E. Tbilisi; metallurgical plant; p. (1959) *62,000.*
Rustenburg, *t.*, Transvaal, Rep. of S. Africa; on N.W. edge of High Veld, 60 m. W. of Pretoria; local mkt. for agr. produce, sorghum, maize, cotton; p. (1960) *20,866* (inc. *10,648* whites).
Rutbah, *t.*, Iraq; on oil pipe-line from Iraq to Haifa.
Rute, *t.*, Cordova, Spain; nr. Lucerna; industl.; p. *18,903.*
Ruthenia, *dist.*, U.S.S.R.; formerly part of Romania, ceded to U.S.S.R. in 1945, now part of Ukrainian S.S.R.
Rutherford, *t.*, N.J., U.S.A.; p. (1960) *20,473.*
Rutherfordton, *t.*, N.C., U.S.A.; gold, lumber, textiles; agr.; p. (1950) *3,146.*
Rutherglen, *burgh*, Lanark, Scot.; on R. Clyde, S.E. of Glasgow; industl., chemicals, tubes, paper, wire ropes, bolts, chenilles, webbing; p. (1961) *25,067.*
Ruthin, *t., mun. bor.*, Denbigh, Wales; Vale of Clwyd, 8 m. S.E. of Denbigh; p. (1961) *3,502.*
Rutigliano, *t.*, Bari, Italy; agr.; p. *10,650.*
Rutland, *midland co.*, Eng.; smallest in cty.; agr. farming, livestock; cheese, stone, iron; a. 152 sq. m.; cap. Oakham; p. (1961) *23,956.*
Rutland, *c.*, Vt., U.S.A.; marble quarries, machin. and furniture; p. (1960) *18,353.* [p. *25,225.*
Ruvo, *t.*, Bari, Italy; cath.; olive-oil presses;
Ruwenzori, *Mt.*, on bdy. between Uganda and Congo, Central Africa; overlooks W. arm of Gr. African Rift Valley midway between L. Albert and L. Edward; lower slopes covered in equatorial rain forest, coffee plantations on middle slopes above 5,000 ft.; alt. 16,790 ft.
Rwanda, *indep. rep.*, (1 July 1962), formerly kingdom of Ruanda, part of U.N. trust terr. of Ruanda-Urundi under Belgian adm.; coffee; cap. Kigali; a. 10,169 sq. m.; p. (estd. 1962) *2,634,000.* [m. by 2 m.
Ryan Loch, *arm of sea*, on cst. Wigtown, Scot.; 8
Ryazan, *t.*, R.S.F.S.R.; S.E. of Moscow; distilling, leather, engin.; p. (1962) *252,000.*
Rybinsk, *t., R. pt.*, R.S.F.S.R.; on R. Volga; engin. textiles, hydro-elec.; p. (1959) *181,000.*
Rybinsk Sea (Rybinsk Reservoir), R.S.F.S.R.; artificial L.; created behind dams on R. Volga and R. Sheksna at Rybinsk; part of scheme to regulate flow of R. Volga and to incorporate it in a vast inland waterway system; opened 1945; approx. a. 1,500 sq. m.
Rybnik, *t.*, S.W. Poland; engin., brewing, furniture-mkg.; p. (1965) *38,000.*
Rydal Water, *L.*, nr. Ambleside, Westmorland, Eng.; vil. adjacent contains Rydal Mount, where Wordsworth lived.
Ryde, *t., mun. bor.*, I. of Wight, Eng.; on N.E. cst.; yachting ctr. and seaside resort; boat and yacht bldg.; steamer connection across Spithead to Portsmouth; p. (1961) *19,796.*
Rye, *t., mun. bor.*, *Cinque Pt.*, E. Sussex, Eng.; at mouth of R. Rother to W. of Dungeness; shipbldg. and fishing; p. (1961) *4,429.*
Ryton, *t., urb. dist.*, Durham, Eng.; on R. Tyne W. of Newcastle; ironwks.; p. (1961) *13,485.*
Ryuku Archipelago, *chain of Is.*, 650 m. long, between Taiwan and Kyushi I., Japan; total a. 1,803 sq. m.; incl. Amami-gunto, Okinawa and Sakishima; ch. t. Naha on Okinawa.; mtnous., volcanic; sugar, pineapple, tobacco; steel bars, chemical adhesives; under U.S. control since end of war; self-gov. since 1962; p. (1956) *807,400.*
Rzeszow, *prov.*, S.E. Poland; a. 7,110 sq. m.; agr.; p. (1965) *1,693,000.*
Rzeszow, *t.*, S.E. Poland; industl. development since 1950; p. (1965) *69,000.*
Rzhev, *t.*, R.S.F.S.R.; on R. Volga; industl. and comm. engin.; p. (1956) *42,000.*

Saale, *R.*, Halle and Gera, Germany; trib. of R. Elbe; length 225 m.
Saalfeld, *t.*, Gera, E. Germany; on R. Saale; famous cas. and grottos; machin., chocolate mftg.; p. (1963) *29,635.*
Saane, *R.*, Switzerland; flows to R. Aar, nr. Berne; length 65 m.
Saar, *R.*, Lorraine, Saarland, Palatinate; rises in the Vosges and flows N.W. to R. Moselle, nr. Trier; length 153 m.
Saar, *st.*, W. Europe; in valley of Saar; administered by League of Nations 1919–35 and returned to Germany after plebiscite; economic attachment of Saar to France agreed upon by Allied powers after Second World War; reunited politically with German Federal Republic 1 Jan. 1957 as a *Land.* Impt. coalfields, iron; ch. t. Saarbrucken; p. (1961) *1,072,000.*
Saarbrücken, *cap.*, Saarland, on R. Saar, opposite sister t. of Sanct, Johann; cas.; rich coalfield; iron and steel wks., textiles, leather, paper; p. (1963) *133,100.*
Saarebourg, *t.*, Moselle, France; on R. Saar, 30 m. N.W. of Strasbourg; mnfs. gloves, watch springs; p. (1954) *10,439.*
Saare Maa (Ösel), *I.*, Baltic Sea; at entrance to G. of Riga, Estonian S.S.R., U.S.S.R.; consists of low plateau, bleak and barren; ch. t., Kuresaare; a. approx. 900 sq. m.
Saarlouis, *t.*, Saarland, Germany; on R. Saar; coal-mng., wood, metals; p. (1963) *36,800.*
Saba, *I.*, Neth., Antilles, W. Indies; a. 4 sq. m.; p. (1948) *1,150.*
Sabac, *t.*, Jugoslavia; on R. Sava; old cas.; fruit, cattle, pigs, coal, zinc; p. (1959) *22,000.*
Sabadell, *t.*, Spain; N.W. of Barcelona; linen and cloth mills, flour, paper, distilling, iron founding; p. (1959) *86,417.*
Sabah, East Malaysia, *formerly* N. Borneo; tropical climate but equable, heavy rainfall; largely forested; hardwoods, rubber, tobacco, copra, cutch, hemp; cap. Jesselton; a. 29,387 sq. m.; p. (estd. 1963) *518,000.*
Sabang, *spt.*, Sumatra, Indonesia; bunkering sta.; p. *6,855.*
Sabara, *t.*, Minas Gerais, Brazil; iron and steel; p. (1960) *16,800.*
Sabine, *R.*, Texas and La., U.S.A.; flows through S. Lake (an expansion of the R. 18 m. long) to Gulf of Mexico; length 500 m.
Sable Cape, *S. point*, Fla., U.S.A.
Sable I., off S.E. cst., Nova Scotia; 45 m. long.
Saco, *c.*, Me., U.S.A.; cotton mnfs.; p. (1960) *10,515.*
Saco, *R.*, U.S.A.; flows from White Mtns. in New Hampshire to Saco B., Mne.; 160 m. long.
Sacramento, *c., cap.*, Cal., U.S.A.; on the R. Sacramento; Capitol and R.C. cath.; rail wkshps., smelting, meat and fruit packing, flour, lumber, metal prods., rocket and missiles ind.; p. (1960) *191,667.*
Sadani, *spt.*, Tanzania, E. Africa; at mouth of R. Wami; p. *2,000.*
Saddleback (Blencathara), *mtn.*, Cumberland, Eng.; nr. Keswick; alt. 2,847 ft.
Saddleworth, *t., urb. dist.*, W.R. Yorks, Eng.; in Pennines, 5 m. N.E. of Oldham; woollen, paper mkg., engin.; p. (1961) *17,010.*
Sado, *I.*, off cst. of Honshu, Japan; gold and silver mines; rice, fishing; a. 331 sq. m.
Sadon, *t.*, R.S.F.S.R.; zinc, lead, lead smelting.
Safad, *t.*, N. of Sea of Galilee, Israel; p. *11,800.*

Saffron Walden, *mkt. t., mun. bor.*, Essex, Eng.; on E. Anglian Heights 12 m. N. of Bishops Stortford; agr., hort. and engin.; p. (1961) *7,817*.
Safi, *spt.*, W. cst. Morocco; resort; poor harbour, gr. grain and wool tr.; lge. phosphate plant; fishing; p. (1960) *81,072*.
Saga, *t.*, Kyushu, Japan; coal-mining, fishing: p. (1955) *126,422*.
Sagaing, *div.*, Upper Burma; mtn. ridges, fertile plains; rice, wheat, peas, cotton; a. 50,086 sq. m.; p. *2,322,675*.
Sagaing, *t.*, Upper Burma; on R. Irrawaddy; pagodas; groundnuts, cotton, millets, tobacco, cattle; textile mill projected; p. *c. 15,000*.
Sagan, *see* Zagan.
Saganoseki, *sm. t.*, N.E. Kyushu, Japan; on Bungo Strait, 15 m. E. of Oita; impt. gold-, copper-, silver-mines. [*104,676*.
Sagar, *t.*, Madhya Pradesh, India; univ.; p. (1961)
Sagastyr, *I.*, at mouth of R. Lena, R.S.F.S.R.
Saginaw, *c.*, Mich., U.S.A.; on R. Saginaw; in agr. and timber region; machin., railwks., beet-sugar; p. (1960) *98,265*.
Sagua la Grande, *t.*, Cuba; on R. of same name; machin., chemicals, bricks, tiles, salt; p. (1953) *26,187*.
Saguenay, *R.*, Quebec, Canada; length from L. St. John to St. Lawrence R. about 100 m.; of gr. depth, beautiful scenery; hydro-elec. power developed.
Sagunto, *t.*, Spain; nr. Valencia; p. (1957) *26,932*.
Sahara, the gr. N. African desert between the Sudan and the Barbary sts., extending from the Atlantic to the Nile, inc. Tripoli and Fezzan; a. 3,500,000 sq. m.; the E. portion is known as the Libyan desert, that part E. of the R. Nile, being often called the Nubian Desert; numerous oases with ts. and tr. ctrs.; oil pipe lines to Algerian and Tunisian csts.; p. (estd. *2,500,000*), nomadic Arab and Berber tribes.
Saharan Atlas, S. range of Atlas mtns. in Algeria; ch. pks., J. Aures, 7,644 ft., J. Aissa, 7,350 ft., J. Ksel, 6,594 ft.
Saharan Oases, *terr.*, S. Algeria; p. *39,575*.
Saharanpur, *c.*, Uttar Pradesh, India; rly. wks., wood carving; furniture, paper, tobacco, mnfs.; p. (1961) *185,213*. [(1961) *31,409*.
Sahibganj, *t.*, Bihar, India; on R. Ganges; p.
Saida, *see* Sidon.
Saidabad or Sirdjan, *t.*, Laristan, Iran; S.W. of Kerman, nr. Kuh-i-Lalehzar mtn.; p. *10,000*.
Saigon, *c.*, *spt.*, S. Viet-Nam; on R. Saigon, to E. of Mekong delta, 60 m. from sea; lge. comm. ctr.; cath., citadel, arsenal and naval yd.; spices, rice; paper mill; p. (1958) *1,799,175* (with Cholon). [outlet into L. Ladoga.
Saimaa, *L.*, Finland; N. of Viborg; a. 150 sq. m.;
St. Abb's Head, *rocky promontory*, Berwick, Scot.
St. Agnes Head, Cornwall, Eng.
St. Albans, *c.*, *mun. bor.*, Herts, Eng.; on N. margin of Vale of St. Albans, 20 m. N.W. of London; faces remains of Roman Verulamium across R. Ver; light inds., electronics, instrument mkg.; cath.; residtl.; p. (1961) *50,293*.
St. Albans, *t.*, Vt., U.S.A.; dairy farming; p. (1960) *8,806*. [industl.; p. (1954) *10,765*.
St. Amand, *t.*, Cher., France; on R. Cher;
St. Andrews, *burgh*, Fife, Scot.; on N.E. cst. of Fife; seaside resort; univ.; famous golf course; p. (1961) *9,888*.
St. Anne, *t.*, Alderney, Channel Is.; church designed by Sir George Gilbert Scott.
St. Anthony, *waterfalls*, on R. Mississippi; U.S.A. predominant factor in site of Minneapolis (Minn.).
St. Arnaud, *t.*, Victoria, Australia; p. *2,900*.
St. Asaph, *c.*, *rural dist.*, Flint, N. Wales; on R. Clwyd, 4 m. N. of Denbigh; cath.; optical glass mkg.; p. (rural dist. 1961) *9,478*.
St. Augustine, *t.*, Fla., U.S.A.; resort; p. (1960) *14,734*.
St. Austell, *mkt. t.*, *urb. dist.*, Cornwall, Eng.; on S. flank of Hensbarrow, 14 m. N.E. of Truro; holiday resort; china clay, stone engin., wood and cork; p. (1961) *25,*
St. Barthélemy, *French I.*, W. Indies; d
e; p. (1960) *2,079*.
St. Bees Head, *promontory*, 2½ m. N.W. of St. Bees, Cumberland, Eng.; freestone quarries, *hm.*
St. Benoit, *t.*, Ile de la Réunion, Indian Ocean; connected by rail with ch. port, Pointe-des-

St. Bernard Pass, Great, on Italian–Swiss bdy., W. Alps; carries main road from W. Switzerland to Plain of Lombardy; approached from N. by trib. of upper Rhône, from S. by Val d'Aosta; 8,120 ft. above sea level. The Great St. Bernard road tunnel (3½ m.) constr. 1958–62 links Cantine de Proz (Valais can., Switzerland) and St. Rhémy (Italy); under tunnel will run projected 260 m. pipeline from Genoa to Aigle.
St. Bernard Pass, Little, on French–Italian bdy., W. Alps.; links Isère valley with Val d'Aosta; alt. approx. 5,000 ft.
St. Boniface, *t.*, Manitoba, Canada; sub. of Winnipeg; p. (1961) *37,600*.
St. Bride's Bay, Pembroke, Wales.
St. Brieuc, *t.*, Côtes-du-Nord, France; college, cath.; ironwks., textiles, timber and cst. tr.; p. (1962) *47,307*.
St. Buryan, *par.*, Cornwall, Eng.; lobster and crab fishing; p. *1,132*.
St. Catharines, *c.*, Ont., Canada; on Welland Canal; mkt. for Niagara fruit-growing reg.; agr. implement wks., timber mills, flour mills, tanneries and varied inds.; (1961) *48,472*.
St. Chamond, *t.*, Loire, France; nr. St. Etienne; silk, ribbons, rayon; rly. wks.; coal-mining; p. (1954) *15,580*.
St. Charles, *c.*, Mo., U.S.A.; nr. St. Louis; tobacco and flour; p. (1960) *21,189*.
St. Clair, *L.*, Canada–U.S.A.; part of link between L. Huron and L. Erie.
St. Clair, *R.*, N. America; flows from L. Huron through L. of St. Clair into L. Erie; forms bdy. between Michigan (U.S.A.) and Ontario (Canada); impt. link in Gr. Lakes waterway; length 85 m., depth dredged to 20 ft.
St. Clair Shores, *t.*, Mich., U.S.A.; residtl. sub. of Detroit; p. (1960) *76,657*.
St. Claude, *t.*, Jura, France; at confluence of Rs. Tacon and Bienne; cath.; fancy shell, horn and ivory mnfs.; p. (1954) *11,301*.
St. Cloud, *t.*, Seine-et-Oise, France; 6 m. from ctr. of Paris; fine park, château; residtl.; porcelain; p. (1954) *20,671*.
St. Cloud, *t.*, Minn., U.S.A.; on R. Mississippi; timber yds., dairying, farming; p. (1960) *33,815*.
St. Croix, *I.*, Virgin Is., gr., U.S.A.; ch. inds. sugar cultivation, stock raising, vegetable growing, rum mnf.; a. 82 sq. m.; p. (1950) *12,096*.
St. Croix, *R.*, Wis., U.S.A.; trib. of the Mississippi; length 200 m.
St. Davids, *c.*, Pembroke, Wales; 15 m. S.W. of Fishguard; cath., ruins of Bishop's Palace; p. *1,595*.
St. Davids Head, *prom.*, on cst. of Pembroke, Wales.
St. Denis, *t.*, *N. sub.*, Paris, France; industl. and residtl.; abbey, burial pl. of Kings of France; chemicals, machin., spirits, soap; p. (1962) *95,072*.
St. Denis, *spt.*, *cap.*, Ile de la Réunion (French), Indian Ocean; p. (estd. 1965) *65,000*.
St. Dié, *t.*, Vosges, France; on R. Meurthe; cath.; iron, copper, machin., hosiery; p. (1954) *20,952*.
St. Dizier, *t.*, Haute-Marne, France; on R. Marne; iron, steel, copper, boats; p. (1954) *25,515*.
St. Elias, *mtn.*, Alaska, U.S.A.; alt. 18,024 ft.
St. Etienne, *t.*, *cap.*, Loire, France; nr. Lyons; ribbon-weaving, boot-lace, silk, velvet, engin., armaments, motor-cycles, cycles, chemicals, and iron mftg. ctr., in coal-field dist.; p. (1962) *203,633*.
St. Eustatius, one of the Neth. Antilles, W. Indies; a. 31 sq. m.; p. (1963) *1,103*.
St. Francis R., Quebec, Canada; hydro-elec. power.
St. Francis, *R.*, Mo., U.S.A.; trib. of R. Mississippi; forms bdy. of Ark.; length 450 m.
St. Gall (St. Gallen), *can.*, Switzerland; mountainous; forest; vineyards; cattle raising; cotton spinning, lace; cap. St. G.; a. 777 sq. m.; p. (1961) *339,489*.
St. Gall, *t.*, Switzerland; on R. Steinach; cath.; cottons and embroidery; p. (1961) *76,700*.
St. George, *bay*, W. cst. Newfoundland, Canada.
St. George, *I.*, Grenada Is., Brit. W. Indies; wireless sta.
St. George, *spt.*, N.B., Canada; various granites quarried; p. *1,169*.
St. George's Channel, Brit. Isles; part of Irish Sea separating Wales from Ireland.
St. George's I., Fla., U.S.A.
St. Germain, *t.* Seine-et-Oise, France; on R.

Seine; former royal château; cottons, woollens; p. (1954) *29,429*.

St. Germans, *mkt. t., rural dist.,* Cornwall, Eng.; 4 m. W. of Saltash; p. (rural dist. 1961) *14,775*.

Saint Gotthard, *mtn. gr.,* Alps, S. central Switzerland, crossed by St. Gotthard Pass (6,935 ft.). St. Gotthard Rly. passes through St. Gotthard tunnel (9¼ m., max. alt. 3,786 ft.). Road tunnel (6¼ m.) under pass Göschenen to Airolo projected; motorways linking pass with Zurich, Basle and Lugano being built.

St. Gowan's Head, *promontory,* Pembroke, Wales.

St. Helena, *I., Brit. col.,* Atl. Oc.; 1,200 m. from W. cst. Africa; spt. and only t. Jamestown; Napoleon imprisoned 1815–21, and Boer captives 1900; famous for its wirebird, species of plover peculiar to I.; a. 47 sq. m.; p. (estd. 1965) *4,526*.

St. Helens, *t., co. bor.,* Lancs, Eng.; 12 m. E. of Liverpool; connected by canal with R. Mersey; coal, iron, alkali; copper smelting, glass, fibreglass, plastics; p. (1961) *108,348*.

St. Helier, *spt.,* Jersey, Channel Is.; p. *26,484*.

St. Hyacinthe, *c., spt.,* Quebec, Canada; on Yamaska R.; cath.; farm machin., woollens, leather; p. (1961) *22,354*.

St. Ives, *t., mun. bor.,* Cornwall, Eng.; at entrance to St. Ives Bay; fishing, holiday resort; p. (1961) *9,337*.

St. Ives, *mkt. t., mun. bor.,* Huntingdon, Eng.; on R. Ouse, 4 m. E. of Huntingdon; timber, gravel, concrete prod., engin., canning, agr. machin.; p. (1961) *4,076*.

St. James, *t.,* Man., Canada; p. (1961) *33,977*.

St. Jean, *t.,* Quebec, Canada; rly. junction; porcelain, pottery, tiles; p. (1961) *26,988*.

St. Jérôme, *t.,* Quebec, Canada; pulp, paper, knitted goods, woollens, rubber goods, cement, bricks; p. (1961) *24,546*.

St. John, *c., spt.,* N.B., Canada; cottons, woollens, machin., paper, lumbering, sugar refinery; fisheries; corn tr.; p. (1961) *95,563*.

St. John, *I.,* U.S Virgin Is. gr.; a. 19 sq. m.; ch. inds. charcoal, stock-raising, tourists; was noted for bay leaf oil, but ind. now dormant.

St. John, *L.,* Quebec, Canada; on Saguenay R.

St. John, *R.,* N.B., Canada; flows to Bay of Fundy; length 450 m.

St. John, *t., cap.,* Antigua, W. Indies; p. (1957) *12,000*.

St. John's Point, *C.,* Down, Northern Ireland; forming N. side of Dundrum Bay.

St. Johns R., Fla., U.S.A.; flows to Atlantic; length 350 m.

St. John's, *spt., c., cap.,* Newfoundland, Canada; on E. cst.; first Eng. settlement in America; univ.; gr. tr. in fish, cod, oil, etc.; p. (1961) *90,838*.

Sciacca, *spt.*, Sicily, Italy; nr. Agrigento; cath.; H.Q. of Mediterranean coral fishery; sardines, olives; mineral springs; p. approx. *25,000*.
Scilla, *promontory*, Strait of Messina, Calabria, Italy.
Scilly Is., *gr.*, 30 m. S.W. of Land's End, Cornwall, Eng.; total a. 10 sq. m.; lgst. I., St. Marys; cap. Hugh Town; flowers, vegetables; p. (1961) *2,273*.
Scioto, *R.*, Ohio, U.S.A.; joins Ohio at Portsmouth; length 250 m.
Scone, *par.*, Perth, Scot.; place of residence and coronation of early Scottish kings; from here Edward I. removed the Stone of Destiny to Westminster Abbey in 1297; tourist ctr.; civil aerodrome.
Scotland, Brit. Is.; N. part of Gr. Britain; contains 33 cos.; home affairs administered by Dep. of Secretary of State for Scot.; physically divided into Highlands (many islands on W.), Middle Lowlands and S. Uplands; highest peaks, Ben Nevis 4,406 ft. and Ben Macdhui 4,296 ft.; ch. Ls., L. Lomond, L. Ness; ch. Rs., Clyde, Tweed, Tay, Spey, Dee, Forth; climate, maritime; agr. in E., grazing in W.; oats, barley, wheat, potatoes, fruit; coal, iron, oil-shale, granite; fisheries; mnfs., textiles, shipbldg.; machin., distilling, sugar-refining, printing; hydroelectric development in Highlands; cap. Edinburgh; Glasgow, ch. comm. and industl. t.; a. 29,796 sq. m.; p. (1961) *5,178,490*.
Scranton, *c.*, Penns., U.S.A.; on R. Susquehanna; anthracite, iron foundries, steel wks., locomotives, and silk mnfs.; p. (1960) *111,443*.
Scunthorpe, *t.*, *mun. bor.*, Lindsey, Lincs, Eng., on Lincoln Edge, 6 m. S. of the Humber; iron-mng. and smelting, steel girders, engin., chemicals, tar distillation, hosiery, lt. inds.; p. (1961) *67,257*.
Scutari (Albania), *see* **Shkodra**.
Scutari (Turkey), *see* **Üsküdar**.
Seaford, *t.*, *urb. dist.*, E. Sussex, Eng.; 3 m. E. of Newhaven; seaside resort; p. (1961) *10,994*.
Seaforth Loch, Lewis, Outer Hebrides, Scot. 14 m. long.
Seaham, *spt.*, *urb. dist.*, Durham, Eng.; Seaham Harbour, on E. cst. 4 m. S. of Sunderland modern colly. workings, extending under sea p. (1961) *26,048*.
Seathwaite, *vil.*, Cumberland, Eng.; 7 m. from Keswick, close to Styhead (1,430 ft.); exceptionally heavy annual rainfall (above 150 in.).
Seaton, *t.*, *urb. dist.*, S. Devon, Eng.; on Lyme Bay at mouth of R. Axe; seaside resort freestone quarries; p. (1961) *3,410*.
Seaton Valley, *t.*, *urb. dist.*, Northumberland, Eng.; nr. Blyth; coal-mining; p. (1961) *26,086*.
Seattle, *spt.*, Wash., U.S.A.; univ. cath.; shipbldg., aeroplanes, glass, fish-canning, fishing, packing, lumbering, chemicals, trucks, buses; p. (1960) *557,087*.
Sebnitz, *t.*, Dresden, E. Germany; p. (1963) *14,520*.
Secunderabad, Andhra Pradesh, India; military [sta.; p. (1961) *78,412*.
Sedalia, *c.*, Mo., U.S.A.; farming, meat-packing; machin., textiles, coal; rly. ctr. and wks.; p. (1960) *23,874*.
Sedan, *t.*, Ardennes, France; on R. Meuse; weaving; machin., metal ware, woollens, flour; battle 1870; p. (1954) *17,637*.
Sedgley, *industl. t.*, *urb. dist.*, Staffs, Eng.; nr. Wolverhampton; coal-mng., metal wks., bricks, engin., fireclay goods; p. (1961) *27,927*.
Segezha, *t.*, R.S.F.S.R.; on L. Vyg; cellulose, paper, sawmilling.
Sego, *L.*, R.S.F.S.R.; 20 by 20 m.; N.W. of L. Onega; outlet into White Sea.
Ségou, *t.*, *R. pt.*, Mali, W. Africa; on R. Niger; ctr. of irrigation scheme; cotton, hides, cattle, wax, salt; p. (1957) *21,000*.
Ségou Canal, W. Africa; leaves R. Niger 4 m. below Bamako, extends 130 m. N.E. to Ségou; irrigates 3,000 sq. m. on right bank of Niger and assists navigation.
Segovia, *prov.*, Old Castile, Spain; agr., stock-keeping, and mftg.; cap. Segovia; a. 2,682 sq. m.; p. (1959) *204,484*.
Segovia, *c.*, Spain; nr. R. Eresma; cath.; iron-ware, cloth, earthenware, paper, flour; p. (1957) *34,700*.
Segre, *R.*, Lérida, N.E. Spain; rises in E. Pyrenees, flows S.W. into R. Ebro; water irrigates the a. around Lerida, the lgst. block of irrigated land in Spain; length approx. 170 m.
Segura, *R.*, Spain, flows to Mediterranean at Guardamar; 180 m.
Seikan Tunnel, project to link main Japanese I. of Honshu with northern I. of Hokkaido under Tsugaru Straits; length 23 m. (14 m. under sea-bed); expected completion 1970.
Seim, *R.*, Ukrainian S.S.R.; trib. of R. Desna; length 300 m.
Seine, *R.*, France; rising in Côte d'Or dep., and flowing past Paris and Rouen to English Channel at Havre; length 473 m.
Seine-et-Marne, *dep.*, N. France; agr., stock-raising, dairying; "Brie" cheese; porcelain, gypsum, flagstone; cap. Melun; a. 2,275 sq. m.; p. (1962) *537,543*.
Seine-Maritime, *dep.*, N. France; undulating and fertile; grain, dairying, textiles, iron, shipbldg., flax, chemicals; fisheries; cap. Rouen; a. 2,448 sq. m.; p. (1962) *1,035,844*.
Seine-Saint-Denis, *dep.*, N.E. Paris, France; mkt. gardens; p. (1964) *1,083,700*.
Seistan and Baluchistan, *twin prov.*, Iran; co. ts. Zabol, Zahedan (rly. term. Pakistan rly. from Quetta through Mirjaveh, the customs post, on Iranian frontier).
Sekondi, *spt.*, Ghana, W. Africa; connected with and largely superseded as a pt. by Takoradi harbour; p. (1948) *44,130* (inc. Takoradi).
Selangor, *st.*, W. Malaysia; central Malaya; cap. Kuala Lumpur (to relieve congestion, Klang designated future cap.); chemicals; a. 3,150 sq. m.; p. (1961) *1,180,413*.
Selby, *mkt. and industl. t.*, *urb. dist.*, W.R. Yorks, Eng.; on R. Ouse, 13 m. S. of York; ancient abbey church; flour-milling, flax, oil-cake; p. (1961) *9,869*.
Sele, *R.*, S. Italy; rises in S. Apennines, flows W. into G. of Salerno; headwaters now carried E. through gr. Apennine tunnel (7 m.) to irrigate plateau of Apulia in S.E. Italy.
Selenga, *R.*, Mongolia and Siberia; flows into L. Baikal; length 750 m.
Sélestat, *t.*, Bas-Rhin, France; on R. Ill; two caths.; p. (1954) *11,705*.
Selkirk, *co.*, Scot.; mountainous (Broad Law 2,723 ft.); sheep, oats, woollens; cap. Selkirk; a. 267 sq. m.; p. (1961) *21,055*.
Selkirk, *bor.*, *co. t.*, Selkirk, Scot.; on Ettrick Water; 4 m. S. of Galashiels; tartans, tweeds; p. (1961) *5,634*.
Selkirk, *t.*, Yukon, Canada; on junction of Macmillan and Lewes Rs.
Selkirk Mtns., B.C., Canada; run N.W. to S.E. parallel with Rocky Mtns. and occupy inside of the great bend of R. Columbia; ancient rocks,

highly mineralised; pierced by Connaught Tunnel on Canadian Pacific Rly. route through Kicking Horse Pass to Vancouver; rise to over 9,000 ft.

Selma, *c.*, Ala., U.S.A.; on Alabama R.; in cotton-growing dist.; also dairying, lumbering, ironwks., fertilisers; p. (1960) *28,385*.

Selsey, *t.*, Sussex, Eng.; on Selsey Bill, 7 m. S. of Chichester; coastal resort; fishing.

Selsey Bill, *peninsula*, between Bognor Regis and Portsmouth, Sussex, Eng.

Selukwe, *t.*, Rhodesia; alt. 4,734 ft.; goldmng., chrome ore, molybdenum; ranching, agr.

Selwyn Range, *mtns.*, Queensland, Australia; extends 350 m. W. from Gr. Dividing Range; forms divide between Rs. flowing N. to G. of Carpentaria and Rs. flowing S. to Darling; gold, copper; alt. mainly below 1,500 ft.

Semarang, *spt.*, Java, Indonesia; exp. sugar, tobacco, tapioca, kapok; shipbldg., rly. repairs, cement, sawmills; p. (1961) *503,000*.

Seminole, *t.*, Okla., U.S.A.; p. (1960) *11,464*.

Semipalatinsk, *t.*, Kazakh. S.S.R.; on R. Irtysh; lge meat-packing plant; textiles, sawmilling, engin.; rich gold deposit found in a. 1965; p. (1959) *155,000*.

Semlin, *see* Zemun.

Semmering Pass, *low pass*, Austria; provides route across E. Alps for rly. from Vienna to Venice; alt. below 3,000 ft.

Semnan, *dist.*, N. Iran; much desert land; cap. Semnan; p. (1967) *59,152*.

Sena, *t.*, Mozambique; on R. Zambesi.

Sendai, *t.*, Honshu, Japan; salt, fish; p. (1964) *480,000*.

Senegal, *R.*, W. Africa; flowing from Kong mtns. W. and N.W. to Atlantic at St. Louis, above Cape Verde; length 1,000 m.

Senegal, *indep. sovereign st.*, within Fr. Community; N. of R. Gambia; groundnuts; chromium 375 m. E. of D.; cap. Dakar; a. 78,000 sq. m.; p. (estd. 1965) *3,400,000*.

Senekal, *t.*, O.F.S., S. Africa; tr. ctr.; wool, wheat; p. (1960) *7,409* (inc. *1,984* whites).

Senigallia, *t.*, Italy, N.W. of Ancona; p. *26,345*.

Sennar, *t.*, Sudan; on Blue Nile, on rly. route to Khartoum, Suakin, Pt. Sudan; dam for irrigation and control of Nile floods; hydro elec. power sta.; p. *1,000*.

Sennin, *see* Kamaishi.

Sens, *t.*, Yonne, France; on R. Yonne; cath., the ancient Agedincum; farm implements, boots, chemicals, cutlery; p. (1954) *18,612*.

Sensuntepeque, *t.*, E. Salvador, Central America; pottery, distilling; p. (1960) *27,070*.

Senta, *t.*, Jugoslavia; on R. Tisa; flour, leather, sugar, wine, agr., machin., chemicals, paper; p. (1959) *20,000*.

Seoul, *cap.*, S. Korea; brassware, pottery, silk; processing clinker into cement; p. (1963) *3,376,000*. [alt. 7,611 ft.

Septimer, *mtn. pass*, Swiss Alps, can. Grisons;

Seraing, *t.*, Liége, Belgium; extensive ironwks.; engin.; p. (1962) *40,706*.

Serampore, *t.*, W. Bengal, India; former Danish settlement; cotton and silk weaving, pottery, jute- and paper-mills; p. (1961) *91,521*.

Serang, *I.*, Indonesia, N. of Amboina; a. 6,612 sq. m.; tobacco; p. (estd.) *105,000*.

Serbia, *fed. unit*, Jugoslavia; former independent kingdom; a. 33,930 sq. m.; cap. Belgrade; p. (1960) *7,593,000*. [25,000.

Seremban, *t.*, cap., Negri Sembilan, Malaya; p.

Seres, *see* Sérrai. [290 m.

Sereth, *R.*, Romania; trib. of R. Danube; length

Sergipe, *cst. st.*, Brazil; forested; tobacco, maize, sugar, cotton; oil deposits; cap. Aracaju; a. 8,129 sq. m.; p. (1960) *760,273*.

Sergo, *see* Kadiyevka.

Seria, *t.*, Brunei; oil ctr.; linked by pipe-line with Lutong. [Ægean Sea.

Sériphos, *I.*, Cyclades gr., Grecian Archipelago,

Serov, *t.*, R.S.F.S.R., in Urals; iron and steel; natural gas pipeline from Ingrim; p. (1959) *98,000*. [34,000.

Serowe, *c.*, Botswana, S.W. Africa; p. (1964)

Serpukhov, *t.*, *R. pt.*, R.S.F.S.R.; on R. Oka, S. of Moscow; engin., textiles; p. (1959) *105,000*.

Serra da Mantiqueira, *mtn. range*, highest in Brazil;

Serra do Espinhaco, *mtns.*, Brazil; highest peak, Itambe, 6,705 ft.; iron-ore deposits.

Serra do Mar, *mtns.*, Brazil; form steep E. edge of Brazilian Plateau S. from Rio de Janeiro.

Sérrai (Seres), *prefecture* Macedonia, Greece; cap. Sérrai; p. (1961) *248,045*.

Sérrai (Seres), *t.*, Macedonia, Greece; on Struma R.; woollens, cottons, carpets; p. (1961) *40,063*.

Sesto San Giovanni, *sub.*, Milan, Italy; machin., glass, chemicals, plastics; p. (1961) *71,384*.

Sète (formerly Cette), *spt.*, Hérault, France; on Mediterranean cst.; chemicals, fisheries; exp. oysters, brandy, wine; oil pipeline under the sea to Frontignan; p. (1954) *33,454*.

Setif, *mkt. t.*, E. Algeria; alt. 3,596 ft.; cereals, horses; p. (1948) *51,674*.

Setouchi, *coastal region*, S.W. Honshu, N. Shikoku, Japan; flanks shores of Inland Sea; sm. plains backed by terraced hillsides; intensive agr., rice, mulberry, tea, citrus fruits; many sm. ts. engaged in fishing, local tr. and varied inds. inc. textiles, salt-extraction from brine.

Setté Cama, *spt.*, Gaboon, Equat. Africa; open roadstead, landing difficult owing to swell; exp. timber; oil nearby.

Settle, *mkt. t.*, *rural dist.*, W.R. Yorks, Eng.; on R. Ribble in heart of Craven dist.; caves with remains of extinct fauna; thread, cotton; p. (rural dist 1961) *13,782*.

Settsu Plain, S. Honshu, Japan; located at head of Osaka Bay at E. end of Inland Sea; intensively cultivated alluvial lowlands, ch. crops, rice, vegetables, oranges; gr. industl. belt extends along cst. through Kobe, Osaka, Kishiwada; engin., chemicals, textiles; a. 500 sq. m.

Setubal, *c.*, *spt.*, Lisbon, Portugal; on R. Sado; boatbldg., fishing, sardine-curing, lace, salt, fertilizers, etc.; p. (1960) *44,435*.

Seul Lac, *L.*, S. of St. Joseph L., Ont., Canada.

Sevan (Gokcha), *lge. L.*, Armenian S.S.R.; alt. 6,340 ft.; never freezes; surrounded by high, barren mtns.

Sovan, *t.*, Armenian S.S.R.; underground hydro-elec. power sta.

Sevastopol, *spt.*, Ukrainian S.S.R.; built on ruins left after famous siege 1855; Black Sea resort; naval arsenals; leather, tiles, machin.; exp. grain; p. (1959) *148,000*.

Seven Islands, *pt.*, on St. Lawrence, Quebec, Canada; iron brought by rail from Schefferville; airline service but no highway.

Sevenoaks, *mkt. t.*, *rural dist.*, Kent, Eng.; in Vale of Holmesdale, 5 m. N.W. of Tonbridge; residtl; agr., light inds.; Knole Park; p. (1961) *17,604*.

Severn, *R.*, W. of Eng. and N. Wales; rises in Montgomery and flows to Bristol Channel; length 200 m.; suspension bridge at estuary opened 1966.

Severn, *R.*, Ontario, Canada; flows to Hudson Bay; length 350 m.

Severn Tunnel, Eng.; under estuary of R. Severn between Pilning (Glos.) and Severn Tunnel Junction (Mon.); carries main rly. from London to S. Wales; longest main-line rly tunnel in Brit. Is.; length nearly 4½ m.

Severodvinsk, *t.*, R.S.F.S.R.; on Dvina Bay, White Sea; metals, bldg. materials; p. (1959) *79,000*.

Seville, *prov.*, Spain; agr., mining; cap. Seville; a. 5,430 sq. m.; p. (1959) *1,226,730*.

Seville, *pt.*, *cap.*, Seville, Spain; on R. Guadalquivir; Gothic cath.; palace, univ.; ironware, machin., cigars, silks, porcelain, brewery, cotton and wool mills, aircraft; exp. lead, iron, mercury, cork, oranges, lemons, wine; birthplace of Velasquez and Murillo; p. (1959) *424,757*.

Sevran, *t.*, Seine-et-Oise, France; p. (1954) *12,956*.

Sèvres, *t.*, Seine-et-Oise, France; on R. Seine; celebrated porcelain mnfs.; p. (1954) *17,109*.

Sevres (Deux), *dep.*, N. France; p. (1962) *321,118*.

Seychelles Is., *Brit. col.*, Indian Ocean; consisting of 92 Is., lgst. I. Mahé; cap. Victoria; exports prods. of coconut palm, phosphate, essential oils and spices; famous for species of nut; total a. 156 sq. m.; p. (estd. 1965) *46,000*.

Seyne or **La Seyne-sur-Mer**, *t.*, Var, France; nr. Toulon; shipbldg.; p. (1954) *36,672*.

Sfax, *spt.*, Tunisia; admin. ctr.; exp. phosphate, olive oil, salt, esparto grass, cereals, dates, hides; imports food, coal, textiles, soap; sponges; fishing; natural gas found in a. p. (1956) *65,635*. [3,483 ft.

Sgurr Mor, *mtn.*, Ross and Cromarty, Scot.; alt.

Shabani, *t.*, Rhodesia; asbestos; p. (1958) *7,930* (incl. *1,700* Europeans).

Shadrinsk, *t.*, R.S.F.S.R.; W. Siberia, 160 m. S.E. of Sverdlovsk; car parts, printing presses; p. (1959) *52,000*.

Shaftesbury, *mkt. t., mun. bor.*, Dorset, Eng.; 10 m. N. of Blandford; agr. implements, chemicals, glove mftg.; p. (1961) *3,366*.

Singhbhum, *dist.*, Bihar, India; iron- and steel-wks; a. 5,191 sq. m.; p. (1961) *2,049,911*.
Sinhailien (Xinhailion), c., Kiangsu, China; formed by merger of Sinpu, Tunghai and Lienyienkang; p. (1953) *208,000*.
Sining (Xining), *c.*, Tsinghai prov., China; wool, salt, timber; p. (1953) *94,000*.
Sinkiang-Uighur (Xinjiang), *aut. region*, China, bordering on Soviet Union and Kashmir; cereals, cotton, wool, silk; cap. Urumchi; a. 705,962 sq. m.; p. (1953) *4,873,608*.
Sinneh, *t.*, Iran; carpets; p. *32,000*.
Sinop, *Turkish t.*, on Black Sea; timber, silk; p. (1960) *9,899*.
Sinsiang (Xinxiang), *c.*, Honan prov., China; cotton weaving, flour milling; p. (1953) *171,000*.
Sintra (Cintra), *t.*, Portugal; summer resort, 18 m. from Lisbon; convention of S., 1808.
Sion, *cap.*, Valais, Switzerland; on R. Rhône; built on two castled hills; cath.; hydroelec. plant nearby; p. (1957) *10,904*.
Sioux City, Iowa, U.S.A.; on R. Missouri; meat-packing, foundries, elec. goods, cement; p. (1960) *89,159*.
Sioux Falls, *t.*, S.D., U.S.A.; on Big. Sioux R.; in rich wheat region; machin., cars, farming implements; nuclear reactor; p. (1960) *65,466*.
Sir Edward Pellew, *gr. of Is.*, N. Australia; in G. of Carpentaria.
Sistan and Baluchestan, *twin prov.*, Iran; bounded by Afghanistan and Pakistan; cap. Zahedan; much desert land; arid, very hot; p. (1967) *456,435*.
Sitapur, *t.*, Uttar Pradesh, India; p. (1961) *53,884*.
Sitka (formerly Novo Archangelsk), *t.*, S.E. Alaska, U.S.A.; on Baranof I., in Sitka Sound; was ch. pt. of former Russian America; gold-mines; lumbering, canning; naval and coaling sta.; p. (1960) *3,237*.
Sitra, *I.*, Persia G.; forming part of st. of Bahrain, Arabia, 3 m. long and 1 m. wide; oil pipeline and causeway carrying road extends out to sea for 3 m. to deep-water anchorage.
Sittang, *R.*, Burma; rises in Pegu Yoma, flows S., enters G. of Martaban, Andaman Sea through delta; valley intensively cultivated, rice; delta forested; length 610 m.
Sittingbourne and Milton, *mkt. t.*, *urb. dist.*, Kent, Eng.; on Milton Creek, 9 m. E. of Chatham; paper-mills, brick-wks.; cement; insecticides; ctr. of fruit-growing dist.; p. (1961) *23,616*.
Sivas, *prov.*, Turkey; rich in minerals, has mineral springs with fertile grain-growing soil, fine orchards and vineyards, besides timber forests; cap. Sivas; p. (1965) *705,077*.
Sivas, *t.*, Turkey; in the Kizil Irmak valley; mnfs. woollens; p. (1965) *109,165*. [U.S.S.R.
Sivash or **Putrid Sea,** lagoon on E. side of Crimea,
Siwa, *oasis*, Egypt; in Libyan Desert, 300 m. S.W. of Alexandria; dates, olives, remains of temple of Ammon and the fountain of the Sun; 20 m. long, 1 m. wide; p. *1,000*.
Sizewell, Suffolk, Eng.; nuclear power sta.
Sjælland, I., Denmark; lgst. I.; agr., fishing, mnfs.; ch. t. Copenhagen; a. 2,840 sq. m.; p. (1960) *1,771,557*.
Skagen, *t.*, N. Denmark; on cst. of the Skagerrak; fishing, tourism; p. (1960) *10,390*.
Skagerrak, arm of N. Sea, giving access to the Kattegat, between Norway and Denmark, 70–90 m. wide.
Skagway, *sm. spt.*, Alaska, U.S.A.; at head of Lynn Canal inlet, 400 m. N.W. of Prince Rupert; linked by rly. to Whitehorse on Upper R. Yukon; boomed in gold rush (in 1898, p. *15,000*), subsequently declined; p. (1960) *659*.
Skåne (Scania), *peninsula*, extreme S. of Sweden; corresponds approx. to cos. Malmöhus, Kristianstad; most favoured part of Sweden in relief, soil, climate; intensive farming, wheat, barley, sugar-beet, fodder crops, dairy cattle; ch. ts. Malmo, Lund, Hälsingborg; a. approx. 4,000 sq. m. [*250,180*.
Skaraborg, *co.*, Sweden; a. 3,269 sq. m.; p. (1961)
Skarzysko-Kamienna, *t.*, Kielce, Poland; p. (1965) *37,000*.
Skaw, The (Grenen), *C.*, at extreme N. of Denmark.
Skeena, *R.*, B.C., Canada; rises in N. Rocky Mtns., flows S.W. to Pac. Oc. at Prince Rupert; lower valley used by Canadian National Rly. from Edmonton (Alberta) to Prince Rupert via Yellowhead Pass; length approx. 400 m.
Skegness, *t.*, *urb. dist.*, Lindsey, Lincoln, Eng.; on E. cst.; farming, vegetables; resort; light engin.; p. (1961) *12,843*.
Skelleftea, *t.*, N. Sweden; on Bothnia G., mng., chiefly copper, gold.; p. (1961) *22,730*.
Skelmersdale, *t.*, *urb. dist.* Lancs, Eng.; coal, bricks, drainpipes; designated "New Town" 1961; p. (estd. 1965) *8,695*.
Skelton and Brotton, *t.*, *urb. dist.*, N.R. Yorks, Eng.; at N. foot of Cleveland Hills, 10 m. E. of Middlesbrough; steel flooring; p. (1961) *13,186*.
Skerries, *spt.*, Dublin, Ireland; fishing; muslin, stones; p. (1951) *2,457*.
Skibbereen, *mkt.*, *spt.*, *urb. dist.*, Cork, Ireland; farming; p. (1961) *2,015*.

Skiddaw, *mtn.*, Cumberland, Eng.; E. of Bassenthwaite L.; alt. 3,054 ft.
Skien, *spt.*, Bratsberg, Norway; on R. Skien; saw-mills, ice, and timber tr.; p. (1960) *15,502.*
Skierniewice, *t.*, Lodz, Poland; S.W. of Warsaw; p. (1965) *24,000.*
Skipton, *t.*, *urb. dist.*, W.R. Yorks, Eng.; on R. Aire, 6 m. N.W. of Keighley; cotton and rayon; cas.; p. (1961) *12,988.*
Skive, *t.*, N. Jutland, Denmark; fishing; rly. ctr.; p. (1960) *15,558.* [engin.; p. *16,740.*
Skopin, *t.*, R.S.F.S.R.; S.E. of Moscow; lignite,
Skopje, *t.*, *cap.*, Macedonia, Jugoslavia; the ancient Scupi, one of oldest ts. in Balkans; almost completely destroyed by earthquake 26 July 1963 (over 1 000 deaths); chrome mines in neighbourhood; steelplate wks.; p. (1959) *167,000.*
Skövde, *t.*, Sweden; between Ls. Vänern and Vättern; garrison t., cars, cement; p. (1961) [illegible]
Skowhegan, *t.*, Me., U.S.A.; p. (1950) *6,183.*
Skye, *I.*, lgst. of the Inner Hebrides, Inverness, Scot.; mountainous; sheep-farming and fisheries; only town, Portree; a. 547 sq. m.
Skyros, *I.*, Grecian Archipelago, E. of Evvoia (Euboea).
Slagelse, *old t.*, Sjaelland, Denmark; food inds.; iron and silver wks.; p. (1960) *20,562.*
Slanic, *t.*, Wallachia, Romania; on S. flank of Carpathian Mtns., 22 m. N. of Ploesti; impt. salt deposits; p. (1956) *6,842.*
Slask, *see* Silesia.
Slatina, *t.*, Romania; on R. Olt, 87 m. W. of Bucharest; ancient churches; p. (1956) *13,381.*
Slave, *R.*, N.W. Terr., Canada; flows into Gr. Slave L.
Slave Coast, portions of Guinea cst., W. Africa, embracing Dahomey and Nigeria.
Slavonia, former Crown land (with Croatia) of Hungary; now Jugoslavia.
Slavyansk, *t.*, Ukrainian S.S.R.; coal, chemicals, salt, engin.; p. (1959) *83,000.*
Sleaford, *mkt. t.*, *urb. dist.*, Kesteven, Lincoln, Eng.; 12 m. N.E. of Grantham; agr. and agr. implements malting, seeds; p. (1961) *7,834.*
Sleepers, The, *gr. of Is.*, Hudson Bay, Canada.
Slezsko, *see* Silesia.
Slieve Bloom, *hill range*, Offaly and Laoghis cos., Ireland; highest point 1,733 ft.
Slieve Donard, *mtn.*, N. Ireland; highest of the Mourne Mtns., co. Down; alt. 2,796 ft.
Sligo, *cst. co.*, Connacht, Ireland; pasture, tillage, barren mtn., and turf; livestock, fishing; a. 737 sq. m.; p. (1961) *53,558.*
Sligo, *t.* Sligo, Ireland; on Sligo Bay; distilling, flour, fisheries; p. (1961) *13,138.*
Slioch, *mtn.*, Ross and Cromarty, Scot.; 3,217 ft.
Sliven, *t.*, E. Roumelia, Bulgaria; famous for black wine; p. (1956) *46,383.*
Slough, *t.*, *mun. bor.*, Bucks, Eng.; on river terrace N. of R. Thames, 23 m. W. of London; many light inds.; p. (1961) *80,503.*
Slovakia, *old prov.*, ČSSR.; consists largely of Carpathian Mtns.; ch. t. Kosice; a. 18,902 sq. m.; p. (1961) *4,175,017.*
Slovenia, *fed. unit*, Jugoslavia; cap. Ljubljana (Laibach); a. 6,266 sq. m.; p. (1959) *1,589,000.*
Slupsk (Stolp), *t.*, Pomerania, Poland; German before 1945; cas.; machin., agr. implements; p. (1965) *59,000.*
Småland, *dist.*, S. Sweden; barren upland area S. of L. Vättern; moorland, deciduous forest; contrasts greatly with remainder of S. Sweden.
Smederevo, *t.*, Serbia, Jugoslavia; nr. Belgrade; p. (1959) *22,000.*
Smethwick, *co. bor.*, Staffs, Eng.; N.W. sub. of Birmingham; machin., engin., iron, glass; p. (1961) *68,372.*
Smichov, *t.*, ČSSR.; on R. Vltava; connected by bridge with Prague; mnfs.; p. *54,370.*
Smith Sound, Arctic Canada; connects Kane Bay with Baffin Bay.
Smoky Hill, *R.*, Col., Kan., U.S.A.; trib. of Kansas R.; length 400 m.
Smolensk, *c.*, R.S.F.S.R.; on both banks of the R. Dnieper; tallow, linen, iron and copper smelting, engin.; p. (1959) *146,000.*
Smyrna, *see* Izmir.
Snaefell, *highest mtn.*, I. of Man; alt. 2,034 ft.
Snake R. or **Lewis Fork,** trib. of Columbia R., flows from Wyo. to Wash., U.S.A.; length 1,050 m.
Sneek, *c.*, Friesland, Neth.; nr. Leeuwarden; yachting ctr.; mnfs.; p. (1967) *24,464.*
Sneeuwbergen, *mtn. range*, Cape Prov., S. Africa.
Snizort, Loch, *arm of sea* (14 m. long), N. of I. of Skye, Scot. [Norway; alt. 7,565 ft.
Snohetten, *mtn.*, highest in Dovrefjeld range,
Snowdon, *mtn.*, nr. Caernarvon, Wales; (highest in Eng. and Wales); alt. 3,571 ft.
Snowy, *R.*, N.S.W. and Victoria, Australia; rises in Mt. Kosciusko, flows S. into Bass Strait 80 m. W. of C. Howe; length 220 m. Snowy Mtns. project (1950–75) to provide hydroelec. power and irrigation.
Soar, *R.*, Leicester, Nottingham, Eng.; rises in uplands of S. Leics, flows N.W. through Leicester, Loughborough, into R. Trent nr. Long Eaton; hosiery and knitwear inds. in lower valley; 43 m. long.
Sobat, *R.*, Sudan, N.E. Africa; rises in S.W. of Abyssinian Highlands, flows N.W. into R. Nile 80 m. below L. No; one of ch. sources of Nile flood-water; Abyssinia receives monsoon rains April to Oct., max. discharge into White Nile, Nov. and Dec.; length over 500 m.
Soche, *see* Yarkand.
Sochi, *t.*, R.S.F.S.R.; on Black Sea at foot of main Caucasian range; health resort with subtropical climate and sulphur springs; developed since 1933; p. (1959) *95,000.*
Society Is., *archipelago*, S. Pac. Oc.; between the Tuamotu Archipelago and Friendly Is., under Fr. protection; ch. I. Tahiti; ch. prod. phosphate and copper; cap. Papeete; p. *37,303.*
Socotra, *Brit. I.*, G. of Aden, Indian Ocean; S. of Arabia and E. of C. Guardafui; livestock; exports "Dragon's Blood", myrrh, frankincense, aloes; a. 1,382 sq. m.; p. *c. 9,000.*
Sodbury, *rural dist.*, Glos, Eng.; aircraft, bricks, quarrying, coal-mining; p. (1961) *44,826.*
Söderhamn, *spt.*, Sweden; on G. of Bothnia, N. of Gavle; timber, wood-pulp, iron, engin.; p. (1961) *13,010.*
Södermanland, *co.*, Sweden; S.W. of Stockholm; a. 2,634 sq. m.; p. (1961) *227,615.*
Södertälje, *t.*, Sweden; on L. Malar; engin., tools, machin., cars, aluminium; p. (1961) *33,152.*
Soerabaya or **Surabaya,** *spt.*, Java, Indonesia; dockyards and arsenal; oil; exp. coffee, rice, cotton, sugar, tapioca; p. (1961) *1,007,000.*
Soerakarta, or **Solo,** *t.*, Java, Indonesia; p. (1961) *368,000.*
Soest, *c.*, N. Rhine–Westphalia, Germany; cath.; iron ind.; p. (1963) *34,200.*
Soest, *t.*, Utrecht, Neth.; artistic earthenware toys; p. (1967) *32,958.*

Süchow (Suzhou), *c.,* Kiangsu, China; on Tai-Hu, 40 m. W. of Shanghai; gr. comm. and industl. ctr., silks, cottons, rice; p. (1953) *c. 373,000.*

Sucre, *cap.,* Chuquisaca dep. and legal cap. of Bolivia; univ. and cath.; cement plant.; p. (1962) *54,270.*

Sucre, *st.,* Venezuela; cap. Cumana; p. (1961) *401,992.*

Sudan, The, *ind. sovereign st.* since Jan. 1956, N.E. Africa; formerly Anglo-Egyptian condominium; bounded by Egypt, Libya, Chad, Central African Rep., Congo, Uganda, Ethiopia, and Red Sea; cotton, gum arabic, hides, ground

nuts, sugar; iron ore mng.; cap. Khartoum; a. 967,500 sq. m.; p. (1961) *12,109,000*.
Sudanese Republic. *See* Mali.
Sudbury, *t., mun. bor.*, W. Suffolk, Eng.; on R. Stour, 12 m. N.W. of Colchester; p. (1961) *6,643*. [(1956) *46,025*.
Sudbury, *t.*, Ontario, Canada; nickel, copper; p.
Sudeten Mtns., *range*, Poland, Czechoslovakia; separating Bohemia and Moravia from Silesia.
Suez, *spt.*, U.A.R., N.E. Africa; at head of G. of Suez (arm of Red Sea) and S. entrance of Suez Canal, which crosses the Isthmus of Suez to the Mediterranean at Port Said and is of very gr. value to shipping; the ancient Arsinoë; Port Tewfiq adjoining has quay and docks; p. (1960) *203,000*.
Suez, *G.*, Red Sea; N.W. arm of Red Sea between Arabian Desert and Sinai Peninsula, Egypt; southern approach to Suez Canal; length 190 m., width varies from 12 to 25 m.
Suez Canal, *ship canal*, U.A.R., N.E. Africa; connects Mediterranean Sea (Pt. Said) with Red Sea (Suez) through Ls. Manzala, Timsah and Bitter; saves over 4,000 m. on journey N.W. Europe to India, 1,000 m. to Australia; opened 1869; length, 101 statute m.
Suffolk, *most E. maritime co.*, Eng.; bounded by Essex, Norfolk, Cambridge and the N. Sea; mixed agr., dairying; fisheries; mnf. of agr. implements; civil nuclear power-sta. at Sizewell, due 1966; co. t. Ipswich; a. 1,482 sq. m. divided for admin. purposes into Suffolk E. p. (1961) *342,696* and Suffolk W. p. (1961) *129,969*.
Suhl, *t.*, Suhl, E. Germany; toys, armaments; p. (1963) *26,907*
Suir, *R.*, Ireland; flows E. to Waterford Harbour.
Suiyuan, *former prov.*, China; now incorporated in Inner Mongolia Aut. Reg.
Sukarnapura, *formerly* **Kota Baru**, *cap.*, West Irian, Indonesia.
Sukhumi, *spt.*, Georgian S.S.R.; resort; sawmilling; p. (1959) *64,000*.
Sukkur, *t.*, Pakistan; on. R. Indus, 230 m. N.E. of Karachi; gr. dam for irrigation; thermal sta. under construction; p. (1961) *103,000*.
Sulaiman, *mtns.*, Asia; range bounding the Punjab and Baluchistan. [*272,442*.
Sulaimaniya, *liwa*, Iraq; a. 4,554 sq. m.; p. (1956).
Sulawesi (Celebes), I., Indonesia; mtnous., forested; copra, coffee, bauxite; ch. pt. Menado, Makasar; a. 73,160 sq. m.; p. (1961) *7,079,349*.
Sulina, *t.*, Romania; at mouth of Sulina branch of Danube R.; considerable grain tr.; p. *3,622*.
Sullana, *t.*, N. Peru; rly. ctr.; maize, cotton, cinchona bark, fishing, whaling; p. (1961) *23,000*.
Sultanabad, *t.*, Persia; carpet mftg.; p. *55,000*.
Sulu Is., Philippines; archipelago between Borneo and the Philippines; a. 950 sq. m.; acquired by the U.S.A. 1898.
Sumatra, *I.*, Malay Archipelago, Indonesia; coffee, sugar, rice, pepper; gold, tin, petroleum coal; a. 161,612 sq. m.; p. (1961) *15,739,363*.
Sumba, *I.*, Indonesia; part of Timor Archipelago.
Sumbawa, one of the Nusa Tenggara Is., Indonesia; in E. Indian Archipelago, E. of Lombok; a. (inc. nearby Is.) 5,240 sq. m.; p. *314,843*.
Sumgait, *t.*, Azerbaydzhan S.S.R.; on Caspian Sea; 25 m. N.W. of Baku; metallurgical ind.; chemicals; p. (1959) *52,000*.
Sumy, *t.*, Ukrainian S.S.R.; engin., chemicals, textiles; p. (1959) *97,000*. [m. long.
Sunart, Loch, *sea arm*, Argyll cst., W. Scot.; 19½
Sunbury-on-Thames, *urb. dist.*, Middx., Eng.; W. of London; residtl., water wks., gravel pits; petrol research establishment; p. (1961) *33,437*.
Sunda Strait, between Java and Sumatra, Indonesia; 13 m. wide, contains the volcanic I. of Krakatao.
Sundarbans, The, *tract of forest and swamps*, fringing the delta of the Ganges, E. Pakistan; 165 m. long, 81 m. wide; rice grown in N. tigers and crocodiles found in S.
Sunday I., lgst. of Kermadec Is., N.Z.; 20 m. in circuit and with a p. of *10* is the only one of the Kermadec Is. that is inhabited; met. and radio sta. established on I. [Algoa Bay; 200 m. long.
Sunday, *R.*, Cape Prov., S. Africa; flows into
Sunderland, *spt., co. bor.*, Durham, Eng.; at mouth of R. Wear; gr. shipbldg. and coal-exp ctr. (inc. Monkwearmouth and parts of Bishopwearmouth), best gas coal, also engin., glass, paper and rope; fine harbour, piers and docks· p. (1961) *189,629*.

Sundsvall, *spt.*, Västernorrland, Sweden; on a wide bay of the Baltic nr. Hernösand; timber and wood-pulp inds.; p. (1961) *29,493*.
Sungari, *R.*, N. China; trib. of R. Amur; inc. the Nonni; length over 1,000 m.
Sungpan, *t.*, Szechwan, China; silver, gold, lead; linseed oil, paper; smelting, engin.
Superior, *c.*, Wis., U.S.A.; at head of L. Superior; gr. tr. in grain, timber, coal, shipbldg. and flour mills; oil refining; p. (1960) *33,563*.
Superior, *L.*, N. America; lgst. sheet of fresh water in the world; lies between Canada and the U.S.A.; one of the chain of gr. Ls. in the St. Lawrence system; outlet to L. Huron by the St. Mary's R., receives the waters of the St. Louis, Pigeon and Nipigon; a. 32,000 sq. m.
Surat, *c.*, Gujarat, India; on R. Tapti; cotton, silk, embroidery; p. (1961) *288,026*.
Surbiton, *former mun. bor.*, Surrey, Eng., on R. Thames, nr. Kingston; now inc. in Royal Borough of Kingston-upon-Thames (*q.v.*); residtl.; light engin., bricks, tiles, elec. components; p. (1961) *62,940*.
Suresnes, *t.*, Seine, France; p. (1962) *40,151*.
Surinam, *R.*, Neth. Guiana, S. America; flows N. to Atl. Oc. nr. Paramaribo; length 300 m.
Surinam (Neth. Guiana), *Dutch col.*, S. America; ch. exp. bauxite, timber, rubber, rice, fruit; cap. Paramaribo; a. 55,000 sq. m.; p. (1956)) *350,000*.
Surinumu Dam, 30 m. from Port Moreby, Papua; part of hydro-elec. scheme; opened 1963.
Surrey, *S. co.*, Eng.; S. of R. Thames; cereals, livestock, vegetables; residtl.; a. 722 sq. m.; p. (1961) *1,733,036*.
Sus, *R.*, S. prov. Morocco, N. Africa; flowing to the Atlantic nr. Agadir; length 130 m.
Susa, *see* Sousse.
Susquehanna, *R.*, N.Y., Penns., and Md., U.S.A.; flows to Chesapeake Bay through highly industl. a.; routeway, W. from Philadelphia and Baltimore across Appalachian Mtns.; length 422 m.
Sussex, *maritime co.*, S.E. Eng.; adjoining Surrey, Kent and Hants, and washed by Eng. Channel; traversed E. to W. by the S. Downs; co. t. Lewes; a. 1,457 sq. m.; divided administratively into Sussex E. p. (1961) *664,669* and Sussex W. p. (1961) *411,224*.
Susten Pass, *modern alpine road*, alt. 7,296 ft., between Hasliltal and Reuss valley, links Bernese Oberland with Gotthard road.
Sutherland, *N. co.*, Scot.; N.W. Moray Firth, washed by Atlantic and N. Sea; grazing and forest land, most sparsely pop. in Scot.; mountainous, with many lochs; co. t. Dornoch; a. 2,102 sq. m.; p. (1961) *13,442*.
Sutherland Falls, Milford Sound, S.I., N.Z.; height 1,904 ft.
Sutlej, *R.*, West Pakistan; rises in the Himalayas and flows to the R. Indus; used for lge.-scale irrigation; length 1,000 m.
Sutton, *outer bor.*, Greater London, Eng.; inc. former bors. of Beddington and Wallington, Sutton and Cheam, and Carshalton; p. (1964) *169,019*.
Sutton Coldfield, *t., mun. bor.*, Warwick, Eng.; 6 m. N.E. of Birmingham; hardware, plastics; television transmitter; p. (1961) *72,143*.
Sutton-in-Ashfield, *t., urb. dist.*, Notts, Eng.; 3 m. S.W. of Mansfield; coal, light engin.; hosiery; p. (1961) *40,438*.
Suva, *c., cap.*, Fiji Is.; on Viti Levu I., fine harbour; p. (estd. 1965) *38,000*.
Suwalki, *t.*, N.E. Poland; nr. Lithuanian S.S.R. bdy.; timber, grain, woollens; p. (1965) *22,000*.
Suwannee, *R.*, Fla., and Ga., U.S.A.; flows to G. of Mexico; known as "Swanee River," length 250 m.
Svalbard, *see* Spitsbergen.
Svendborg, *spt.*, Fyn, Denmark; mnfs., earthenware, tobacco, exp. butter; p. (1960) *23,892*.
Sverdlovsk, *t.*, R.S.F.S.R.; on R. Iset, at E. base of the Ural Mtns.; steel, engin., chemicals, textiles; p. (1962) *853,000*. [of White Sea.
Sviatoi Nos, *C.*, Arctic cst., U.S.S.R.; nr. entrance
Svir, *R.*, U.S.S.R.; flowing between L. Onega and L. Ladoga; length 125 m.
Svistov, *t.*, Bulgaria; on R. Danube, Romanian border; p. (1956) *18,448*.
Svobodnyy, *t.*, R.S.F.S.R.; on R. Zeya, 105 m. N. of Blagoveshchensk; agr. equipment, sawmilling; p. (1959) *57,000*.
Svolvær, *spt.*, Norway; ch. t. Lofoten Is.; fishing; p. (1961) *3,821*. [cap. Augsburg.
Swabia, *dist.*, Bavaria, Germany; a. 3,807 sq. m.;

Swabian Alps, *mtns.*, Württemberg, Germany; inc. the Swabian Jura range between valleys of Neckar and Danube.

Tarija, *prov.*, Bolivia; cap. Tarija; a. 24,786 sq. m.; p. (1962) *142,600*.
Tarija, *t.*, *cap.*, Tarija prov., Bolivia; S.E. of Potosi; maize, wheat, vines; p. (1962) *20,851*.
Tarma, *t.*, Peru, S. America; alt. 9,980 ft.; maize, cotton, oranges, bananas; p. (1961) *7,860*.
Tarn, *R.*, France; trib. of R. Garonne; has famous rocky gorge 31 m. long in its upper course; length 235 m.
Tarn, *dep.*, S. France, watered by Tarn and its tribs.; wheat and wine; cap. Albi; a. 2,232 sq. m.; p. (1962) *319,560*.
Tarn-et-Garonne, *dep.*, W. France; corn, wine, woollens, paper, silk; cap. Montauban; a. 1,440 sq. m.; p. (1962) *175,847*.
Tarnow, *t.*, Poland; E. of Kraków; agr.; farm implements, glass; industl. development since 1950; p. (1965) *77,000*.
Tarragona, *prov.*, Spain; on the Mediterranean; vineyards and agr.; cap. Tarragona; a. 2,426 sq. m.; p. (1959) *364,075*.
Tarragona, *fortfd. spt.*, cap. Tarragona, Spain; at mouth of R. Franconi; mnfs. alcohol, liqueurs, chocolate, paper, silk, fish-salting; p. (1957) *42,000*.
Tarrasa, *t.*, Barcelona, Spain; in fruit and vine-growing dist.; royal college; thriving inds.; p. (1959) *86,469*.
Tarsus, *ancient c.*, Turkey; nr. Adana, opposite Cilician Gates; orange and citron groves; ruined Roman temple; birthplace of Apostle Paul; exp. cotton, wool, hides; p. (1965) *57,035*.
Tartary or **Tatary**, *region*, Central Asia; now divided into Chinese or E. Turkestan, and W. Turkestan, U.S.S.R.
Tartary, Gulf of, *arm of the Sea of Japan*, separating Sakhalin from the Siberian mainland.
Tartu (formerly **Dorpat**), *t.*, Estonian S.S.R.; univ.; saw milling, engin.; p. (1959) *74,000*.
Tarudant, *t.*, Morocco, N. Africa; mkt., orange water, leather, pottery, copper, brass; p. *12,877*.
Tashkent, *cap.*, Uzbek, S.S.R. on Syr Darya R.; univ.; extensive silk mnfs.; engin; pipeline from Gazli natural gas field; p. (1962) *1,002,000*.
Tasman Bay, *lge. inlet*, S.I., N.Z.; penetrates N. cst., between Separation Point and D'Urville I.; enclosed by mtns., sheltered, fertile, coastal fringe; ch. ts. Nelson, Motueka.
Tasman Glacier, S.I., N.Z.; one of the lgst. in the world.
Tasmania (formerly **Van Diemen's Land**), *I.*, *st.*, Australia; plateau with fertile valleys; temperate climate; forest and grasslands, grain, fruit, cattle-raising; aluminium, copper, zinc, lead, tin, silver; electro-metallurgical inds.; cap. Hobart; a. 26,215 sq. m.; p. (1964) *375,946*.
Tatar, A.S.S.R., U.S.S.R.; oil, natural gas; ch. t. Kazan on R. Volga; p. (1956) *2,847,000*.
Tatra Mtns. (**High Tatra**), highest Carpathian gr., Czechoslovakia, alt. 8,743 ft.
Tatung (**Datong**), *c.*, Shansi prov., China; impt. coalfield; p. (1953) *229,000*.
Taubaté, *t.*, Brazil; p. (1960) *64,863*.
Tauber, *R.*, Germany; trib. of R. Main; l. 74 m.
Taunton, *co. t.*, *mun. bor.*, Somerset, Eng.; on R. Tone at W. end of Vale of Taunton; old cas.; apples, cider, clothing tr., engin., plastics; p. (1961) *35,178*. [ries; p. (1960) *41,132*.
Taunton, *c.*, Mass., U.S.A.; cotton, iron found-
Taunus, *mtn. range*, Hessen, Germany; between the R. Lahn and the Rs. Rhine and Main.
Taupo, *L.*, N.I., N.Z.; lgst. L. in N.Z.; geysers, hot springs in vicinity; 25 m. by 17 m.
Taurida or **Krim**, *dist.*, Crimean Peninsula, U.S.S.R., separated from Ukraine by Perekop Peninsula, divided by R. Salgir; a. 24,540 sq. m.; wheat, tobacco, fruit.
Taurus Mtns., *range*, S. Turkey.
Tavastehus (**Häme**), *dep.*, Finland; cap. Tavastehus; a. 7,118 sq. m.; p. (1958) *573,444*.
Tavira, *t.*, S. Portugal; fishing; p. *12,364*.
Tavistock, *mkt. t.*, *urb. dist.*, Devon, Eng.; on R. Tavy, 12 m. N. of Plymouth; impt. mkt.; p. (1961) *6,086*.
Tavoy, *t.*, Burma; between Thailand and the Bay of Bengal, W. of Bankgok; rice, tin-mining.
Tavy, *R.*, Devon, Eng.; trib. of R. Tamar; length 20 m.
Taw, *R.*, Devon, Eng.; flows from Dartmoor to Barnstaple Bay; length 50 m.
Taxco, *t.*, Mexico; alt. 5,600 ft.; gold- and silver-mining; tourist ctr.; p. (1960) *10,076*.
Taxila, *t.*, W. Pakistan; heavy machin. wks. projected.
Tay, *R.*, Scot.; flows S.E. from Loch Tay in Perth to the Firth of Tay; longest R. in Scotland.
Tay Bridge, *rly. bridge*, E. Scot.; spans Firth of Tay from Wormit (Fife) to Dundee (Angus); carries main E. cst. rly. from Edinburgh to Aberdeen; length 2 m.; road bridge (longest in Britain) spanning R. at Dundee, opened 1966.
Tay, Firth of, *lge. inlet*, E. cst. Scot.; extends inland almost to Perth; length 27 m., max. width 3 m.
Tayabas, *t.*, Luzon, Philippines; on slope of extinct volcano Banajao; in rice- and coconut-growing dist.
Tayeh, *industl. t.*, Hupeh, China; lies to S. of Yangtze-Kiang, 42 m. S.E. of Wuhan; ctr. of very impt. iron-ore deposits; iron and steel inds., heavy engin.
Tayport, *burgh*, Fife, Scot.; at entrance to Firth of Tay; opposite Broughty Ferry; linen, jute; p. (1961) *3,151*.
Taz, *R.*, Siberia, R.S.F.S.R.; flows to Bay of Tazovsk in Gulf of Obi; length 300 m.
Tbilisi (**Tiflis**), *cap.*, Georgian S.S.R., petroleum refining, engin., textiles; natural gas pipeline to Ordzhonikidze; p. (1962) *743,000*.
Tczew (**Dirschau**), *t.*, Pomerania, Poland; on R. Vistula; rly. wks., sugar, agr. implements; p. (1965) *37,000*.
Team Valley, Durham, Eng.; impt. trading estate has been developed here.
Te Aroha, *t.*, N.I., N.Z.; between Hamilton and Thames; one of the ch. resorts in the thermal springs dist.; p. (1961) *3,058*.
Te Awamutu, *t.*, N.I., N.Z.; S. of Hamilton agr. and dairying dist.; p. (1961) *5,423*.
Tebessa, *t.*, Algeria; alt. 2,789 ft.; mkt.; embroidery, carpets; phosphate deposits near by.
Tecuci, *t.*, Romania; N.W. of Galati; battle, 1476 (between Stephen the Great and the Turks); p. (1963) *27,226*.
Teddington, *S.W. sub.* of London, inc. in Greater London outer bor. of Richmond-upon-Thames; National Physical Laboratory; p. (1961) *13,455*.

Tedzhen, *R.*, Turkmen and N. Persia; flowing into Hari-Rud.
Tees, *R.*, N. Eng.; flows E. from Pennines to N. Sea between Yorks and Durham; length 70 m.
Teesport, *oil refinery*, between Redcar and Middlesbrough due for completion 1967.
Teffe, *R.*, Brazil; trib. of R. Amazon; length 500 m. [*89,016.*
Tegal, *spt.*, Java, Indonesia; sugar; p. (1961)
Tegucigalpa, *c.*, *cap.*, Honduras, central America; lies on R. Choluteca; alt. 3,200 ft. above sea-level; univ.; inter-ocean highway, connecting the t. with both Caribbean Sea and Pacific constructed; bananas, p. (1965) *154,000.*
Tehran, *cap. c.*, Iran, 70 m. due S. of Caspian Sea; mftg. and comm. ctr., incl. car assembly; modern bldgs. and hotels; gas pipeline to U.S.S.R. projected; nuclear ctr. for CENTO; intern. airpt.; p. of t. and dist. (1965) *2,317,000.*
Tehri-Garhwal formerly Himalayan princely st., India, now merged tog. with Kampur and Benares, into st. of Uttar Pradesh.
Tehuantepec, *t.*, Mexico; on the Tehuantepec R., nr. the Pacific cst. of the Isthmus; once an Indian cap.; cath.; p. *10,087.*
Tehuantepec, Isthmus of, separates G. of Mexico from the Pacific at narrowest point of Mexico; width 130 m.
Teifi, *R.*, S.W. Wales; rises in Cambrian Mtns. nr. Strata Florida, flows S.W. and W. into Cardigan Bay 14 m. N.E. of Fishguard; forms bdy. between Cardigan and Carmarthen, Cardigan and Pembroke; sm. flannel ind. in ts. and vils. in lower valley; length 94 m.
Teign, *R.*, Devon, Eng.; flows to sea at Teignmouth from Dartmoor; length 30 m.
Teignmouth, *t.*, *urb. dist.*, Devon, Eng.; at mouth of R. Teign, 13 m. S. of Exeter; resort; yacht-bldg.; p. (1961) *11,576.*

Thailand (Siam), *kingdom*, S.E. Asia much; jungle; hot, abundant summer rainfall; mainly agr.; rice, rubber, teak-wood, jute, maize, cotton, tobacco, iron ore, tin, chem. fertilisers; cap. Bangkok; a. 200,418 sq. m.; p. (1960) *25,519,965.*
Thai Nyuyen, *t.*, N. Vietnam, S.E. Asia; iron and steel plant projected.
Thame, *mkt. t.*, *urb. dist.*, Oxford, Eng.; on R. Thame, 7 m. S.W. of Aylesbury, p. (1961) *4,197.*
Thame, *R.*, trib. of R. Thames, Eng.; length 35 m.
Thames, *R.*, Eng.; rises in the Cotswold Hills, Glos, and flows past Oxford, Reading, Windsor and London to the Nore; length 209 m.
Thames, *R.*, Ontario, Canada; flows into L. St. Clair; length 160 m.
Thames, *R.*, N.Z., flows N. to G. of Hauraki; length 86 m.

Thameshaven, *loc. oil refinery*, Essex, Eng.; on N. cst. of Thames estuary 8 m. below Tilbury.
Thanet, I. of, *loc. promontory*, N.E. extremity, Kent, Eng.; formed by bifurcation of R. Stour; contains Margate, Ramsgate and Broadstairs, with other seaside resorts.
Thanjavur, *t.*, Madras, India; silks, carpets, jewellery, inlaid metals; impt. Brahman ctr.; p. (1961) *111,099*.
Thar Desert, on bdy. between India and W. Pakistan; covers slopes between N.W. Deccan and irrigated valley of R. Indus; completely barren, lack of Rs. or level land prevents irrigation; crossed only by caravan routes.
Tharawaddy, *dist.*, Pegu, Lower Burma; mainly forest, with rice fields in the clearings; a. 2,815 sq. m.; p. of *dist. 508,319*; of *t. 7,131*.
Thaton, *dist.*, Tennasserim div., Burma; rice and tobacco.
Thaya, *R.*, Austria; trib. of the R. March; length 130 m.
Thebes, *ruined ancient cap.*, Upper U.A.R.; on both banks of R. Nile; site now partly occupied by vils. Karnak and Luxor; impt. arch. discoveries in Valley of the Kings in 1923.
Theiss, *see* **Tisa.**
Theodore, *t.*, Queensland, Australia; on R. Dawson; irrigation; cotton, fodder crops.
The Pas, *t.*, Manitoba, Canada; on R. Saskatchewan 80 m. upstream from L. Winnipegosis; rly. junction on line from Prairie Provs. to Churchill on Hudson Bay; branch line to Flin Flon.
The Sound, *see* **Sound, The.**
Thera, *volcanic I.*, Greek archipelago, Ægean Sea; 10 m. long; cap. Thera.
Thermopylæ or **Pylæ,** celebrated pass between Mt. Æta and the sea, N.E. Greece; battle between Persians and Spartans, 480 B.C.
Thesprotia, *prefecture*, Epirus, Greece; cap. Hegoumenitsa; p. (1961) *52,075*.
Thessaloniki (Salonika), *prefecture*, Greece; p. (1961) *542,880*.
Thessaloniki, *t.*, Greece; at head of G. of Thessaloniki; woollens, soap, cottons, brewing, import and exp. tr.; oil refining; contains fiscal free zone; p. (1961) *250,920*.
Thessaly, *dist.*, Central Greece; containing two main prefectures, Larisa and Trikkala; horse-breeding; a. 5,208 sq. m.; p. (1961) *695,385*.
Thetford, *t.*, *mun. bor.*, Norfolk, Eng.; on Little R. Ouse; industl. estate for London overspill projected; fruit and vegetable canning, pulp mftg., engin.; p. (1961) *5,398*.
Thetford Mines, *t.*, Quebec, Canada; asbestos mining ctr.; p. (1956) *19,316*.
Thibodaux, *t.*, S.E. La., U.S.A.; comm. and mkt. ctr. for agr. dist.; petroleum; p. (1960) *13,043*.
Thielt, *t.*, Belgium; 17 m. W. of Ghent; lace, wool, cotton, linen; p. (1962) *3,732*.
Thiers, *t.*, Puy-de-Dôme, France; cutlery; p. (1954) *16,243*.
Thiès, *t.*, Senegal, W. Africa; rly. ctr. and wkshps.; groundnuts; p. (1957) *39,100*.
Thika, *t.*, Kenya, E. Africa; nylon processing.
Thimphu, *cap.* Bhutan; hydro-elec. plant.
Thionville, *t.*, Moselle, N. France; nr. Luxembourg border; fruit, vegetables, tanning, brewing; p. (1954) *23,054*.
Thirlmere, *L.*, Cumberland, Eng.; 3 m. long; furnishes part of the water supply of Manchester by a conduit of 96 m.
Thirsk, *mkt. t.*, *rural dist.*, N.R. Yorks, Eng.; in wide gap between Pennines and Cleveland Hills, 7 m. S.E. of Northallerton; flour; p. (rural dist. 1961) *13,060*.
Thisted, *t.*, Thyland, Denmark; on Lim Fjord; p. dairy prod., brewing; p. (1960) *8,768*.
Tholen, *I.*, S.W. Netherlands; a. 46 sq. m.; p. *15,000*.
Thok-Jalung, *t.*, Tibet; in Aling Kangri Mtns.; gold-mining ctr.
Thomar, *t.*, Portugal; paper, cheese; route ctr.; *11,333*.
Thomasville, *c.*, Ga., U.S.A.; cotton region; p. (1960) *18,246*.
Thompson, *R.*, B.C., Canada; rises in Monashee Mtns. flows S.W. into R. Fraser 140 m. upstream from Vancouver; valley forms impt. routeway used by trunk rlys. from Vancouver E. towards Yellowhead Pass (Canadian National Rly.) and Kicking Horse Pass (Canadian Pacific Rly.); length approx. 280 m.
Thompson, *t.*, Manitoba, Canada; nickel producing a'
Thonburi, *c.*, Thailand; industl. ctr.; rice and saw mills; p. (1964) *460,000*.
Thonon-les-Bains, *t.*, Haute Savoie, France; resort on L. Geneva; p. (1954) *14,016*.
Thorez, *t.*, Ukrainian S.S.R.; formerly Chistyakovo; coalmng.; p. (1959) *92,000*.
Thornaby-on-Tees, *t.*, *mun. bor.*, N.R. Yorks; opposite Stockton-on-Tees; iron and steel mnf., heavy engin., wire ropery, flour and sugar milling; p. (1961) *22,786*.
Thornbury, *mkt. t.*, *rural dist.*, Glos, Eng.; 10 m. N. of Bristol; aircraft mftg.; p. (rural dist. 1961) *30,685*.
Thornton Cloveleys, *t.*, *urb. dist.*, Lancs, Eng.; 4 m. N.E. of Blackpool; p. (1961) *20,642*.
Thörshavn, *cap.*, *pt.*, Faroe Is.; p. (1960) *7,447*.
Thousand Isles, *L.*, at outfall of L. Ontario; the islets really number 1,500–1,800, and are partly situated in N.Y. State and partly in Canada.
Thrace, ancient name of terr. in S.E. Europe, part of which has been added to Greece; successively under Macedonian, Roman, Byzantine and Turkish rule, before passing to Greece; tobacco; a. 3,315 sq. m.; p. (1961) *356,555*.
Three Kings, *gr. of Is.*, N. of N.Z.; plants and shrubs of extreme rarity.
Three Points, *c.*, Ghana; W. extremity of Bight of Benin.
Three Rivers (Trois Rivières), *c.*, *pt.*, Quebec, Canada; at confluence of St. Maurice and St. Lawrence Rs.; wood-pulp mnf.; exp. grain, cattle; p. (1956) *50,483*.
Thule, N.W. Greenland; 1,000 m. from N. Pole; American air base and site of ballistic missile early warning sta.; spt. open 2–3 mths. p.a.
Thun, *L.*, Berne can., Switzerland; occupies valleys of R. Aar where it leaves Alpine region; separated from L. Brienz by deltaic neck of land on which is Interlaken; a. 38 sq. m.
Thun, *t.*, Berne, Switzerland; on N.W. end of L. Thun, 16 m. S.E. of Berne; mil. training ctr.; cas. on hill above t.; p. (1957) *24,157*.
Thur, *R.*, Switzerland; flows to R. Rhine, nr. Schaffhausen; length 70 m.
Thurgau, *can.*, N.E. Switzerland, on L. Constance, watered by Thur R.; dairying, fruit, textiles; cap. Frauenfeld; a. 388 sq. m.; p. (1961) *166,420*.
Thuringia, *former Land*, E. Germany, bordered on Bavaria to S., Saxony-Anhalt, Lower Saxony and Hesse to N. and E.; drained by Rs. Saale and Werra; crossed by Thuringer Wald and extending to Harz mtns.; cap. Weimar; now dists. of Erfurt, Suhl and Gera.
Thuringian Forest or **Thüringer Wald,** *wild. wooded hill range*, Central Germany; 95 m. long; famous for romantic scenery and legends.
Thurles, *mkt. t.*, Tipperary (N. Riding), Ireland; on R. Suir; horse fair; p. (1961) *6,421*.
Thursday, *I.*, Torres Strait, Queensland; pearl and trochus fishery ctr.; p. (1957) *1,550*.
Thurso, *burgh*, Caithness, Scot.; on Thurso Bay; most N. t. on Scottish mainland; ancient stronghold of the Northmen; p. (1961) *8,038*.
Tiaret, *t.*, W. Algeria, N. Africa; in strategic pass; walled; agr. mkt.; cereals, wool, cattle; p. *22,344*.
Tiber, *R.*, Italy; flows from Apennines to Mediterranean, passing through Rome; l. 220 m.
Tiberias, *t.*, Israel; on Sea of Galilee (Lake Tiberias); gypsum quarried near by; inland pt.; p. (1946) *11,810*.
Tibesti, *mtns.*, on bdy. between Libya and Chad, Equatorial Africa; barren in spite of slight rainfall; mainly above 6,000 ft., maximum alt. 11,155 ft.
Tibet, *aut. reg.*, China; lofty plateau, called "the roof of the world", its lowest plains being 12,000 ft. above sea-level; semi-desert; Chinese suzerainty restored, 1951; network of roads being built, inc. one across Himalayas to Katmandu.; exp. wool, musk, gold, skins, and drugs; cap. Lhasa; a. 70,003 sq. m.; p. c. *6,000,000*.
Ticino or **Tessin,** *can.*, Switzerland; forests, vineyards, olives, agr.; contains parts of Ls. Maggiore and Lugano; cap. Bellinzona; lgst. t. Lugano; a. 1,086 sq. m.; p. (1961) *195,566*.
Ticino, *R.*, Switzerland and Italy; trib. of Po; forms S. approach to St. Gotthard Pass; length 150 m.

Tickhill, *urb. dist.*, W.R. Yorks, Eng.; cas.; p. (1961) *2,584*.

Tidore I., Moluccas, Indonesia; coffee, tobacco, fruit; a. 30 sq. m.; p. *19,126*.

Tien Shan or Celestial Mtns., *lofty chain*, N. frontier China, Sinkiang-Kirghizia; hgst. peak 24,000 ft.

Tientsin (Tianjing), *c. former treaty pt., mun. prov.*, Hopei, China; 70 m. S.E. Peking; cottons silks; exp. wool, skins, soya-beans; tractor plant; p. (1953) *2,693,831*.

Tierra del Fuego, *archipelago*, extreme S. America, separated from Patagonia by Strait of Magellan, divided politically between Chile and Argentina; a. (Argentine part) 8,344 sq. m.; p. *7,500*; oil field at Rio Grande.

Tiffin, *c.*, Ohio, U.S.A.; milling, brewing, foundries; p. (1960) *21,478*.

Tigre, *st.*, Ethiopia, formerly an independent kingdom; cap. Adua.

Tigre, *R.*, S. America; rises in Ecuador and flows mainly through Peru to the R. Marañon (Amazon); length 400 m.

Tigris, *R.*, Turkey; rising in mtns. of Armenia and Turkestan, flowing S.E. to join the Euphrates 40 m. N.W. of Basra; length 1,100 m.; dam projected 35 m. N. of Mosul

Tikhvin, *t.*, R.S.F.S.R.; on R. Syas; aluminium ores; p. (1954) *50,000*.

Tilburg, *c.*, N. Brabant, Neth.; nr. Breda; woollens, textiles, tobacco, leather; p. (1967) *148,497*.

Tilbury, *t.*, Essex, Eng.; on N. bank of R. Thames, 20 m. E. of London; docks; shoe mftg; p. (1961) *18,387*.

Till, *R.*, N. Northumberland, Eng.; trib. of R. Tweed; length 32 m.

Tillicoultry, *burgh*, Clackmannan, Scot.; on Devon R.; woollen, worsted, paper mkg.; p. (1961) *3,963*.

Tilmanstone, *mining vil.*, Kent, Eng.; on N. flank of N. Downs, 4 m. S.W. of Deal; on Kent coalfield, coal despatched by overhead cable to Dover.

Timaru, *t.*, S.I., N.Z.; wool, milling, skins; p. (1961) *26,419*.

Timbuktu, Mali, Africa; 8 m. N. of the N. bend of R. Niger, on border of the Sahara desert; agr. tr. ctr.; p. (1957) *7,000*; flourished as comm. mart. and Moslem ctr., 14–16th cent.

Timisoara, *t.*, W. Romania; impt. comm. and industl. ctr., tobacco, petroleum, paper; fortress, cas., cath.; p. (1963) *167,907*.

Timmins, *t.*, Ontario, Canada; gold running out; vast deposits of copper, zinc, silver, discovered 1964; p. (1961) *29,270*.

Timor, *Portuguese possession*, E. Indies; consists of E. part of T.I. in Malay Archipelago, together with Ambeno, Pulo Cambing and Pulo Jako; ch. products coffee, sandalwood, copra, wax; cap. and ch. spt. Dili; total a. 7,330 sq. m.; p. (1950) *442,378*.

Timor Archipelago, *gr. of Is.*, Indonesia; of which the lgst. is Timor (E. part Portuguese; remainder Indonesian); total a. 24,450 sq. m.; fishing, exp. copra; p. *1,657,376*.

Timor Sea, that part of the Indian Ocean N.W. of W. Australia, and S. of Timor I.

Timsah, *L.*, U.A.R., N.E. Africa; sm. L. midway along Suez Canal; formerly used for recreational purposes by Brit. garrison in Canal zone.

Tinogasta, *t.*, Catamarca prov., Argentina; in E. foot-hills of Andes 120 m. N.W. of Catamarca; impt. copper-mines.

Tintagel, *vil.*, Cornwall, Eng.; ruined cas.; reputed birthplace of King Arthur; tourists.

Tinto, *R.*, Huelva, Spain; flows W. to the Atlantic; length 65 m.

Tinto Hills, Lanark, Scot.; highest peak 2,300 ft.

Tipperary, *inland co.*, Munster, Ireland; a. 1,659 sq. m.; divided into Tipperary co. (N.R.), p. (1961) *53,689*; and Tipperary co. (S.R.), p. (1961) *70,090*.

Tipperary, *t.*, Tipperary, Ireland; 29 m. S.E. Limerick; mftg., butter, lace; p. (1961) *4,703*.

Tipton, *t., mun. bor.*, Staffs. Eng.; 2 m. W. of W. Bromwich; metals, engin.; p. (1961) *38,091*.

Tiranë, *t., cap.*, Albania; univ.; textiles, metallurgy; p. (1966) *153,000*.

Tiraspol, *t.*, Moldavian S.S.R.; on R. Dniester; heat and power-sta. recently constructed, milling tobacco; p. (1959) *62,000*.

Tire, *t.*, Aydin, Turkey; raisins, tobacco, cotton; p. (1965) *27,248*.

Tiree, *I.*, Inner Hebrides, Scot.; off cst. of Mull; sm. fresh-water lochs and Scandinavian forts.

Tirlemont (Flemish Thienen), *t.*, ctr. of Belgian sugar-refining; Brabant, Belgium; machin., woollens, leather; captured by Marlborough, 1705; p. (1962) *22,766*.

Tiruchirapalli, *formerly* Trichinopoly, *t.*, Madras, India; on R. Cauvery; cigars, goldsmith's wk.; boiler plant; p. (1961) *249,862*.

Tisa (Tisza), *R.*, U.S.S.R., Hungary, Jugoslavia; rises in E. Carpathians, flows N.W. to Cop, thence S. across flat, agr. plain of Gr. Arföld into R. Danube 45 m. below Novi Sad; approx. length 600 m.; navigable in part.

Tiszapalkonya, *t.*, Hungary; new town; chemical ctr.

Titicaca, *L.*, Bolivia, Peru, S. America; between 2 ranges of the Andes, on borders of Bolivia and Peru; 12,645 ft. above the sea; a. 3,200 sq. m.; average width 27 m. length 101 m.; almost cut in two by peninsula of Copacabana; nearly 700 ft. deep on E. side, shallow W. and S.; contains numerous Is., lgst. Titicaca; it is drained on the S. side by the R. Desaguadero.

Titograd (Podgorica), *t.*, Montenegro, Jugoslavia; nr. Albanian frontier; p. (1959) *22,000*.

Titov Veles, *t.*, Jugoslavia; on R. Vardar, and main rly. to Belgrade; maize, silk; p. (1960) *25,100*.

Tiverton, *mkt. t., mun. bor.*, Devon, Eng.; 14 m. N. Exeter; lace and silk mftg.; p. (1961) *12,296*.

Tivoli, *t.*, Rome, Italy; sulphur baths.

Tjirebon, *t.*, Java, Indonesia; oil refining; p. (1961) *158,299*.

Tlaxcala, *st.*, Mexico; adjoining Puebla; a. 1,555 sq. m.; cap. Tlaxcala; p. (1960) *346,699*.

Tlemcen, *t.*, Algeria, N. Africa; exp. textiles, carpets, ostrich feathers, olive oil, grain and onyx; p. (1954) *73,000*.

Tobago, *I.*, with Trinidad *indep. st.* within Brit. Commonwealth (1962); exp. sugar, rum, rubber, cotton, tobacco, coffee, etc.; cap. Scarborough on S. side; a. 116 sq. m.; p. (1960) *33,200*, nearly all Negroes.

Tobata, *c., spt.*, N. Kyushu, Japan; now part of Kitakyushu City newly formed 1963 (*q.v.*) on S. shore of Shimonoseki Strait at ent. to Tokai Bay; iron and steel ind., engin., sugar-refining, glass, bricks; lge. mod. coal docks; p. (1947) *84,260*.

Tobermory, *burgh*, Argyll, Scot.; on I. of Mull at N. entrance to Sound of Mull; p. (1961) *668*.

Tobol, *R.*, W Siberia, R.S.F.S.R.; trib. of R. Irtysh; length 500 m.

Tobolsk, *t.*, W. Siberia, R.S.F.S.R.; on R Irtysh; shipbldg., sawmilling, fishing; p. (1956) *35,300*

Tobruk, *spt.*, Libya, N. Africa; on cst. 220 m. E. of Benghazi; p. (estd. 1951) *2,500*.

Tocantins, *R.*, provs. Pará and Goiaz, Brazil; flows N. through the Pará estuary to the Atlantic; navigation interrupted by rapids 200 m. above Pará; length, 1,700 m.

Toce, *R.*, N. Italy; rises in Lepontine Alps, flows S. and S.E. into L. Maggiore; valley used by trunk rly. from Milan to Berne as S. approach to Simplon Tunnel; length, 54 m.

Tocopilla, *spt.*, Chile; exp. nitrate, copper ore, sulphates, iodine; p. (1960) *22,244*.

Todmorden, *mkt. t., mun. bor.*, W.R. Yorks, Eng.; nr. source of R. Calder, 6 m. N.E. of Rochdale; cottons, machin.; p. (1961) *17,416*.

Togliatti, *t.*, R.S.F.S.R., U.S.S.R.; formerly Stavropol; on R. Volga, 35 m. W.N.W. of Kuybyshev; engin., motor wks., natural gas; p. (1959) *140,000*.

Togo Republic of, *indep. sov. st.* (April 1960), W. Africa, formerly U.N. trust terr. under French adm.; cap. Lomé; mainly agr.; yams, sweet potatoes, green peppers, beans, millet, sorghum, coffee, cocoa; phosphate plant; a. 21,220 sq. m.; p. (1961) *1,440,000*. (Br. Togoland integrated in Ghana on achieving independence 1957.)

Tokaimura, *vil.*, Ibaraki, Japan; nuclear reactor and lge. nuclear power sta.

Tokat, *t.*, Turkey; on Tokat I., N. of Sivas; copper and yellow leather mftg.; Armenian massacre 1895; p. (1965) *38,006*.

Tokelau or Union Isles, gr. of 3 Is., Brit. col., Pac. Oc.; 300 m. N. of W. Samoa administered by N.Z.; a. 4 sq. m.; p. (1959) *7,861*.

Tokio, *c., spt., cap.*, Japan; on Tokio Bay, S.E. cst. of Honshu; univ., imperial palace; gr. comm. ctr; silks, machin., lacquer, pottery, "chlorela" artificial food production, metal tableware, chemicals; p. (1965) *8,893,094*; of Greater Tokio *10,869,000*.

Tokoroa, *t.*, N.I., N.Z., township to serve Kinleith; kraft paper, pulp, and sawn timber; p. (1961) *7,054*.

Tokushima, *t.*, E. cst. Shikoku, Japan; cottons, reed organs; p. (1965) *193,233*.
Tolbukhin, *t.*, Bulgaria, former Dobrich; p. (1956) *42,815*.
Toledo, *prov.*, Spain; mtnous.; agr., vineyards, stock-raising; a. 5,925 sq. m.; p. (1959) *531,824*.
Toledo, *ancient c.*, *cap.*, Toledo, Spain; on R. Tagus; with cath., and many specimens of Gothic, Moorish and Castillian architecture in its picturesque narrow streets; famous Alcázar palace citadel; sword-mkg. still flourishes; p. (1957) *46,465*.

Tuxtla Gutierrez, *t.*, Chiapas, Mexico; alt. 1,500 ft.; ctr for sisal, tobacco, coffee, cattle; p. (1960) *28,262*.

Tuzla, *t.*, Jugoslavia; salt-springs, coal, timber, livestock, grain, fruit; p. (1959) *49,000*.

Tweed, *R.*, S.E. Scot.; rises in Peebles, and reaches sea at Berwick; dividing Berwick from the Eng. co. Northumberland; famous for its salmon fisheries; length 97 m.

Twelve Pins, star-shaped *mtn. range*, Galway, Ireland; Benbaum, alt. 2,395 ft.

Twickenham, *former mun. bor.*, Middx., Eng., now inc. in Richmond upon Thames (*q.v.*); Rugby Football Union ground; p. (1961) *100,822*.

Tychy, *t.*, Katowice, Poland; p. (1965) *63,000*.

Tyldesley, *t.*, *urb. dist.*, Lancs, Eng ; 4 m. S. of Bolton; mnfs.; p. (1961) *16,813*

Tyler, *c.* Texas, U.S.A.; fruit, livestock, cotton; p. (1960) *51,230*.

Tynagh, *mine* on Loughrea, Galway, R.O.I.; lead, zinc, copper.

Tyne, *R.*, Durham and Northumberland, Eng.; formed by junction of N and S. Tyne at Hexham; flows E. to sea at Tynemouth and S. Shields; valley gives easy route across mtns. from Newcastle to Carlisle; forms a continuous harbour (with shipbldg. and other wks.) from Newcastle to Tynemouth; length 80 m.; road tunnel between Wallsend and Jarrow under constr.

Tynemouth, *t.*, *spt. co. bor.*, Northumberland, Eng.; at mouth of R. Tyne, on its N. bank; inc. in its a. the townships of Tynemouth, N. Shields, Cullercoats, Chirton, Preston, Percy Main, E. Howden and New York; favourite wat. pl. with old priory and cas ; gd. harbour; fishing, ship repairing, coal bunkering laminated plastics; oil storage; p. (1961) *70,112*.

Tyneside, *lge. conurbation*, S.E. Northumberland, N.E. Durham, Eng.; comprises highly industl. built-up a. astride R. Tyne for 14 m. from its mouth to Scotswood Bridge; huge exp. of coal, abroad and round Brit. csts.; shipbldg., heavy engin.; a. 90 sq. m.; p. (1961) *852,341*. *See also under* **Gateshead, Newcastle upon Tyne, S. Shields, Tynemouth, Jarrow, Wallsend, Felling, Hebburn, Gosforth, Longbenton, Newburn, Whickham, Whitley Bay.**

Tyre, or **Sur**, *t.*, Lebanon, S.W Asia; on W. cst.; p. *9,455*.

Tyrol, *mountainous region*, Alps, Europe; falls within Austria and Italy; between Munich and Verona, which are linked by the Brenner Pass; the Tyrol embraces all the highest peaks of the Austrian Alps, culminating in the Ortler Spitz; two-fifths forest; cap Innsbruck; mtn. pasture, vineyards, silk inds.; a. 4 884 sq. m.; p. of Austrian T. (1961) *462,899*.

Tyrone, *inland co.*, N. Ireland; agr. and dairying; cap. Omagh; a. 1,260 sq. m.; p. (1961) *133,930*.

Tyrrhenian Sea, part of Mediterranean between Italy and Corsica, Sardinia and Sicily.

Tyumen, *t.*, R.S.F.S.R.; on R. Tura, engin., textiles; natural gas nearby in Berezovo vil.; p. (1959) *150,000*.

Tzekung (Zigong), *c.*, Szechwan, China; petroleum, natural gas, salt wks.; p. (1953) *291,000*.

Tzepo (Zibo), *c.*, Shantung, China; formed by merging 1950 coal mng. ts. of Tzechwan and Poshan and 1954 addition of Changchow; p. (estd.) *284,000*.

U

Uanapú or **Anapú**, *R.*, Brazil; trib. of R. Pará length 400 m.

Ubangi, *R.*, central Africa; trib. of R. Congo; with R. Congo forms W. bdy. between Central African Rep. and Congo; length 1,400 m.

Ubangi-Shari, *see* **Central African Republic.**

Ube, *spt.*, S. Honshu, Japan; chemical cement machin., coal; p. (1950) *128,569*.

Ubeda, *t.*, Jaen Spain; on R. Guadalquivir; in vineyard and fruit-growing dist.; old walls; p. (1957) *30,249*.

Uberaba, *t.*, Minas Gerais, Brazil; cattle, maize, manioc, rice, sugar; p. (1960) *72,053*.

Ucayali *R.*, Peru, S. America; head-stream of R. Amazon; over 1,400 m. long navigable for 1,000 m. (1962) *73,169*.

Uccle, *t.*, Belgium; nr. Brussels; industl.; p.

Ucha Reservoir, *see* **Moscow Sea.**

Uckfield, *mkt. t.*, *rural dist.*, E. Sussex, Eng.; 8 m. N.E. of Lewes; p. (rural dist. 1951) *43,132*.

Udaipur, *t.*, Rajasthan, India; 2,469 ft. above sea-level; marble palace of the Maharajah; temple of Siva; embroidery, cotton cloth; p. (1961) *111,139*.

Uddevalla, *spt.*, S. Sweden; N. Göteborg; prefab. houses, timber, granite quarrying, textiles; p. (1961) *34,290*.

Udi, *t.*, S. Nigeria, W. Africa; 100 m. N. of Pt. Harcourt; impt. mining ctr. on Enugu coal-field; linked by rail to Kaduna and Pt. Harcourt.

Udine, *t.*, N.E. Italy; between Alps and G. of Venice; old cas. (now barracks); silk, velvet, and cotton inds.; p. (1961) *85,205*.

Udmurt, *autonomous Soviet Socialist Rep.*, part of R.S.F.S.R., U.S.S.R., cap. Izhevsk.

Uelzen, *t.*, Lower Saxony, Germany; on Lüneberger Heath; machin. chemicals, sugar; p. (1963) *24,500*.

Ufa, *t.*, R.S.F.S.R.; in W. Urals at confluence of Rs. Ural and Belaia; iron and copper foundries and machin. wks., saw-mills, textiles, oil; p. (1962) *610,000*.

Uganda, *indep. sov. st.* within Br. Commonwealth (1962); E. Central Africa; ch. R. Nile; Ruwenzori Range, Mt. Elgon on Kenya border; Ls. inc. parts of Victoria, Edward, Albert, and whole of Kioga; moderate rainfall; cotton, coffee, tea, oilseeds, tobacco, groundnuts, maize; copper, beryl, tin; timber; Owen Falls hydro-elec. power plant; cap. Kampala; a. 93,981 sq. m. inc. 13,680 sq. m. swamp and water; p. (estd. 1964) *6,845,000*.

Ughelli, *t.*, Nigeria; glass wks.

Uinta, *mtn. range* Utah, U.S.A.; its highest points are Emmons (13,694 ft.), Gilbert Peak (13 687 ft.), and Wilson (13,300 ft.).

Uist, N., *I.*, Outer Hebrides, Inverness, Scot.; separated from I. of Skye by Little Minch; length, 17 m., width 3–13 m.

Uist, S., *I.*, Outer Hebrides, Inverness, Scot.; most S. lge. I. of Outer Hebrides gr.; length 22 m., width 8 m

Uitenhage, *t.*, Cape Prov., S. Africa; summer resort, fruit, wool, rly. wks., tyres, car assembly, textiles; p. (1960) *48,755* inc. *17,531* whites.

Ujiji, *t.*, in sm. terr. same name (a. 920 sq. m.) on E. shore L. Tanganyika, E. Africa; where Stanley found Livingstone, 1871; p. (1957) *12,149*.

Ujiyamada, *t.*, Japan; sacred c. of Shintoism; p. (1947) *63,093*.

Ujjain, *t.*, Madhya Pradesh, India; sacred c. and formerly cap. of Malwa; univ.; p. (1961) *144,161*.

Ujpest, *t.*, Hungary; nr. Budapest; elec. engin.; p. *76,000*.

Ukerewe, *I.*, on L. Victoria, Central Africa.

Ukpilla, *t.*, Nigeria; cement wks.

Ukraine, *constituent rep.*, U.S.S.R.; fertile "black earth" region; agr., wheat, maize, barley; tobacco, sheep, pigs; coal, iron-ore, manganese; mnfs., flour, sugar, brewing, chemicals, smelting, hydro-elec., oil; cap. Kiev; a. 225,000 sq. m.; p. (1959) *41,893,000*.

Ulan Bator, *t.*, *cap.*, Mongolian People's Republic; in stock-raising region; comm. ctr.; clothing; formerly called Urga; p. (1962) *218,000*.

Ulan-Ude, (Verkhneudinsk), *t.*, Siberia, R.S.F.S.R.; on L. Baikal; engin., textiles, glass, leather; p. (1959) *174,000*.

Ulcinj, *ancient c.*, Montenegro, Jugoslavia; tobacco olive oil; p. *5,000*.

Uleåborg (Oulu), *spt.*, Finland; on G. of Bothnia; shipbldg exp. pitch, timber, hides, butter; p. (1961) *59,163*.

Ulhasnagar, *c.*, Maharashtra, India; new c. built for refugees from Pakistan; p. (1961) *107,760*.

Ullswater, *L.*, on border Cumberland and Westmorland, Eng.; 8 m. long; outlet by R. Eamont to the Eden.

Ulm, *c.*, Baden-Württemberg, W. Germany; on R. Danube; cath.; machin., textiles, cars, radios; rly junction; p. (1963) *94,400*.

Ulster, *anc. Irish prov.*; comprised nine counties: six of these (Down, Antrim, Armagh, Fermanagh, Londonderry and Tyrone) now form Northern Ireland, a. 5,238 sq. m.; p. (1961) *1,423,127*; three counties (Cavan, Monaghan, Donegal) are in the Rep. of Ireland; largely agr. tourism; gr. industl. expansion; a. 3,123 sq. m.; p. (1961) *217,489*.

Ulva, *I.*, Argyll, Scot.; off W. cst. of Mull; 5 m. long.

Ulverston, *t.*, *urb. dist.*, N.W. Lancs, Eng.; nr. Morecambe Bay; paper-mills, hardware mftg.; iron, corn, brewing; p. (1961) *10,515*.

Ulyanovsk, *t.*, R.S.F.S.R.; on R. Volga; engin., textiles; p. (1959) *205,000*.

Uman, *t.*, Ukrainian S.S.R.; iron; p. (1954) *50,000*.

Umbria, *region*, Italy; between Tuscany and the Marches, and Rome and the Abruzzi; comprising the prov. of Perugia; mtnous., fertile valleys; a. 3,271 sq. m.; p. (1961) *788,546*.

Ume älv, *R.*, Sweden; flows S.E. to the G. of Bothnia; length 250 m.

Umeå, *t.*, Sweden; at mouth of Ume älv; wood-pulp; cultural ctr.; p. (1961) *22,623*.

Umtali, *t.*, Rhodesia; impt. distr. ctr., timber, fruit, veg., car assembly, engin., textiles; oil refinery at Feruka; pipeline to Beira p. (1961) *41,900* inc. *8,410* whites.

Umtata, *c.*, S. Africa; cath.; veg., dehydration, fruit canning; rly. terminus; p. (1960) *12,287* inc. *3,439* whites.

Una, *R.*, N. Jugoslavia; trib. of R. Sava.

Unalaska, *lge. I.*, Alaska, U.S.A.; in Aleutian gr.; mtnous., treeless; ch. pt. of Bering Strait.

Uncia, *t.*, Oruro dep., Bolivia; alt. 13,000 ft. in E. Cordillera of Andes, 60 m. S.E. of Oruro; site of impt. Patino tin-mines.

Ungava Bay, *arm of Hudson Strait*, projecting into Labrador, N.E. Canada; lge. forests in the S., minerals abundant, recent exploitation of impt. medium and low-grade iron deposits.

Union of African States, union formed by Ghana, Guinea, Mali (1 July, 1961).

Union of South Africa—*see* **South Africa, Rep. of.**

Union of Soviet Socialist Republics, *cty.*, Europe, Asia; stretches across two continents from the Baltic Sea to the N. Pac. Oc. and from the Arctic to the Black Sea, bounded on the W. by Finland, Poland, Hungary and Romania, on the S. by Turkey, Persia, Afghanistan, and China; The Union consists of 15 Union Republics; R.S.F.S.R., Ukranian, Byelorussian, Azerbaydzhan, Georgian, Armenian, Turkmen, Uzbek, Tadzik, Kazakh, Kirghiz, Moldavian, Estonian, Lithuanian and Latvian S.S.R.'s. These reps. are divided into 126 terrs. and regions which include 18 autonomous reps., 10 autononomous regions and 10 national areas. European portion, separated in the E. from Asia by Ural Mtns., is a vast low plain with Caucasus Mtns. in the S. In Asia the ctr. and N. is occupied by the vast plain of Siberia, rising in the S. to lofty mtn. ranges, Pamirs, Tien Shan, Sayan, Yablonovy, Stanovoi, etc. Rs. are impt.: Dnieper, Volga, Ural and Don in Europe flowing southwards; Ob, Yenisei and Lena in Asia flowing northwards into Arctic Ocean; and Amur into Pac. Oc. N. and central regions—long, cold winters; short, cool summers, S. regions—temperate and sub-tropical; desert and semi-desert E. of Caspian Sea. In N. tundra and immense forests with lumbering and associated inds.; agr., wheat, oats, barley, rye, flax, potatoes, sugar-beet, tobacco, cotton, silk, rubber, vines, tea, rice; rich fisheries; impt. minerals; coal, oil, lignite, iron ore, manganese, chrome ore, platinum, copper, lead, zinc, nickel, uranium, asbestos, mica, apatite, nepheline bauxite; many hydro-elect. plants inc. lgst. in Europe; nuclear power stas.; good rly. and canal systems; highly developed inds. inc. metallurgical prods., textiles, chemicals, cellulose-paper and lumbering, leather goods, food-stuffs preparation. Ch. spts. Leningrad, Murmansk, Arkhangelsk, Vladivostok (kept open by icebreakers), Odessa, Sevastopol, Novorossik, Batumi; cap. Moscow; a. 8,708,070 sq. m.; p. (1966) *233,000,000*.

Union City, *t.*, N.J., U.S.A.; p. (1960) *52,180*.

United Arab Republic (Egypt), *ind. sovereign st.*, since Feb. 1958; desert, except fertile Nile valley; agr. depends on annual rise of the Nile waters and irrigation (Aswan High Dam); climate: hot, dry summers, warm winters with little rain; agr.: wheat, barley, rice, onions, cotton; phosphates; communications: Nile rly., several surfaced roads across desert; oil offshore 11 m. W. of El Tor, and at Ras Amir. Moslem; cap. Cairo; chief spt. Alexandria; a. 386,100 sq. m.; p. (1961) *26,059,000*.

United Arab States, Federation of United Arab Republic and Yemen.

United Kingdom, *cty.*, N.W. Europe; separated from continent of Europe by Eng. Channel; consists of Gr. Britain (Eng., Wales, Scot.) and N. Ireland. *See under separate headings.*

United Provinces, India. *See* **Uttar Pradesh.**

United States, *federal rep.*, N. America; ch. physical features: Great Ls., lgst. freshwater a. in the world; ch. Rs.: Mississippi–Missouri, Rio Grande del Norte, Colorado, Hudson, Susquehanna, Savannah, Columbia; ch. mtns.; Rocky Mtns., Coast Range, Sierra Nevada, Appalachian Mtns.; Great Basin, great plains, Piedmont plateau, coastal plains; climate in N.E.—cool, temperate, rainfall all year round, warm summers, cold winters; in central plains and Gr. Basin—continental climate of extremes; in N.W.—cool temperate with abundant rainfall warm summers, cold winters; in S.W. on Pacific cst.—Mediterranean climate of very warm summers and drought, mild winters with rainfall, dense fogs off Pacific cst.; in S. and S.E. sub-tropical, hot summers, mild winters with abundant rainfall in the S.E. decreasing towards the W.; ch. inds.; agr., maize, wheat, oats, etc., fruit, potatoes, hay, alfalfa, cane- and beet-sugar, cotton, tobacco; pastoral farming, ranching, dairying, sheep, wool, cattle, pigs, horses; lumbering, timber, wood-pulp; fishing off Grand Bank, Newfoundland, for cod, etc., and in W for salmon; minerals: coal, petroleum, natural gas, phosphate, iron ore, copper, lead, gold, silver, zinc, aluminium, mercury; mftg. of all kinds; commerce; comprises 50 sts. and Dist. of Columbia; cap. Washington; lgst. ts. New York, Chicago, Los Angeles, Philadelphia; total a. (inc. possessions) *3,608,787* sq. m.; p. (1966) *196,600,000*.

University City, *t.*, Mo., U.S.A.; p. (1960) *51,249*.

Unna, *t.*, N. Rhine–Westphalia, Germany; coal-mng., machin., iron; p. (1963) *31,000*.

Unst, *I.*, Shetlands; most N. of gr.; length 12½ m.

Unstrut, *R.*, Saxony, Germany; trib. of R. Saale, length 110 m.

Untersee, W. portion of L. of Constance.

Unterwalden, *old can.*, Switzerland; now subdivided into Obwalden and Nidwalden; dairying, fruit and livestock; ch. ts. are Sarnen and Stans.

Unter-Yberg, *vil.*, Switzerland; medicinal springs.

Upholland, *t.*, *urb. dist.*, Lancs, Eng.; 4 m. W. of Wigan; bricks; p. (1961) *7,451*.

Upper Austria, *prov.*, Austria; cap. Linz; a. 4,625 sq. m.; p. (1961) *1,131,623*.

Upper Nile, *prov.*, Sudan, N.E. Africa; cap. Malakal; a. 92,270 sq. m.; p. (estd. 1951) *852,200*.

Upper Seal Lake, Labrador, Newfoundland, Canada.

Upper Volta, see **Voltaic Republic.**

Uppingham, *mkt. t.*, *rural dist.*, Rutland, Eng.; 4 m. S. of Oakham; p. (rural dist. 1961) *5,340*.

Uppsala, *co.*, E. Sweden: N. of L. Mälar; cap. Uppsala; a. 2,056 sq. m.; p. (1961) *167,735*.

Uppsala, *t.*, cap. Uppsala, Sweden; on R. Sala; 45 m. from Stockholm; univ., cath.; lt. inds.; p. (1961) *77,518*.

Ur, *ancient* Chaldean *c.* Iraq; 130 m. W.N.W. of Basra; ruins; flourished about 3,000 B.C.

Ural Mtns., R.S.F.S.R.; mtns. separating Asia from Europe; 2,050 m. long; highest summit, Tolposis Mtn., 5,430 ft.

Ural, *R.*, R.S.F.S.R.; flows S.W. and S. to the Caspian Sea; length 1,500 m.

Uralsk, *t.*, Kazakh S.S.R.; on R. Ural; grain-trading and cattle-mart. ctr.; flour, leather, woollens, iron-ware; p. (1959) *105,000*

Uranium City, N. Saskatchewan, Canada; nr. N. shore of L. Athabasca, ctr. of Beaverlodge uranium-mining a.; founded 1951; p. (1953) approx. *500*.

Urbana, *c.*, Ill., U.S.A.; on Embarrass R.; seat of st. univ.; p. (1960) *27,294*.

Urbino, *t.*, N. Marche, Italy; cath., univ.; silk, cheese, olive oil; p. *20,375*.

Ure, *R.*, N.R. Yorks., Eng.; flows E. and S.E. to the Swale to form the Ouse; length 50 m.
Urfa, *t.*, Turkey; nr. Syrian border; gd. local tr.; p. (1965) *72,873.*
Urga, *see* Ulan Bator.
Uri, *can.*, Switzerland; S. of L. of Lucerne; forest and mtn.; traversed by St. Gotthard Rly. and R. Reuss; cap. Altdorf; a. 415 sq. m.; p. (1961) *32,021.*
Urmia (Rizaieh), *t.*, Azerbaijan, Iran; birthplace of Zoroaster; p. *64,000.*
Urmia, L. of, nr. Tabriz, N.W. Iran; 85 m. by 30 m.; salt and shallow.
Urmston, *urb. dist.*, Lancs, Eng.; p. (1961) *42,983.*
Urubamba, *R.*, Peru, S. America; rises in E. Cordillera of Andes; forms one of head streams of R. Amazon; length 350 m.
Uruguaiana, *t.* Brazil; on R. Uruguay; cattle ctr.; jerked beef, soap, candles; p. (1960) *48,358.*
Uruguay, *rep.*, S. America; climate, temperate; moderate rainfall; vegetation temperate and sub-tropical grasslands; language, Spanish; religion, R. C.; cattle- and sheep-rearing, wheat, olives, grapes, gold, textiles; cap. Montevideo; a. 72,153 sq. m.; p. (1965) *2,682,000.*
Uruguay, *R.*, S. America; rises n S. Brazil, and flows between Argentina and Brazil and Uruguay to Río de la Plata; length 850 m.
Urumchi (Wulumuchi), *c.*, Sinkiang, China; p. (1953) *141,000*
Urup, *I.*, Kurile gr., Pac. Oc.; 50 m. long; 12 m. wide.
Usa, *R.*, U.S.S R.; flows E. from the Urals to the Pechora; length 220 m.
Usak, *t.*, Turkey; connected by rail with Izmir; noted for pile carpet-weaving; p. (1965) *38,815.*
Usedom (Uznam), *I.*, Baltic Sea; off mouth of R. Oder; since 1945 the E. part belongs to Poland, the W. (the larger part) to Germany; I. is 30 m. long and 14 m. wide.
Ushant, *I.*, off cst. of Finisterre, France; at entrance to Eng. Channel; it was off Ushant that Lord Howe gained his great naval victory on the "glorious first of June," 1794.
Ushuaia, *t.*, Argentina; most southerly t. in world; sheep farming, timber, furs; freezing plant; p. *2,500.*
Usk, *R.*, S. Wales and Monmouth, Eng.; flows S. to Bristol Channel; length 57 m.
Uskudar (Scutari), *t.*, Turkey; on the Bosporus, opposite Istanbul; silks, cottons, muslin; p. (estd. 1960) *85,000.*
Uspallata Pass, Andes, Argentina; used by the Mendoza–Valparaiso Transandine rly.
Ussuriysk (Voroshilov), *t.*, R.S.F.S.R.; 70 m. N. of Vladivostok; rly. junction; soya oil, sugar; p. (1959) *104,000.*
Ust Kamenogorsk, *t.*, Kazakhstan, U.S.S.R.; lead refining; hydro-elec. power sta. nearby on R. Irtish; p. (1959) *117,000.*
Ustica, *I.*, Italy; hilly; fruit, olives, grain, osiers; fishing; a. 3 sq. m.
Usti Nad Labem, *t.*, ČSSR.; on the Elbe; chemicals, coal; p. (1962) *63,819.*
Usumacinta, *R.*, Mexico and Guatemala, Central America; trib. of R. Tabasco; length 400 m.
Usumbura, *t.*, Burundi, Africa; cotton ginnery, soapwks.; exp. cotton, coffee, hides; p. (estd. 1949) *17,188.*
Ussuri, *R.*, N. China; flows to R. Amur; length 340 m.
Utah, *W. st.*, U.S.A.; farming, wheat, maize, barley, rye, livestock, sugar-beet, fruits; copper, silver, lead, gold, coal, uranium, vanadium; petroleum; fruit-canning; cap. Salt Lake City; a. 84,916 sq. m.; p. (1960) *890,627.*
Utah, *L.*, U.S A.; 23 m. long and 4,400 ft. above sea-level, discharges by R. Jordan to the Gr. Salt L.
Utica, *c.*, N.Y., U.S.A.; on Mohawk R.; clothing and other mnfs.; p. (1960) *100,410.*
Utiel, *t.*, Spain; W. of Valencia; brandies, wines p. (1957) *13,365.*
Utrecht, *prov.*, Neth.; between Gelderland and N. and S. Holland; fertile agr., cattle rearing, horticulture; a. 526 sq. m.; p. (1967) *758,007.*
Utrecht, *c.*, Neth.; on Old R. Rhine; univ., cath.; chemical and cigar factories; printing, machin., woollens, silks, velvets; p. (1967) *274,485.*
Utrera, *t.*, Spain; S.E. of Seville; industl.; p. (1957) *34,393.*
Uttar Pradesh, *st.*, India; Himalayas on N. bdy., drained by Ganges and Jumna; splendid irrigation; wheat, rice, millet, barley, maize, cotton, sugar, oil-seeds; ch. ts. Allahabad, Lucknow (cap.), Varanasi, Cawnpore, Agra, Meerut; a 113,410 sq. m.; p. (1961) *73,746,401.*
Uttoxeter, *t.*, *urb. dist.*, Staffs, Eng.; on R. Dove, 10 m. N.W of Burton-on-Trent; machin., biscuit mftg.; p. (1961) *8,168.*
Uusimaa, *dep.*, Finland; a. 4,435 sq. m.; cap. Helsinki; p. (1961) *832,936.*
Uvira, *pt.*, Congo, Central Africa; on N.W. cst. of L. Tanganyika; exp. coffee, cotton, hides; bricks, cotton ginning.
Uxbridge, *mkt. t.*, *former mun. bor.*; Middx. Eng.; on R. Colne; now inc. in Hillingdon outer bor., Greater London; residtl.; light inds., film studio; p. (1961) *63,941.*
Uzbekistan, *constituent rep.*, U.S.S.R.; intensive farming based on irrigation; rice, cotton, fruits, silk, cattle, sheep; cap. Tashkent; alluvial gold deposits and bauxite in Kyzyl-Kum desert; a. 159,170 sq. m.; p. (1959) *8,113,000.*
Uzen, (Gr. and Little), *Rs.*, U.S.S.R., flowing 250 m. to the Caspian Sea.
Uzgen, *region*, Kirghiz, S.S.R., U.S.S.R.; coal cotton, engin.
Uzhgorod, *t.*, Ukrainian S.S.R.; univ.; wood-workings, food inds.; engin.; p. (1959) *47,000.*
Uzhoi Cape, *promontory*, on Ob. Bay, N. Siberia, U.S.S.R.
Uzlovaya, *t.*, R.S.F.S.R.; 30 m. S.E. of Tula; coal mng.; impt. rly. junction; p. (1959) *54,000.*

Vaal, *R.*, S. Africa; rises in Drakensberg Mtns., and flows between the Transvaal and Orange Free State to join the Orange R. nr. Kimberley; length 560 m.
Vaasa (Vasa), *dep.*, Finland; cap. Vaasa; p. (1961) *443,505.*
Vaasa, *t.*, *pt.*, *cap.*, Vaasa Finland; on G. of Bothnia; oats, butter, cattle exp.; p. (1961) *43,721.*
Vác, *t.*, Hungary; on R. Danube; chemicals, surveying instruments; p. (1962) *26,679.*
Vaduz, *t.*, *cap.*, Liechtenstein; p. (1960) *3,398.*
Váh, *R.*, Czechoslovakia; trib. of R. Danube; length 200 m.
Val de Chiana, *see* Chiana, Val de.
Valais, *can.*, Switzerland; comprising upper valley of R Rhône; surrounded by high mtns.; cap. Sion; a. 2,021 sq. m.; p. (1961) *177,783.*
Valdai Hills, U.S.S.R.; N.W. of Moscow; highest summit 1,100 ft.
Valdecañas, Spain, 120 m. S.W. Madrid; dam and power sta.
Valdepeñas, *t.*, Central Spain; mineral springs, wine; p. *26,000*
Valdivia, *prov.*, S. Chile; cap. Valdivia; a. 7,721 sq. m.; p. (1960) *302,779.*
Valdivia, *t.*, cap. Valdivia, S. Chile; on R. Calle-calle nr. the sea (pt. Corral); damaged by earthquake and tidal wave, May 1960; univ.; metal, wood and leather goods; paper, flour, brewing; p. (1961) *85,000.*
Valdosta, *t.*, Ga., U.S.A.; rly. ctr., cotton mills, light engin.; p. (1960) *30,652.*

Virginia Water, *artificial L.*, nr. Windsor, Berks,

Virgin Is. (Brit.), part of Leeward Is. gr., W. Indies, a. 59 sq. m.; lgst. I. Tortola; fruit, vegetables, charcoal, rum, sugar, tobacco; p. (estd. 1965) *8,500*.

Virgin Isles (U.S.A.), gr. in the W. Indies; E. of Puerto Rico; purchased by U.S.A. from Denmark 1917, comprising the Is. of St. Croix, St. Thomas and St. John, and about 50 sm. Is.; total a. 133 sq. m.; oil refinery projected at St. Croix, p. (1950) *26,665*.

Visby, *old spt.*, Sweden; on Gotland I. in Baltic Sea; rich in historic interest; Gothic churches; resort; p. (1961) *15,604*.

Viscaya, *Basque prov.*, Spain; on Bay of Biscay; mineral inds., shipping, etc.; cap. Bilbao; a. 836 sq. m.; p. (1959) *722,030*.

Vistula, *R.*, Poland; rising in Silesia, and flowing past Krakow and through Poland to the Baltic nr. Gdańsk; navigable from Krakow to the sea; length 693 m.

Vitebsk, *t.*, Byelorussian S.S.R.; on R. Dvina, 354 m. W. of Moscow; textile, machin. tools, food inds.; rly. junction; p. (1959) *148,000*.

Viterbo, *c.*, Italy; N. of Rome; alum mines, matches; p. (1961) *49,543*.

Vitim, *R.*, E. Siberia, R.S.F.S.R.; flows to R. Lena; length 900 m.

Vitória, *spt.*, Brazil; exp. coffee, cocoa, fruit, iron ore; sugar refining, boots, shoes, textiles, cement; p. (1960) *85,242*.

Vitoria, *cap.*, Alava, Spain; wine, hardware, mules, horses; p. (1959) *60,148*.

Vittoria. *t.*, Sicily, Italy; silk mftg.; p. *38,628*.

Vittorio Veneto, *t.*, Italy; N. of Venice; resort; mineral springs; silk; p. *24,234*.

Vizagapatam, *impt. spt.*, E. cst. India; Andhra Prad.; exp. manganese and other mineral ores, tobacco, oil-seed, myrabalams and coir; sm. shipyard; oil-refining; fertilisers; p. (1961) *182,004*.

Vizcaino Bay, Lower Cal., Mexico.

Vizcaya, *prov.*, N. Spain; cap. Bilbao; a. 836 sq. m.; p. (1950) *569,188*.

Vizeu, *dist.*, Portugal; cap. Vizeu; a. 1,955 sq. m.; p. (1960) *498,292*. [*76,808*.

Vizianagram, *t.*, Andhra Prad., India; p. (1961)

Vlaardingen, *fishing t.*, S. Holland, Neth.; on R. Nieuwe Maas; p. (1967) *74,582*.

Vladimir, *c.*, R.S.F.S.R.; between Gorki and Moscow; cath.; farm produce, fruit, tobacco, engin., chemicals; p. (1959) *154,000*.

Vladivostok, *t.*, *ch. spt.*, Siberia, U.S.S.R.; univ., H.Q. Army of the Far East; terminus of the Trans-Siberian rly. and airline from Moscow; oil-refining; p. (1962) *325,000*. [Neth.

Vlieland, *Friesian I.*, at entrance to IJsselmeer,

Vlissingen, *spt.*, *wat. pl.*; Walcheren I., Zeeland, Neth.; summer resort, fishing and shipbldg. ctr.; p. (1967) *38,564*.

Vlonë, *spt.*, Albania; on Strait of Otranto, Adriatic Sea; salt; oil pipe-line connects from Kuçovë; p. (1960) *33,000*.

Vltava, *R.*, Bohemia, Czechoslovakia; flows to R. Elbe, below Prague; length 262 m.

Voghera, *t.*, Italy; silks; p. *39,422*.

Voi, *t.*, *impt. rly. junction*, Kenya, E. Africa; 90 m. N.W. of Mombasa on rly. to Nairobi; branch connection with Tanzania rly. system allows agr. produce from Arusha and Moshi dists. to pass through Mombasa as alternative to Tanga.

Voiron, *t.*, Isère, France; on R. Isère nr. Grenoble; p. (1954) *13,551*.

Volga, *R.*, U.S.S.R.; rises on Vladai plateau, flows in a serpentine course to the Caspian at Astrakhan; frozen in winter; 2,325 m. long.

Volga Baltic Waterway (Mariinsk Waterway), R.S.F.S.R.; inland deep water navigation network linking Black Sea and Caspian Sea in S. with Baltic Sea and White Sea in N.

Volgograd (former Stalingrad), *c.*, R.S.F.S.R.; on R. Volga, S. of Saratov; steel, engin., chemicals, oil-refining, hydro-elec. sta.; fierce siege and successful defence Sept. to Nov. 1942 turning point of the last war; p. (1962) *649,000*.

Volhynia, *dist.*, part of Ukraine S.S.R., U.S.S.R.; on Polish frontier (Polish 1919–39); a. 13,750 sq. m.; now prov. of Lutsk and Rovno.

Volkhov, *R.*, R.S.F.S.R.; flows from L. Ilmen to L. Ladoga; length 130 m.

Völklingen, *t.*, Saarland; on R. Saar; coal-mining, metallurgy; p. (1963) *42,900*.

Volksrust, *t.*, Transvaal, S. Africa; dairying; rly. wkshps.; p. (1960) *8,096* inc. *3,776* Europeans.

Vologda, *t.*, R.S.F.S.R., U.S.S.R.; engin., textiles, sawmilling; p. (1959) *138,000*. [(1951) *51,134*.

Vólos, *spt.*, Greece; at head of G. of Vólos; p.

Volpiano, nr. Turin, Italy; oil refinery under construction; pipeline to Geneva projected.

Volsk, *t.*, R.S.F.S.R.; on R. Volga; gd. tr.; iron-wks., tanneries, milling; p. (1959) *62,000*.

Volta Redonda, Rio de Janeiro, Brazil; steel plants; p. (1960) *83,973*.

Volta (White Volta), *R.*, drains extensive terr. in Niger Bend, flows S. through Ghana to delta on Guinea cst. 70 m. E. of Accra; forms main means of communication; rapids make through navigation impossible; length 950 m. Volta R. project for industrialisation of Ghana: dam and power plant at Akosombo, aluminium smelter at Tema. *See also* **Black Volta.**

Voltaic Republic (former Upper Volta), *ind. sov. st.*, W. Africa; cap. Ouagadougou; a. 122,000 sq. m.; p. (1961) *3,635,000*.

Volterra, *hill t.*, Tuscany, Italy; Etruscan and mediaeval walls; alabaster; p. *19,054*. [*10,000*.

Voltri, *t.*, Italy; shrine, shipbldg., ironwks.; p.

Volzhskiy, *t.*, R.S.F.S.R.; new town 10 m. E. of Volgograd; p. (1959) *67,000*.

Vorarlberg, *prov.*, Austria; cap. Bregenz (*q.v.*); a. 1,004 sq. m.; p. (1961) *226,323*. [*11,780*.

Vordingborg, S., *t.*, Zealand, Denmark; p. (1960)

Vorkuta, *dist.*, Siberia, R.S.F.S.R.; about 120 m. W. of mouth of R. Ob; new coal-mining ctr. which supplies entire European north U.S.S.R.; p. of Vorkuta t. (1959) *55,000*.

Voronezh, *region*, R.S.F.S.R., U.S.S.R.; agr.

stock-rearing, woodwork and domestic mnfs.; cap. Voronezh.
Voronezh, *t.*, R.S.F.S.R., U.S.S.R.: on R. Voronezh nr. its junction with R. Don; univ.; impt. comm. ctr.; synthetic rubber, engin.; p. (1962) *516,000*.
Voroshilovgrad *see* **Lugansk.**
Voroshilovsk, *t.*, Ukrainian S.S.R.; 25 m. S.W. of Lugansk; ctr. of iron, steel and coking inds.; p. (1956) *98,000*.
Vosges, *mtn. chain*, E. France; 190 m. long; highest summit, the Ballon de Guebwiller (4,672 ft.).
Vosges, *E. frontier dep.*, France; agr., dairying, vineyards, textiles, coal, stone; cap. Epinal; a. 2,305 sq. m.; p. (1962) *380,676*.
Voskresensk, *t.*, R.S.F.S.R.; S.E. Moscow; lignite, chemicals, fertilisers; p. (1954) *50,000*.
Votkinsk, *t.*, R.S.F.S.R.; 38 m. N.E. of Izhevsk; lge. engin. plant; p. (1959) *59,000*.
Voyusa, *R.*, rises in Greece, flows N.W. through Albania into Strait of Otranto.
Vranja, *t.*, Jugoslavia; flax and hemp culture and mnf.; nr. is health resort of Vranyskas Banya; p. (1956) *15,000*.
Vratca, *t.*, Bulgaria; on R. Vratcanska; jewellery, wine, silk, tanning; p. (1956) *26,582*.
Vrede, *t.*, O.F.S., S. Africa; agr ctr; horse-breeding; p. (1960) *6,770* (inc. *2,106* whites).
Vrsac, *t.*, Jugoslavia; milling, wine, brandy; p. (1959) *30,000*.
Vryburg, *t.*, Cape Province, S. Africa; gold field in a.; stock-raising; p. (1960) *14,597* (inc. *4 809* whites).
Vryheid, *t.*, Natal, S. Africa; coal, iron, copper, gold, silver, lead mines; p. (1960) *10,783* (inc. *4,920* whites).
Vulcan Pass, in the Carpathian Mtns., between Romania and Transylvania.
Vulcano, *I.*, Lipari gr., Tyrrhenian Sea; located 12 m. off N.E. cst., Sicily; active volcano; gave its name as generic title for this type of mtn.
Vychegda, *R.*, Komi A.S.S.R., R.S.F.S.R.; flows W. to N. Dvina R.; length 700 m.
Vyrnwy, *L.*, *artificial reservoir*, Montgomery, Wales; with a dam 1,180 ft. long furnishing water for Liverpool; 5 m. long; a. 1,121 acres
Vyshni-Volochek, *t.*, R.S.F.S.R., U.S.S.R.; 74 m. N.W. of Kalinin; flour-milling, textiles, glass inds.; p. (1959) *66,000*.

Zhdanov (Mariupol), *spt.*, Ukrainian S.S.R.; on Azov Sea; iron and steel, zirconium, chemicals; p. (1962) *321,000*.

Zhitomir, *t.*, Ukrainian S.S.R.; engin.; p. (1959) *105,000*.

Zielona Gora (Grünberg), *t.*, Silesia, Poland; German before 1945; lignite mining, viticulture; p. (1965) *62,000*.

Zile, *t.*, Turkey; cereals, fruit, wool, rugs; p. (1965) *26,152*.

Zillertal, *valley*, Tyrol, Austria; drained by R. Ziller, trib. of R. Inn; length 50 m.

Zillertal Alps, *mtns.*, Austria; in Tyrol.

Zinder, *t.*, Niger, W. Africa; terminus of trans-Saharan motor route; tr. ctr.

Zipaquira, *t.*, Colombia; 30 m. N. of Bogota; cattle farming; salt mines; p. (estd. 1959) *29,880*.

Zistersdorf, *t.*, N.E. Austria; recently developed oilfields.

Zittau, *t.*, Dresden, E. Germany; on R. Mandau; woollens, linens, machin., cars, chemicals; p. (1963) *42,863*.

Žižkov, *t.*, ČSSR.; sub. of Prague; p. *91,082*.

Zlatoust, *t.*, R.S.F.S.R.; in the Ural Mtns.; steel, chemicals, sawmilling; p. (1959) *161,000*.

Zlin, *see* **Gottwaldov**.

Znojmo or Znaim, *t.*, ČSSR.; pottery, textiles, mkt. gardening; p. (1961) *23,956*.

Zomba, *t.*, Malawi, 2,900 ft. above sea level on slopes of Zomba mtn., 42 m. N.E. Blantyre; univ.; p. *7,800* (incl. *800* Europeans).

Zonguldak, *t.*, Turkey; p. (1965) *60,865*.

Zorita De Los Canos, Guadalajara, Spain; on R. Tagus; nuclear power plant under construction.

Zorritos, *t.*, Tumbes dep., Peru, S. America; on cst., 10 m. from Ecuador bdy.; oilfield.

Zoutpansberg, *dist.*, N.E. Transvaal S. Africa; goldfields, mtns.

Zrenjanin (Veliki Bečkerek), *t.*, Vojvodina, Jugoslavia; on R. Begej; flour, leather, timber, sugar, wine, paper, agr., machin.; p. (1960) *52,100*.

Zug, *can.*, Switzerland; cap. Zug; a. 93 sq. m.; p. (1961) *52,489*.

Zugspitze, *mtn.*, Bavarian Alps, highest peak in Germany, 9,722 ft.

Zuider Zee, *see* **Ijselmeer**.

Zulia, *st.*, Venezuela, S. America; cap. Maracaibo; p. (1963) *1,044,000*.

Zululand, *prov.*, Natal; livestock, cereals, fruit, sugar, coffee, tea, gold, coal; a. 10,427 sq. m.

Zungeru, *t.*, Nigeria, Africa; on Lagos–Kano rly.

Zurich, *can.*, Switzerland; cottons, silks; a. 668 sq. m.; p. (1961) *952,304*.

Zurich (Zürich), *c.*, Switzerland; on L. Zurich and R. Limmat, lgst. t.; cap. of Z. prov.; cath., univ.; paper, silks, cottons, machin.; p. (1961) *439,600*.

Zutphen, *c.*, Gelderland, Neth.; on R. IJssel; paper, tanning, engin.; p. (1967) *27,017*.

Zwartebergen, *mtns.*, Cape Province, Rep. of S. Africa; extending 200 m. E. to W. flanked by Gr. Karroo to N. Little Karroo to S.; form impenetrable barrier except where broken across by headstreams of R. Gouritz; rise to over 7,000 ft.

Zwartsluis, *t.*, Neth.; nr. Zwolle; p. *3,348*.

Zweibrücken, *t.*, Rhineland-Palatinate, Germany; nr. Saarbrücken; cas.; machin., footwear, textiles; p. (1963) *33,300*.

Zwickau, *t.*, Karl-Marx-Stadt, E. Germany; on R. Zwickhauser Mulde; cas.; coal, motors, machin., textiles; p. (1963) *129,389*.

Zwolle, *c.*, Overijssel, Neth.; canal ctr.; cattle mkt., cottons, ironwks.; p. (1967) *59,877*.

Zyrardow, *t.*, Poland; nr. Warsaw; mnfs.; p. (1965) *31,000*.

Zyryanovsk, *t.*, Kazakhstan S.S.R.; lead, zinc; p. (1959) *54,000*.

THE BRITISH COMMONWEALTH

The British Commonwealth is a free association of independent member nations together with their dependencies at various stages of political advance. Member nations include Britain, Canada, Australia, New Zealand whose membership of the Commonwealth dates from the Statute of Westminster, 1931, India (1947), Pakistan (1947), Ceylon (1948), Ghana (1957), the Federation of Malaya (1957), which in 1963 became Malaysia, the Federation (now the Federal Republic) of Nigeria (1960), Cyprus (1961), Sierra Leone (1961), Tanganyika (1961), which in 1964 united with Zanzibar (1963) to become Tanzania, Jamaica (1962), Trinidad and Tobago (1962), Uganda (1962), Kenya (1963), Malawi (1964), Malta (1964), Zambia (1964), the Gambia (1965), Singapore, which seceded from the Malaysian Federation (1965), Botswana (1966), Guyana (1966), Lesotho (1966), Barbados (1966) and Mauritius (1968). *See also* Section C, Part II.

I.—MEMBERS OF THE COMMONWEALTH

(including territories for which members other than the U.K. are responsible).

Country	Land Area (sq. miles)	Recent Population Estimates
United Kingdom	94,209	51,985 000
Canada (incl. Newfoundland and Labrador)	3,851,809	18,928,000
Australia (Commonwealth of)	2,974,581	11,250,708
Cocos Islands	5	607
Christmas Island	55	3,099
Norfolk Island—*Colony*	13½	1,048
Papua—*Colony*	90,540	523,000
New Guinea—*Trusteeship*	93,000	1,449,000
Antarctic territory	2,333,624	
New Zealand	103,736	2,414,064
Island Territories (Cook Is. self-gov. st.)	194	24,121
Ross Dependency	160,000 (estimated)	198
India (Republic of)	1,178,995	498,000,000
Pakistan (Republic of)	365,529	93,831,982
Ceylon	25,332	9,404,000
Ghana (Republic of)	91,843	6,691,000
Nigeria (Federal Republic of)	356,669	35,752,000
*Cyprus (Republic of)	3,572	577,639
Sierra Leone	27,925	2,183,000
Tanzania (United Republic of)	363,708	9,710,000
Uganda	93,981	6,845,000
Jamaica	4,411	1,638,000
Trinidad and Tobago	1,980	850,000
Kenya (Republic of)	224,960	8,676,000
Malaysia (Federation of)	127,298	8,416,345
Malawi (Republic of)	45,747	3,000,000
Malta and Gozo	122	329,000
Zambia (Republic of)	288,130	3,500,000
Gambia	4,003	315,990
Singapore (Republic of)	291	1,550,000
Botswana (Republic of)	222,000	548,000
Guyana	83,000	650,000
Lesotho	11,716	733,000
Barbados	166	245,000
Mauritius	720	780,000

* The United Kingdom retains sovereignty over areas totalling about 99 sq. m.

The West Indian Associated States (Antigua, St. Kitts-Nevis-Anguilla, Dominica, St. Lucia, St. Vincent and Grenada) enjoy a special relationship with Britain. They are fully self-governing but Britain retains general responsibility for their defence and external relations. This relationship can be terminated either by the island territory concerned or by the British Government.

II.—TERRITORIES FOR WHICH THE U.K. IS RESPONSIBLE AND WHICH ARE ADMINISTERED THROUGH THE COMMONWEALTH OFFICE.

(Some of the very small, or practically uninhabited, islands have been omitted.)

Region and Territory	Status	Land Area (sq. miles)	Recent Population Estimates
Central Africa:			
Rhodesia	Colony (self-gov.)	150,333	4,210,000
South Africa:			
*Swaziland	Protectorate (self-gov.)	6,704	285,000
Far East:			
Brunei	Protected state (self-gov.)	2,226	97,000
Hong Kong	Colony	398	3,692,000
Mediterranean:			
Gibraltar	Colony	2¼	24,386
Caribbean:			
Montserrat	Colony	32	13,000
Cayman Is.	Colony	100	8,853
British Honduras	Colony (intern. self-gov.)	8,866	103,000
Virgin Islands	Colony	59	8,500
Western Pacific:			
Fiji	Colony	7,095	449,000
Pitcairn	Colony	2	186
Tonga	Protected State	270	71,000
Western Pacific High Commission Territories:			
British Solomon Islands Protectorate	Protectorate	11,500	137,000
Gilbert and Ellice Islands Colony	Colony	369	50,000
New Hebrides	Anglo-French Condominium	5,700	66,000
Atlantic Ocean:			
Falkland Islands	Colony	4,700	2,117
Dependencies:			
S. Georgia	Dependency of Falkland Islands	1,450	521
S. Sandwich Is.	Dependency of Falkland Islands		Uninhabited
British Antarctic Territory:			
S. Shetlands, S. Orkneys, Graham's Land	Colony	500,000	No permanent inhabitants
Bahamas	Colony (intern. self-gov.)	4,404	134,000
Turks and Caicos Is.	Colony	166	6,272
Bermuda	Colony	21	48,000
St. Helena	Colony	47	4,526
Ascension	Dependency of St. Helena	34	374
Tristan da Cunha	Dependency of St. Helena	38	270
Indian Ocean:			
Seychelles	Colony	156	46,000
†British Indian Ocean Territory			1,400

Note.—An illegal declaration of independence was declared in Rhodesia on 11 November 1965. *See* Section C, Part II.

* Swaziland was expected to achieve full independence in Sept. 1968.

† This territory consists of the Chagos Archipelago (formerly part of Mauritius) and Aldabra, Farquhar and Desroches Islands (formerly part of Seychelles).

GENERAL INFORMATION

GENERAL INFORMATION

A

Aard-vark (Dutch *aarde* = earth + *vark* = pig), name given by the Boers to a genus of ant-eating mammals peculiar to Africa. They are nocturnal and burrowing, with an arched back, and usually grow to a length of 5 ft.

Abacus, a device for making arithmetical calculations, consisting of parallel bars on which are strung movable coloured beads. The earliest form of this instrument was used in Mesopotamia about 3000 B.C., and its use spread westwards throughout the Græco-Roman world and eastwards to China. An efficient form of the abacus is still used today in parts of Asia.

Abdication. The term usually refers to the renunciation of the royal office by a reigning monarch. Both Edward II (1327) and Richard II (1399) were forced to abdicate, James II left the throne vacant without waiting for a formal deposition, and the abdication of Edward VIII was effected by the Declaration of Abdication Act, 1936. Since 1688 when Parliament declared James II to have abdicated by reason of desertion and subversion of the constitution, no British monarch can abdicate without the consent of Parliament.

Aberration, in astronomy, is the apparent displacement of a star due to the speed of the observer with the earth (see Parallax). In optics (i) spherical aberration, causing blurring of an image, is due to failure of lens to bring light to a single focus, (ii) chromatic aberration, causing coloured fringes to an image, is due to the refractive index of glass being different for light of different colours. For instance, violet light is bent more than red. *See* **F53(2)**.

Abiogenesis, or spontaneous generation: the origination of living from non-living matter. The term is applied to such discredited ideas as that frogs could be generated spontaneously by the action of sunlight on mud, or maggots arise spontaneously in dead meat without any eggs from which the maggots hatch being present. Spallanzani (1729–99) upset the hypothesis of spontaneous generation; Pasteur dealt it a death-blow.

Abominable Snowman. *See* **Yeti.**

Aborigines, a term first applied to an ancient mythical people of central Italy, derives from the Latin *ab origine* = from the beginning. It now signifies the original inhabitants of any country, in particular the aboriginal tribes of Australia. In contrast to their highly complex social and religious customs, the material culture of Australian aborigines is very low and ill adapted to stand up to contact with European civilisation. Originally estimated at 300,000, their number has dropped in the last 200 years to some 40,000. A referendum held in 1967 showed that the majority of Australians wished to give the Aborigines citizen rights and thus end the discrimination against them.

Absolute Temperature, Absolute Zero. This is a refined notion requiring some study of thermodynamics for its full understanding. For setting up an absolute temperature scale one must first assign a numerical value to one fixed temperature. For this, the triple point of water has been chosen, *i.e.*, the temperature at which solid, liquid, and gaseous water are all in equilibrium. The triple point is defined to be 273·16° K where °K is read "degrees Kelvin" (after Lord Kelvin). This temperature is 0·01° C on the Celsius scale (*q.v.*) and is thus very close to the melting point of ice. Suppose the pressure and volume of a mass of gas are measured (i) at the triple point of water, giving $(pV)_{tr}$ as the product of the pressure and volume; and (ii) at any unknown temperature T° K, giving (pV) as the product. Then the absolute temperature, T° K, is defined by

$$T^\circ\text{ K} = 273{\cdot}16\,\frac{(pV)}{(pV)_{tr}}$$

It is to be understood that the gas pressure is very low. The nature of the gas is immaterial. More subtly, it can be shown that the temperature so defined is identical with that derived in a rather abstract way in the science of thermodynamics. The absolute scale is therefore also called the thermodynamic scale. Absolute temperatures can be obtained from Celsius temperatures by adding 273·15; thus the absolute temperature of melting ice is 273·15° K. Conversely, absolute zero is a temperature 273·15° K below the temperature of melting ice, *i.e.*, −273·15° C. In strict theory, absolute zero is not attainable; it has been approached to within about 1 millionth of a degree. Within ten or so degrees of absolute zero, matter develops some remarkable properties. *See* **Cryogenics, Superconductor, Helium.**

Absolution, an ecclesiastical term denoting the liberation of a person guilty of sin from its consequences by the act or intercession of religious authority.

Abstract Art, a term applied to 20th cent. plastic arts in which form and colour possess aesthetic value apart from the subject. Usually represented as a modern movement beginning with Cézanne. The idea is ancient, abstract design being found in the Neolithic period, in folk-art, and particularly in Moslem art (which forbids naturalistic representations especially of the human figure). Among those in the tradition are Kandinsky, Braque, Mondrian, Calder.

Acetic Acid, an organic acid produced when ordinary (ethyl) alcohol is fermented by the organism called *Acetobacter aceti*. The same oxidation process yields vinegar; this is a weak and crude solution of acetic acid obtained by trickling dilute alcoholic liquor over beechwood shavings at 35° C. The souring of wine is due to the same process. Acetic acid is used as a food preservative and flavouring material, and in the manufacture of cellulose acetate and white lead.

Acetylene, a compound of carbon and hydrogen prepared from calcium carbide and water. A very reactive gas, it is used industrially on a large scale to prepare acetaldehyde, chlorohydrocarbon solvents, and many intermediates for plastics manufacture. Burns in air with a highly luminous flame formerly used for lighting purposes, but is now widely used, with oxygen, in welding. For safe storage and transportation it is dissolved in acetone.

Acids, substances having a tendency to lose a positive ion (a proton). This general definition overcomes difficulties of earlier views which merely described their properties and asserted that they are chemically opposite to bases. As a whole acids contain ionisable hydrogen, replaceable by a metal, to form a salt. Inorganic acids are compounds of non-metals or metalloids, *e.g.*, sulphuric, phosphoric acid. Carboxylic acids contain the group –COOH.

Acolyte, one who assists the priest at Mass by saying the responses and by waiting on him.

Act of God, a natural catastrophe that could not be foreseen or averted.

Advent, a period devoted to religious preparation for the coming celebration of the Nativity (Christmas). It comprises four Sundays, and commences on the one nearest to St. Andrew's Day (Nov. 30). Advent was not observed before the 4th cent.

Advocatus Diaboli ("the devil's advocate"), a Roman Catholic functionary who presents opposing evidence in regard to the life of any deceased person it may be proposed to canonise.

Aeolian Harp, a musical instrument once very popular. It consists of catgut stretched over a wooden sound-box which, when placed out of doors in the wind, can be made to emit many pleasing harmonies.

Aerenchyma. Plant tissue which is spongy because there are large air spaces between the cells in which gases can circulate. This aerating tissue is characteristic of marsh and water-plants.

Aerodynamics, the science of gases (especially air) in motion, particularly in relation to aircraft (aeronautics). The idea of imitating the birds by the use of wings is of ancient origin. Leonardo da Vinci first carried out experiments in a scientific manner. The invention of the balloon in 1783 and the researches of scientists and engineers in the 19th cent. ultimately led to the development of the aeroplane.

Aerolites, the name given to the class of meteorites composed chiefly of heavy silicates. The other two main classes are *siderolites* (nickel–iron and silicates) and *siderites* (nickel–iron).

Aerosol, a suspension of a liquid in a gas; for example, a fog is very small drops of water suspended in air. Formed by spraying the liquid in air, aerosols are used to disperse liquids over a wide area in crop spraying, air freshening, and pest control.

Afrikander, type of cattle bred in South Africa.

Afrikaner, an Afrikaans-speaking South African, usually of Dutch descent.

After-damp is a mixture of carbon dioxide and nitrogen that occurs in a mine after an explosion and causes suffocation to human beings. It is also called "choke damp" and "black damp."

Agape, a "love-feast" held by the early Christians in commemoration of the Lord's Supper. *See* J28 (1).

Agar-agar, a vegetable jelly obtained from seaweeds, widely used in jellies, canned meat and poultry, and as a constituent in medicinal and cosmetic preparations. Used by bacteriologists to solidify broth and blood upon which bacteria are cultivated. Chief sources of supply: Far East and California.

Agaric, large fungi of the family *Agaricaceae*, which includes the mushroom and what are popularly called "toadstools," though the idea that these two lay terms sharply differentiate between edible and poisonous fungi is an incorrect one. Characteristic of the agarics is the presence of a cap or *pileus* (bearing underneath the spore-shedding gills) and a stalk or *stipe*.

Agate, a variety of chalcedony. Parallel bands of colour are often characteristic. Germany, Brazil, and India furnish the main supplies, and Scotland has a species of agate called Scotch pebble.

Agave, the American aloe or Century Plant which sometimes does not attain to flowering maturity under sixty or seventy years, and then dies. The flower spray may reach a height of 20 feet and in its development the rush of sap is so great that the Mexicans collect for brewing the strong spirit called mescal. 1,000 litres of sap can be obtained from a single plant. Some species of agave yield sisal used for making cord and rope.

Agnus Dei (Lamb of God), a short anthem said or sung at a certain point of the Roman Catholic Mass or Anglican communion service. (John i. 29.)

Air is a mixture of gases forming the atmosphere we breathe. Nitrogen, oxygen, and argon are always present in air; a typical sample of dry air might contain these gases in the following proportions (by volume): nitrogen, 78·06%; oxygen, 21%; argon, 0·94%. A small quantity of carbon dioxide is present, about 3 parts in 10,000 parts of air. This carbon dioxide is the source of carbon compounds built up by green plants in photosynthesis (F21); in the process carbon dioxide is absorbed from the air and oxygen returned, the reverse of the respiratory process of animals. Air also contains a quantity of water vapour, and traces of ammonia, nitrogen oxides, hydrogen, sulphur dioxide, hydrogen sulphide, ozone and of the rare gases helium, krypton, neon, and xenon. In a city smoke and dust particles may be as abundant as 100,000 particles per cc. A litre of air at 0° C. and 700 mm. pressure weighs 1·2932 grams. *See also* Atmosphere, Pollution.

Alabaster, a soft crystalline form of sulphate of lime, or granulated gypsum, easily worked for statuary and other ornamental articles, and capable of being highly polished. Volterra, in Tuscany, yields the finest; that in highest ancient repute came from Alabastron in Egypt, near to the modern Antinoë.

Alb, white vestment reaching to the feet, worn by priests in religious ceremonies.

Albatross, a large sea-bird of almost pure white, black and white, or brown plumage. It nests in colonies on remote islands, but at other times rarely approaches land. Of the thirteen species, nine are found in the southern oceans, one in the tropics, and the three others in the North Pacific.

Albert Memorial, a large Gothic monument designed by Sir George Gilbert Scott, and embellished with sculptures by eminent artists. Erected in memory of Prince Albert in Kensington Gardens at a cost of £120,000.

Alcázar, the palace at Seville, famed for the beauty of its halls and gardens, in ancient days the residence of the Moorish kings.

Alcohols. A class of organic compounds of general formula R–OH, where R is an aliphatic radical. "Alcohol" is the name used for ethyl alcohol (ethanol); this is produced by distilling fermented liquors, and synthetically from ethylene, a product of petroleum cracking. Industrially ethyl alcohol is used in the manufacture of chloroform, ether, perfumes, etc. Diluted with wood alcohol or other denaturants ethyl alcohol is called "methylated spirits"; the denaturants are varied according to the industrial purposes for which it is required, the methylated spirits then being largely exempt from duty. Wood alcohol (methyl alcohol or methanol) can be obtained by distilling wood, or synthetically from water gas.

Alcoholic Strength. In Great Britain the standard is the proof gallon which is an imperial gallon of spirits containing 49·28 per cent. of alcohol by weight or 57·1 per cent. by volume at 60° F. In Europe the strength of spirits is usually measured by the Guy-Lussac hydrometer. In the U.S.A., because of the smaller gallon, 1·37 U.S. proof gallons = 1 British proof gallon. In Britain the alcoholic content of spirits and liqueurs appears on the bottle in degrees proof. Whisky, for example, at 70° proof (or 30° under proof) contains 70/100 × 57·1 alcohol, or about 40 per cent. The alcoholic content of wines is not shown on the label.

Aldehyde, the generic term for a class of chemical compounds of general formula R–CHO, where R is an organic radical. Except for formaldehyde, which is a gas, aldehydes are volatile liquids. They are produced by oxidation of primary alcohols. Most important aldehyde is formaldehyde used in making the plastics described as formaldehyde resins. Formalin (formaldehyde solution in water) is much used for preserving zoological specimens.

Alder, a river-side tree of the genus *Alnus*, including some 30 species and found in north temperate regions and the Andes. The only species native to Britain is *A. glutinosa*, which has been described as "guardian of river-banks" because of the way its roots bind together the sand and stones, and so slow down erosion. The wood is used for furniture and charcoal.

Aldine Editions are the beautiful books printed in Venice by the Renaissance printer Aldo Pio Manuzio and his family between 1490 and 1597. Italics were first introduced in these books.

Algae, flowerless plants living mostly in water. Seaweeds and the green pond scums are the best known algae. The green powder found on trees is composed of a microscopic alga (*Protococcus*).

Algebra, a branch of mathematics in which symbols are used in place of numbers. Sir Isaac Newton styled it the "universal arithmetic." The Chinese were able to solve the quadratic equation before the Christian era but it was Al-Khowarizmi, an Arab mathematician of the early 9th cent., who introduced algebra to Europe.

Alhambra, the ancient palace of the Moorish kings at Granada in Spain, built in the 13th and 14th cent. Though part of the castle was turned into a modern palace under Charles V., the most beautiful parts of the interior are still preserved—the graceful halls and dwelling-rooms grouped round the Court of Alberca and the Court of Lions, with their fountains, arcades, and lovely gardens.

Aliphatic describes derivatives of hydrocarbons having chains of carbon atoms, as distinct from rings of carbon atoms as in benzene (*see* Aromatic). The gas butane is aliphatic.

Alkali, the general name given to a number of chemicals which are bases (*q.v.*). The term should be limited to the hydroxides of metals

in the first and second group of the periodic table and of ammonia, *e.g.*, NaOH, KOH. They are used commercially in the manufacture of paper, glass, soap, and artificial silk. The word comes from the Arabic *al-kali* meaning calcined wood ashes. Alkalis are extremely soluble in water and neutralise acids to form salts and water.

Alkaloids, a large group of natural products which contain nitrogen; they are usually basic. Isolated from plants and animals, they include some hormones, vitamins, and drugs. Examples are nicotine, adrenalin, and cocaine. Many alkaloids are made synthetically for medicinal use, *e.g.*, morphine, quinine. Their function in plants is not well understood. *See* Belladonna.

Alligator, the crocodile of America, common in the lower Mississippi and adjacent lakes and marshes, varying in length from 2 to 20 feet.

Alloys are combinations of metals. They are made because of their valuable special properties, *e.g.*, durability, strength, lightness, magnetism, rust-resistance, etc. Some well-known ones are brass (zinc + copper), coinage bronze (copper + zinc + tin), steels (iron + carbon + various other materials), soft solder (tin + lead), dental fillings (mercury + various ingredients).

All Saints' Day (Nov. 1) is common to both the English and Roman Catholic Churches, and is in commemoration of the saints generally, or such as have no special day set apart for them. Instituted by Pope Boniface IV., early in the 7th cent., this ecclesiastical festival was formerly called "All Hallows."

All Souls' Day (Nov. 2) is a festival of the Roman Church, intended for the mitigation by prayer of the sufferings of souls in purgatory. The commemoration was enjoined by Abbot Odilo of Cluny during the 11th cent. upon the monastic order over which he presided, and was afterwards adopted generally throughout the Roman Communion.

Allspice, a flavouring obtained from a West Indian tree of the myrtle family, *Pimenta officinalis*. The essential oil of its unripe fruit is a powerful irritant, and the bruised berries are carminative.

Alluvium, accumulations of sand, mud, gravel, etc., washed down by rivers and forming distinct deposits.

Almond, the fruit of the *Amygdalus communis*, originally indigenous to Persia, Asia Minor, and N. Africa; now cultivated in Italy, Spain, France, the U.S.A., and Australia. It yields both bitter and sweet oil. Bitter almond oil is obtained by macerating and distilling the ripe seeds; it is used for flavouring and scenting purposes, its fragrant odour being due to the presence of benzaldehyde and hydrogen cyanide. When the seeds are pressed sweet almond oil results: this is used in perfumery, and also as a lubricant for very delicate machinery.

Almuce, a fur stole worn by certain canons.

Aloe, large plants of the lily family, with about 180 species found mainly in the S. African veldt and Karroo. The bitter purgative drug (aloes) is prepared by evaporating the plant's sap. *See* Agave.

Alpaca, a South American ruminant related to the llama whose long, fine wool is woven into a soft dress fabric known by the same name. Sir Titus Salt first manufactured alpaca cloth (1836). Saltaire, near Bradford, remains to evidence the success which for many years attended the enterprise.

Alpha Particle, or alpha-ray, fast-moving helium nucleus ejected by some radioactive atoms, *e.g.*, polonium. It is a combination of 2 neutrons and 2 protons. *See* F11(1).

Alphabet (so called from the first two letters of the Greek alphabet—alpha, beta) is the term applied to the collection of letters from which the words of a language are made up. It grew out of the knowledge that all words can be expressed by a limited number of sounds arranged in various combinations. The Phoenicians were the first to make use of an alphabetic script derived from an earlier Semitic alphabet (earliest known inscriptions c. 1500–950 B.C.) from which all other alphabets have sprung. The stages in the development of the alphabet were mnemonic (memory aids), pictorial (actual pictures), ideographic (symbols), and lastly phonetic. All the ideographic systems died out, with the exception of that of the Chinese.

Altimeter, an instrument used in aircraft to estimate altitude; its usual essential feature is an aneroid barometer which registers the decrease of pressure with height. Roughly 1 millibar corresponds to 30 ft. To read an aircraft altimeter correct for its destination, the zero setting must be adjusted for difference of ground height and difference of surface pressure, especially when pressure is falling or when flying towards low pressure.

Altitude, an astronomical term used to signify the angular elevation of a heavenly body; this is measured with a quadrant or sextant. In aeronautics it is the height (in feet or metres) above sea-level.

Alto-Relievo, a term applied to sculptured designs which are depicted in prominent relief on a flat surface, technically signifying that the projection exceeds one-half the true proportions of the objects represented. Basso-relievo is carving kept lower than one-half such projection.

Alum is a compound salt used in various industrial processes, especially dyeing, its constituents being the sulphate of one univalent metal or radical (*e.g.*, potassium, sodium, ammonium, rubidium, caesium, silver, thallium) and the sulphate of a tervalent metal (*e.g.*, aluminium, iron, chromium, manganese), and water of crystallisation.

Alumina is the oxide of aluminium. Very valuable as a refractory material. The ruby is almost 100 per cent. alumina; so also are the emerald, oriental amethyst, etc. An hydrated aluminium oxide is bauxite, chief ore of aluminium, from which the metal is extracted electrolytically.

Aluminium is a light metal which conducts electricity well. Its specific gravity at 20° C. is 2·705. Melting point of aluminium is 660·2° C. It is made commercially by electrolysing bauxite dissolved in cryolite (double fluoride of aluminium and sodium). Aluminium alloys because of their strength and lightness are being increasingly used for the construction of railway coaches, automobiles, aeroplanes, etc.

Amadavat, a popular cage bird of the weaver family, mainly crimson with white spots, so named because the first specimens came from Ahmadabad in India about 1700.

Amalgam is the term applied to any alloy of which mercury forms a part.

Amber, a brittle resinous substance; in origin, fossilised resin. Obtained mostly from the Baltic coasts, and used for ornaments, pipe mouth-pieces, etc.

Ambergris is a waxy substance produced in the intestines of the sperm whale, and generally found floating on the sea. It is a valuable perfumery material.

Amblyopsis, a species of fish, practically sightless, and with inoperative organs of hearing and feeling, that inhabit the Mammoth Cave of Kentucky. A remarkable illustration of the failure of senses not brought into use.

America's Cup, a prize trophy first offered in 1851 by the Royal Yacht Squadron and open to yachts of all nations. It was won in the first year by the "America," a New York yacht, and has remained on that side of the ocean ever since, despite attempts to recapture it by Lord Dunraven, Sir Thomas Lipton, Mr. T. O. M. Sopwith, and others. The last attempt by Great Britain was in 1964, when *Sovereign* was beaten by the American *Constellation*. Australia challenged for the first time in 1962 with *Gretel*, and in 1967 with *Dame Pattie*, but unsuccessfully. *See also* U32(2).

Amethyst, the violet variety of quartz, used as a precious stone, containing traces of manganese, titanium, and iron. The finest coloured specimens come from Brazil and the Urals.

Amice, a linen vestment worn about the neck by Roman and many Anglican priests over the alb when officiating at Mass or Holy Eucharist. Formerly worn on the head by priests and pilgrims.

Amines, organic chemicals composed of carbon, hydrogen, and nitrogen. They are derived from ammonia, which they resemble in smell and chemical characteristics. The smell of bad fish is due to the presence of amines. Important industrially as intermediates in a wide variety

of products, for example, the synthesis of dye-stuffs and man-made fibres such as nylon.

Amino acids, organic compounds containing an amine group and an acid group. They are the "building bricks" of proteins (*q.v.*). *See* F20(1), 22.

Ammeter, an instrument for measuring the current flowing in an electric circuit. A contraction of ampere-meter. *See* Ampere.

Ammonia, a colourless gaseous compound comprising three atoms of hydrogen to one of nitrogen. Formerly it was made by heating the horns and hoofs of deer, acquiring the name of spirits of hartshorn. The ammonia of commerce is now procured by coal decomposition in the course of gas-making and by direct synthesis. In the very important Haber process of ammonia production by fixation of atmospheric nitrogen, the nitrogen is made to combine with hydrogen and the ammonia so prepared is converted into nitric acid, ammonium nitrate or ammonium sulphate. The Haber process made Germany self-sufficient in nitrates in the first world war, and was afterwards exploited all over the world.

Ammonites, extinct animals related to the Nautilus. The chambered shell is coiled, usually in a plane spiral, and they are confined to Mesozoic rocks.

Ammonium, the basic radical of ammonium salts. Composed of one atom of nitrogen and four of hydrogen, it behaves chemically like an ion of a monovalent alkali metal. Ammonium chloride is known as "sal ammoniac." "Sal volatile" is ammonium carbonate.

Amnesty, an act of grace by which a ruler or governing power pardons political offenders.

Amorphous, a term used to indicate the absence of crystalline form in any body or substance.

Ampere, unit of electric current in the SI system of units; named after André Marie Ampère, who in the 1820s helped to lay the foundations of modern electromagnetism. Defined as that constant current which, if maintained in two parallel rectilinear conductors of infinite length, of negligible circular cross section, and placed at a distance of one metre apart in a vacuum, would produce between these conductors a force equal to 2×10^{-7} newton per metre length. *See* N13.

Amphibia. *See* F26(2).

Amphioxus *or* **Lancelet**, a primitive chordate occurring in sand-banks around British shores and elsewhere.

Ana, a collection of criticisms, observations, or opinions about a particular person, place or subject. Used as a suffix especially applies to a person's memorable sayings, anecdotes about or publications bearing on, as in *Johnsoniana, Alexandriana, Victoriana*.

Anabolism. *See* Catabolism.

Anarchism. *See* J3.

Anchor, an instrument used for keeping ships stationary. Great improvements have been introduced in recent years, stockless anchors being now chiefly used, consisting of a shank and a loose fluke. Lloyds' rules prescribe the number and weight of anchors which must be carried by merchant ships.

Anchorite is a religious person who retires into solitude to employ himself with holy thoughts. Among the early Christians, anchorites were numerous, but in the Western Church they have been few. Their reputation for wisdom and prescience was high, and kings and rulers in olden days would visit their cells for counsel. An anchorite or "ankret" was in mediæval times a source of fame and profit to the monastic house within which he was voluntarily immured.

Anchovy, a fish of the herring family, distinguished by its large mouth and projecting snout, plentiful in the Mediterranean, and much esteemed when cured.

Ancient Lights are rights of light enjoyed by a property owner over adjoining land. Such a right is obtained either by uninterrupted enjoyment for twenty years, or by written authority, and once legally established cannot be upset, no building being permissible that would seriously interfere with the privilege.

Anemometer, an instrument for measuring the strength of the wind. In the most widely used pattern the rotation, about a vertical axis, of a group of hemispherical or conical cups gives a measure of the total flow of air past the cups, various registering devices being employed. The Dines anemograph provides a continuous record of the variation in both velocity and direction; changes of pressure produced in a horizontal tube, kept pointing into the wind by a vane, cause a float, to which a pen is attached, to rise and fall in sympathy with the gusts and lulls. The recently devised hot-wire anemometer, depending upon the change of electrical resistance experienced by a heated wire when cooled, enables very gentle air currents to be investigated.

Aneroid is the kind of barometer which does not depend upon atmospheric support of a mercury (or other liquid) column. It consists of a metallic box, partially exhausted of air, with a corrugated lid which moves with atmospheric changes. A lever system magnifies the lid movements about 200 times and atmospheric pressure is read from a dial. The construction of the vacuum chamber provides automatic compensation for temperature changes. An aneroid barometer is the basic component of an altimeter.

Angelica, an aromatic plant of the Umbelliferae order, *Angelica officinalis*, valuable as a flavouring and possessing medicinal properties. In olden times supposed to protect against poison.

Angelus, a church bell rung in Roman Catholic countries, at morn, noon, and sunset, to remind the faithful to say their Angelic Salutation.

Angevin Dynasty includes the Plantagenet kings from Henry II. to Richard II. The name was derived from Henry II.'s father, Geoffrey, Count of Anjou.

Angles, a northern tribe originally settled in Schleswig, who with the Saxons and Jutes invaded Britain in the 5th cent.

Angstrom, a unit of wavelength, named after the Swedish physicist A. J. Angstrom (1814–74), equal to one hundred-millionth of a centimetre (10^{-8} cm). It is used to measure wavelengths of light, X-rays, etc.

Aniline, a simple aromatic compound related to benzene and ammonia. It is obtained from coal-tar. The name recalls the fact that it was first prepared by distilling indigo (*anil* is Portuguese for indigo). In 1856 W. H. Perkin (1838–1907) discovered the first aniline or coal-tar dye, mauve, and thus founded the modern dyestuff industry.

Animal Kingdom. *See* F25.

Anise, an umbelliferous plant (*Pimpinella anisum*) found in Egypt and the Levant, and valued for its fruit, aniseed, possessing certain medicinal properties and yielding an aromatic, volatile oil. Also used in cooking. The anise of the Bible is *Anethum graveolens, i.e.*, dill.

Annates were acknowledgments formerly paid to the popes by way of fee or tax in respect of ecclesiastical preferment, and consisted usually of a proportion of the income ("first-fruits") of the office. Introduced ir to England in the 13th cent.; annexed to the Crown under Henry VIII; transferred to a perpetual fund for the benefit of the poorer clergy in 1704. *See* Queen Anne's Bounty.

"Annual Register," a yearly record of political and literary events, founded by Edmund Burke (as editor) in 1759 and Robert Dorsley, the bookseller.

Annunciation, Feast of the (March 25), is a church festival commemorating the message of the incarnation of Christ brought by the angel Gabriel to the Virgin Mary, hence the title Lady Day.

Anointing is the pouring of consecrated oil upon the body as a mark of supreme honour. In England it is restricted chiefly to the ceremony of the monarch's coronation, and the spoon with which the oil is applied forms part of the English regalia. In the Roman Catholic Church anointing represents the sacrament of extreme unction.

Ant. There are about 6,000 species of ants, which belong to the same order (Hymenoptera) as the bees, wasps, and ichneumon flies. They are social in habit, living in communities of varying size and development. There are three basic castes in ants—the females or *queens*, the *males*, and the *workers* (the last-named being neuter), although specialised forms of workers are sometimes found, *e.g.*, the *soldiers* of the

harvesting ants. In the communities of those species of ants which evolved most recently there is a highly complex social life and well-developed division of labour. Some species of these ants make slaves of other species, stealing the cocoons before the adult forms emerge. Many ants "milk" greenflies, which they protect for their honey-like secretion, and most ants' nests contain many "guests," such as beetles and silver fish. Some ants harvest grains of corn, and others, from S. America, live on fungi which they cultivate in underground "mushroom beds."

Antarctic Exploration. In earlier centuries it was thought that a great continent must exist in the southern hemisphere, around the South Pole, to balance the known land masses in the north. Its supposed extent was greatly reduced in the 18th cent., particularly when Capt. Cook sailed for the first time south of the Antarctic Circle and reached the edge of the ice pack. A portion of the ice-covered continent—the coast of Graham Land—was first sighted by Lieut. Edward Bransfield in 1820. Explorers of several other nations sighted portions of the coast-line in other quarters, but the first extensive exploration was made by Capt. James Clarke Ross, who with the *Erebus* and *Terror* penetrated into the Ross Sea in 1841, and discovered the great Ross Ice Barrier in 78° South lat. Interest in the Antarctic did not revive until after 1890, when an international scheme of research was drawn up. A Norwegian, C. E. Borchgrevink, in 1898–1900, was the first to winter in the Antarctic and to travel on the ice barrier. The British share in this work was carried out by Capt. R. F. Scott's expedition in the *Discovery*, 1901–4. Scott's party sledged across the barrier to 82° 17′ South, then a record "farthest south." A little later, Ernest Shackleton beat this by travelling to within 100 miles of the South Pole. In 1910 Scott organised his second expedition of the *Terra Nova*, and became engaged against his will in a "race for the Pole," when, after his departure, the Norwegian Arctic explorer, Roald Amundsen, suddenly announced that he was sailing for the Antarctic. Amundsen set up his base at the eastern end of the Barrier, and, relying on dog teams for hauling his sledges, reached the Pole on December 14, 1911. Meanwhile Scott and his party, their start delayed by adverse weather, were marching southwards, man-hauling their sledges, for Scott was against the use of dogs. After an arduous journey they reached the Pole one month after Amundsen. The return was a struggle against the weather and increasing weakness, probably due to scurvy, until at last they perished within a few miles of their base. After the First World War the development of the whaling industry greatly stimulated further exploration. Outstanding expeditions included that of Admiral R. E. Byrd, 1929, when he flew over the South Pole; The British Graham Land expedition, 1934, which carried out the first extensive mapping of any part of the Antarctic continent; and the U.S. Navy's Antarctic Expedition of 1940, when the whole continent was circumnavigated and great areas photographed from the air. In recent years valuable work has been done by the first International expedition, the Norwegian–British–Swedish Expedition to Queen Maud Land, and by the French in Adélie Land. The Falkland Island Dependencies Survey, set up during the war, has continued the scientific exploration of Graham Land. The Antarctic was the scene of high adventure during the International Geophysical Year (1957–58), when scientists from many countries participated in the explorations. The Commonwealth Trans-Antarctic Expedition set out from opposite sides of the continent and met at the South Pole, the U.K. party, led by Sir Vivian Fuchs, from the Falklands, and Sir Edmund Hillary and his party from New Zealand. The U.K. party accomplished the first crossing of the White Continent in 99 days. Their scientific work included the making of seismic and complementary gravimetric studies at frequent intervals along the 2,200-mile traverse. Since the Antarctic is becoming important for many reasons, in weather forecasting, in the whaling industry, and as a possible centre for world air routes, the tempo of exploration and research will become even faster in the future.

Anteater. There are two unrelated families of anteaters, the Myrmecophagidae and the Manidae. Among the former the Great Anteater (*Myrmecophaga jubita*) is the largest species, over 6 ft. in length, occurring in Central and S. America. Only half its size is the lesser Anteater (*Tamandua tetradactyla*); this is found in forests of tropical America and Trinidad. The Two-toed Anteater (*Cyclopes didactylus*) belongs to South America and Trinidad. These three animals live mostly on termites; they are adapted to this diet, having large claws for digging out ants, and a tubular mouth with a long sticky tongue. The Manidae are the Scaly Anteaters or Pangolins, widely distributed over Africa and the Orient. The difference between the two families is that the first has hair covering the body, the latter has horny scales instead.

Antennae, paired feelers of insects and crustacea.

Anthem, a choral composition, with or without instrumental accompaniment, usually sung after the third collect in the Church of England service. The words are from the Scriptures, and the composition may be for solo voices only, for full choir, or for both. Among the chief British composers of anthems are Tallis, Purcell, Croft, Boyce, Goss, and Stainer.

Anthracite is a black coal with a brilliant lustre. It contains 92% and over of carbon and burns slowly, without smoke or flame. *See* Coal.

Anthropoid, meaning "resembling man," a sub-order of the primate mammals including man and also the gibbon, chimpanzee, orang-utan, and gorilla.

Antibiotics. *See* **Index to Section P.**

Anticyclone, a region where barometric pressure is greater than that of its surroundings. Such a system is distinguished on weather charts by a pattern of isobars, usually circular or oval-shaped, enclosing the centre of high pressure where the air is calm. In the remaining areas light or moderately strong winds blow spirally outwards, in a clockwise direction in the Northern Hemisphere (and in the reverse direction in the Southern Hemisphere), in accordance with Buy's Ballot's law (an observer with back to wind in Northern Hemisphere has lower pressure to left; in Southern to right). Over the British Isles anticyclonic weather is generally quiet and settled, being fair, warm, and sunny in summer and either very cold and often foggy or overcast and gloomy in winter. These systems move slowly and sometimes remain practically stationary for days at a time, that over Siberia being particularly well defined. Extensive belts of almost permanent anticyclones occur in latitudes 30° N. and 30° S. Persistent anticyclonic weather with easterly winds during the months December to March, 1962–3, brought the coldest and hardest winter to Britain since 1740 (taking the Midlands as representative).

Antimony. Metal element, symbol Sb. In group V of the periodic table. Exists in various forms, the stable form being a grey brittle metal with a layer structure. The other forms are non-conductors. On being burned, it gives off dense fumes of oxide of antimony. By itself it is not of special utility; but as an alloy for hardening other metals, it is much used. As an alloy with lead for type-metal, and with tin and copper or zinc for Britannia-metal, it is of great value. Most important antimony ore is stibnite (antimony sulphide).

Anti-Pope, one elected in opposition to one held to be canonically chosen; commonly applied to the popes Urban VI. and Clement VII., who resided at Avignon during the Great Schism (1378–1417).

Anti-proton, the "negative proton," an atomic particle created in high energy collisions of nuclear particles. Its existence was confirmed in Oct. 1955. *See* **F13(1), 14.**

Antisemitism. *See* **J3.**

Antlers are the branched horns of deer, the branches being called tines. Antlers originate as outgrowths of the frontal bone, and are usually shed once a year. Except in the reindeer and caribou they are restricted to the male.

Apartheid. *See* **J4.**

Ape, a term applied to the gorilla, chimpanzee, orang-utan, and gibbon—the anthropoid apes.

[illegible]

from the sun: the opposite of perihelion.

Aphids. *See* T29 (2).

Apis, the sacred bull worshipped by the ancient Egyptians; also the scientific name for the bee.

Apocalyptic writings are those which deal with revelation and prophecy, more especially the Revelation of St. John.

Apocrypha (hidden writings), the books which were included in the Septuagint (Greek) and Vulgate (Latin) versions of the Old Testament but excluded from the sacred canon at the Reformation by the Protestants on the grounds that they were not originally written in Hebrew nor regarded as genuine by the Jews. The books include: 1 and 2 Esdras, Tobit, Judith, additions to Esther, Wisdom of Solomon, Ecclesiasticus, Baruch, Song of the Three Holy Children, History of Susannah, Bel and the Dragon, Prayer of Manasses, 1 and 2 Maccabees. The term is usually applied to the additions to the old Testament, but there are also numerous Christian writings of the same character.

Apogee, that point in the orbit of a heavenly body which is farthest from the earth; used in relation to the sun, moon, and artificial satellites. The sun's apogee corresponds to the earth's aphelion; the moon's apogee is the point in its orbit most remote from the earth. *See* **Perigee.**

Apostasy is a revolt, by an individual or party, from one form of opinions or doctrine to another. Julian, the Roman Emperor (331–63), brought up as a Christian, became converted to paganism and on coming to the throne (361), proclaimed religious toleration. Hence his name, Julian the Apostate.

Apostles. The twelve apostles who were disciples of Jesus were: Simon Peter and Andrew (his brother), James and John (sons of Zebedee), Philip, Bartholomew, Thomas, Matthew, James, Thaddaeus, Simon, and Judas Iscariot. After the Ascension Matthias was chosen to take the place of Judas. St. Paul is always referred to as the chief apostle, though he is not one of the twelve. St. Barnabas has also been called an apostle.

Apostles' Creed, applied to the most ancient of the Church's statements of its belief: "I believe in God the Father Almighty; and in Jesus Christ his only Son our Lord, who was born of the Holy Ghost and the Virgin Mary. . . ." A later version is used in the Church of England at morning and evening prayer.

Apostolic Fathers were the immediate disciples or followers of the Apostles, especially such as left writings behind. They included Barnabas, Clement of Rome, Ignatius of Antioch, Hermas, Papias of Hieropolis, and Polycarp.

Appeasement Policy. The name of the policy during 1937 and 1938 of yielding to the demands of Hitler and Mussolini in the hope that a point would be reached when the dictators would co-operate in the maintenance of peace. The policy culminated in the Munich Agreement (which was the subject of much criticism) after a series of concessions including the recognition of the Italian conquest of Abyssinia and the German annexation of Austria. The policy was finally demonstrated as futile when Hitler seized Czechoslovakia in March 1939.

Appian Way, the oldest and finest of the Roman roads originally laid by Appius Claudius (312 B.C.) from Rome to Capua and thence to Brundisium (Brindisi).

Approved Schools are residential schools, subject to Home Office inspection, for the training of young persons under 17 who, because of disturbed behaviour as a result of unfavourable influences such as bad environment or parental neglect, are guilty of offences or in need of care and protection and have been sent to them by magistrates from juvenile or other courts. Corporal punishment is being phased out and many people think that there should be more psychiatric help available. *See also* **Detention Centre, Borstal.**

April, the fourth month of the year, from the Roman *Aprilis* derived from *aperire* "to open"—the period when the buds begin to open.

Apse is a semicircular recess, arched or dome-roofed, at the end of the choir, aisles, or nave of a church.

Aquatint is a method of etching on copper, by which imitations of drawings in water-colours, Indian ink, bistre, and sepia are produced.

Aqueducts are conduits in which water flows or is conveyed from its source to the place where it is to be used. Most famous builders were the Romans and the oldest Roman aqueduct was the *Aqua Appia*, which dates from about 310 B.C. Among modern aqueducts may be mentioned that of Glasgow, which brings water to that city from Loch Katrine; that of Manchester, which taps Thirlmere; that of Liverpool, with Lake Vyrnwy in North Wales as its source, and the Fron Aqueduct, Radnorshire, which carries water from the Elan Valley to Birmingham.

Arabesque, the term applied to the elaborate decoration based on flowing lines used in Moorish art.

Arabian Nights, a collection of fascinating tales of the Orient, of mixed Indian, Persian, Arabic, and Egyptian origination, and first made known in Europe by Antoine Galland, a French Oriental scholar whose original translation was called *The Thousand and One Nights*.

Arabic Numerals. The modern system of numbering 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, in which the digits depend on their position for their value, is called the Arabic numerical notation. The method is, in fact, of Indian origin. By the 9th cent. Hindu science was available in Arabic, and the Persian mathematician Al-Kwarizimi (c. 830) in his *Arithmetic* used the so-called "Arabic" system of numbering. Gradually the method spread to Europe, taking the place of the Roman system which was useless for calculation. The West is indebted to the Arabs for the zero symbol, the lack of which had been a serious drawback to Greek mathematics. It made the invention of decimal fractions possible.

Aragonite, the unstable form of calcium carbonate found as a mineral in some young deposits. It crystallises in the orthorhombic system but tends to revert to calcite (*q.v.*).

Aramaic Languages, the Semitic dialects current in Mesopotamia and the regions extending southwest from the Euphrates to Palestine from about the 12th cent. B.C. until after the rise of Islam, when Aramaic was superseded by Arabic. Both Aramaic and Greek were spoken in Palestine during the time of Christ. *See* M30(2).

Archaeopteryx, a fossil bird providing a connecting link between reptiles and birds. It had feathers, jaws with teeth, no bill, reptilian bones and skull, a long tail, and it probably used its fore-limbs for gliding flight. The first specimen, found in 1861, in the Solenhofen limestone of Bavaria, is in London's Natural History Museum.

Archbishop, the chief of the bishops of an ecclesiastical province in the Greek, Roman, and Anglican churches. In the Church of England there are two archbishops, the Archbishop of Canterbury, called the Primate of *all* England, and the Archbishop of York, styled the Primate of England.

Archimedes' Principle. When a body is weighed in air and then in any fluid, the apparent loss in weight is equal to the weight of fluid displaced. This scientific fact was noted by the Syracusan philosopher Archimedes (287–212 B.C.) and is frequently used as a basis for density measurements.

Architecture, the art and science of building. The provision of shelter for mankind by the orderly arrangement of materials in a manner which expresses man's attitude to living. The forms which buildings take are the outcome of the function for which they are to be used, of the architect's aesthetic sensibility and of the structural method adopted. Until the last hundred years structural methods were limited to timber frames, and columns, lintels, load-bearing walls, arches, vaults, and domes in brick or stone. From these few basic elements have evolved the great variety of historic styles of building to be found throughout the world. To give but one example, the Greeks created those systems of decorated columns and beams, known as the Orders, which were adapted by the Romans, revived decoratively rather than structurally during the Renaissance and are still used in debased form on the more presumptuous type

of modern building. In recent years, however, architecture has taken on a new meaning. Once confined to the rich, in the form of Church, State, or Commerce, it is now, with the coming of democracy, recognised as an essential social service for all. This, and the development of new structural techniques and materials (steel, aluminium, sheet glass, reinforced concrete, plastics, and plywoods, to name a few), have made the interest in historic styles, the mainstay of the older architect, of secondary importance. Modern architecture is the creation of buildings with the highest possible standards of functional performance in terms of efficient planning and structure, good artificial and natural lighting, adequate heating or cooling, and proper acoustic conditions consistent with the price the client can afford to pay. At the same time the architect's task is to design a structure, and the spaces the structure delimits, internally and externally, which are æsthetically stimulating and satisfying, and well related to the land and buildings around.

Arctic Exploration. Modern exploration of the Arctic begins in the 16th cent., when men sought to reach the East Indies by sailing through the Arctic to the Pacific Ocean. The North-east Passage, via the shores of northern Asia, was the first attempted. In 1553 and 1554 the English navigators Sir Richard Chancellor and Stephen Burrough sailed into the White Sea, but were prevented by storms and ice from advancing farther eastwards. The project was later revived by the Dutch; Barendts in 1594 discovered Spitsbergen, but also failed to get beyond Novaya Zemlya. It was not, in fact, until 1879 that the Swede, A. E. Nordenskiöld, in the *Vega*, succeeded in reaching the Pacific. The attempts to find a North-west Passage were more numerous and determined. In 1585 John Davis penetrated Davis Strait and coasted along Baffin Island. Hopes ran high when Henry Hudson discovered Hudson Bay in 1610, but a practicable passage continued to elude explorers. The problem was to find a navigable route through the maze of channels in the short summer season, and to avoid being frozen in with supplies exhausted. After the Napoleonic Wars the Admiralty sent out many naval expeditions which culminated in Sir John Franklin's expedition with the *Erebus* and *Terror* in 1845. The ships were beset by ice in Victoria Channel and, after Franklin's death, were abandoned by their crews, who perished from scurvy and starvation on their march southwards. To ascertain their fate, several further expeditions were despatched, and the crew of the *Investigator*, commanded by R. J. M'Clure, sailing eastwards from Bering Strait, were the first to make the Passage, though in doing so they were obliged to abandon their ship. It was thirty years before the Norwegian, Roald Amundsen, succeeded in sailing the *Gjoa* from east to west. In the meantime, the North Pole had become the goal of explorers. Nansen, in 1893, put the *Fram* into the ice-pack to drift across the Polar basin, and himself made an unsuccessful attempt on the Pole across the pack. This was eventually achieved by the American explorer Robert E. Peary, who after several expeditions in the North Greenland region, sledged to the Pole with Eskimo companions in 1909. The next phase was the employment of airships and aeroplanes in Arctic exploration. In 1926 Admiral Byrd made the first flight over the Pole, and in the same year Amundsen and Lincoln Ellsworth flew the airship *Norge* from Spitsbergen to Point Barrow, Alaska. Two years later, the *Italia*, commanded by the Italian, Nobile, was wrecked on a return flight from the Pole, and Amundsen lost his life in an attempt to rescue the survivors. With modern developments in aircraft and navigation, flights over the Polar basin are almost a routine matter, and passenger flights between Europe and America via northern Greenland are being pioneered. The first voyage under the North Pole was made in August 1958 by the American nuclear-powered submarine *Nautilus*.

Arenaceous Rocks, the rocks composed of grains of sand, chiefly sandstones; quartz is the most abundant mineral in these rocks.

Argillaceous Rocks are a sedimentary group, including the shales and clays.

Argon, chemical element, symbol A. This was the first of the inert gases (*q.v.*) to be isolated from air by Rayleigh and Ramsay in 1894. Argon is used for filling gas-filled metal filament electric lamps. In gas discharge tube it gives a blue glow.

Arithmetic, the branch of mathematics that deals with numerical calculations as in counting, measuring, weighing. The early civilisations used simple arithmetic for commercial purposes, employing symbols and later letters of the alphabet as numerals. When Hindu-Arabic numerals replaced Roman numerals in the Middle Ages it meant a great step forward and led to rapid developments—the invention of logarithms, slide-rule, calculating machines.

Ark of the Covenant was the sacred chest of the Hebrews and symbolised God's presence. It was overlaid with gold inside and outside. It accompanied the Israelites into battle and was once captured by the Philistines. Eventually it found a resting-place in Solomon's Temple.

Armada, Spanish, the naval expedition fitted out by Philip II. of Spain in 1588 against England, commanded by the Duke of Medina Sidonia. It comprised 129 ships, was manned by 8,000 sailors and carried 19,000 soldiers and more than 2,000 cannon. Against this formidable force Elizabeth had only 80 ships, manned by 9,000 sailors, under Lord Howard of Effingham, under whom served Drake, Hawkins, and Frobisher. The British Fleet awaited the Armada off Plymouth, and at Tilbury there was a considerable defensive land force under the command of the Earl of Leicester. On July 19 the ships of the Armada were sighted off the Lizard, disposed in a crescent seven miles long from horn to horn. The excellent manoeuvring of the English, their fire-ships, and a gale from the N.W. combined so effectively to cripple the Spanish ships that the Armada was scattered in confusion, a very small remnant contriving to reach home via the North of Scotland. It was impossible to embark the army of Parma waiting in the Netherlands. Elizabeth had a medal struck bearing in Latin the inscription, "God blew, and they were scattered."

Armadillo, a genus of animals related to the sloths and anteaters, belonging to South America, and carrying a hard bony covering over the back, under which one species (*Tolypeutes*) can completely conceal itself when attacked, rolling itself up like a hedgehog.

Armageddon, according to the Revelation of St. John, the great battle in which the last conflict between good and evil is to be fought.

Armillary Sphere, an early form of astronomical apparatus with a number of circles representing equator, meridian, ecliptic, etc. Used by Hipparchus and Ptolemy and up to the time of Tycho Brahe for determining the position of the stars.

Aromatic. A term used by chemists, originally to describe compounds like benzene, having a characteristic smell. It is a term which implies a collection of chemical characteristics, the salient features being a flat ring structure and a general similarity to benzene.

Arsenic, a metalloid element, symbol As, in group V of the periodic table, usually met with as a constituent of other minerals, sometimes by itself. Its compounds are very poisonous. Lead arsenante is a powerful insecticide used for spraying fruit trees. The more stable allotropic form (grey) has a layer structure, and conducts electricity.

Artesian Wells take their name from Artois in France, where the first wells of this kind were constructed in 1126. They are to be found only when a water-bearing bed is sandwiched between two impervious beds. When a boring is made to the lower part of the bed, the pressure of water is sufficient to cause the water to overflow at the surface. Artesian wells were known to ancient Egypt and China, and have existed in the Sahara since the earliest times. The fountains in Trafalgar Square are fed by artesian wells sunk through the London clay into the chalk about 400 ft.

Arthur's Seat, a hill of volcanic origin, 823 ft. high,

dominating Holyrood Park, to the south-east of Edinburgh.

Articles. The *Six Articles* are those contained in an Act of Henry VIII. and were of Roman Catholic origin. The *Thirty-Nine Articles* drawn up in 1563 comprise the doctrines of the Anglican Established Church, and must be subscribed to by all taking holy orders therein.

Art Nouveau, a term applied to the "new art" which spread across Europe and the U.S.A during the 1890s. It was mainly a style of architecture and interior decoration which attempted to break with the old traditions of darkness and "heaviness" by the use of the new materials of cement, steel, and glass from which it created patterns characterised by: (*a*) over-elaboration; (*b*) relatively naturalistic but tortuous representations of plants, etc.; (*c*) a ubiquity which left no surface undecorated. Typical of the extravagances of Art Nouveau are the cast-iron lilies with copper tendrils, the cupboard doors and chair-backs with heart-shaped holes, and the furniture shaped like animals, examples of which are still with us. In Britain the movement was basically a continuation of the Arts and Crafts movement of William Morris; Aubrey Beardsley represented this essentially fin-de-siècle school in his drawings.

Arts and Crafts Movement, the English revival of decorative art which began about 1875 as a revolt against the existing vulgarity of internal decoration and furnishings and the pettiness of academic art. Inspired by William Morris and Burne-Jones together with Rossetti, it was strongly influenced by the former's mediaevalism, his hatred of industrialism, and his own version of socialism which included the regeneration of man by handicrafts. His firm of Morris & Co. produced wallpapers, tapestries, furniture, stained-glass windows, carpets, and fabrics in a style totally different from that of contemporary Victorian decoration. Morris's Kelmscott Press did much to raise the standards of book design and printing. *See* Art Nouveau.

Arum, a genus of plants of the Araceae family, of which there is but one British species, the wake-robin or cuckoo-pint, sometimes also styled "Lords and Ladies." Its pointed leaves and spikes of scarlet poisonous berries are familiar in the hedgerows.

Arundel Marbles, a collection of ancient Greek sculptures formed by Thomas Howard, Earl of Arundel, in the 17th cent. and presented to Oxford University by his grandson, Henry Howard, who became Duke of Norfolk.

Aryans, nomadic peoples who made their way in successive waves from the Eurasian steppes to the Indus and the Nile during the first half of the 2nd millennium B.C. They crossed the Hindu Kush into N.W. India and settled in the valleys of the Indus and Ganges, where an earlier Indus civilisation had flourished, *c.* 3250–2750 B.C. Their religious ideas are reflected in the Veda (oldest Hindu scriptures, written down many centuries later in Vedic, parent language of Sanskrit). Those who made their way to Syria and Egypt founded the Hyksos empire (*c.* 1680–1580 B.C.). The Aryans introduced the horse-drawn chariot and spoke a language from which the great Indo-European family of languages is derived, with one group in India and Iran, and another in Europe. *See* M30.

Asafoetida, an acrid, strong-smelling gum resin exuded from the stem of an umbelliferous plant, *Ferula foetida*, found in Persia and Afghanistan. Formerly used medicinally to treat hysteria; still used in cooking in India, Iran, and France.

Ascension Day, or Holy Thursday, is the 40th day after Easter.

Ascot Races are an annual fashionable function dating from 1711 and taking place on Ascot Heath, only six miles from Windsor, in June. These races have always had royal patronage. The course is nearly two miles long.

Ash, a familiar deciduous tree of the genus *Fraxinus*, of over 60 species, native to North-temperate regions. The ash held an important place in Norse mythology, as it was supposed to support the heavens with its roots in Hell. The species native to Britain, and to Europe, is *F. excelsior*, a tall tree with compound leaves, greenish flowers, winged seeds, and black buds in winter. It is a valuable timber tree, tough and elastic, and largely used for wheels and handles. The rowan, or mountain ash, *Sorbus aucuparia*, with similar leaves and orange berries, belongs to a different family. *F. pendula* or weeping ash is a weeping strain which makes an ideal natural summer house.

Ashes, The, the symbol which distinguishes the winning cricket team in the Australian Test Matches. In 1882 the Australians won at the Oval by 7 runs. After the match the following epitaph appeared in the *Sporting Times*: "In affectionate remembrance of English Cricket which died at the Oval on Aug. 29, 1882, deeply lamented by a large circle of sorrowing friends and acquaintances. R.I.P. NB. The body will be cremated and the ashes taken to Australia." When the English Eleven went to Australia the same winter it was said that they had come to recover the "ashes." England won two out of three matches, and after the third match the ashes of what is now generally believed to have been a stump were presented in an urn to Ivo Bligh, later Lord Darnley. He bequeathed the urn to the M.C.C., and it now stands in the Memorial Gallery at Lord's.

Ash Wednesday, first day of Lent, being the seventh Wednesday before Easter, on which ashes are sprinkled on the head as sign of penitence, a practice dating from the Middle Ages.

Asp, a small poisonous snake, often mentioned in ancient literature and traditionally supposed to have been used by Cleopatra in killing herself. Probably the Egyptian Horned Viper (*Cerastes*).

Assassination, treacherous murder for political ends, usually of a ruler or distinguished person. Among the most famous assassinations of history were: Julius Caesar, 44 B.C.; Thomas à Becket, 1170; David Rizzio, 1566; William the Silent, 1584; Henry IV. of France, 1610; Jean Paul Marat, 1793; Abraham Lincoln, 1865; Alexander II. of Russia, 1881; Archduke Francis Ferdinand of Austria, 1914; Dr. Dollfuss, 1934; King Alexander of Yugoslavia, 1934; Mahatma Gandhi, 1948; King Abdullah of Jordan, 1951; Liaquat Ali Khan, 1951; King Feisal of Iraq, 1958; Mr. Bandaranaike, 1959; President Kennedy, 1963; Dr. Verwoerd, 1966; Dr. Martin Luther King, 1968.

Asteroids are minor planets most of whose orbits lie between those of Mars and Jupiter; they were unknown until the discovery of Ceres by Piazzi in 1801. More than a thousand have been named and many thousands are believed to exist. After 1891 they were identified by their paths on exposed photographic plates. Most of them have a diameter of well under 50 miles. Ceres, with a diameter of *c.* 480 m., is the largest, then there are Pallas (*c.* 304 m.), Juno (120 m.), Vesta (240 m.), Astraea, Adonis, Hermes, Hidalgo, Eros, Amor, Apollo, and the Trojan group which all take their names from Homer's *Iliad*—Achilles, Patroclus, Hector, Nestor, Priam, Agamemnon, Ulysses, Aeneas, Anchises, Troilus, Ajax, and Diomede. The asteroid Icarus (diameter *c.* ½ mile) makes the closest approach to the Sun, and was within a few miles of the Earth on June 15, 1968. A full list of asteroids with explanation of all the names has been issued by the Spanish astronomical historian, Prof. A. Paluzie-Borrell.

Astrolabe, a mediæval scientific instrument for taking altitudes, observing the sun by day and the stars by night, and used for telling the time and finding the latitude. Used by the ancient Greeks, later by the Arabs and Persians, and introduced into Europe by way of Spain in the 14th cent. Chaucer is said to have sent his son Lois, a ten-year-old student at Oxford, an astrolabe with a treatise on its use in 1391.

Astronomical unit, the mean distance from the centre of the earth to the centre of the sun, or half the major axis of the earth's elliptical orbit. It has been known for some 300 years that the earth–sun distance is roughly 93 million miles, but over the past 60-odd years astronomers have attempted to determine it with ever-greater accuracy, using various methods of computation. Spencer Jones (1931) deduced a value of 93,004,000 miles; the American astronomer E. K. Rabe (1950) obtained a value of 92,914,800 miles; and data from the *Pioneer V* space probe gave a value of 92,925,100 miles. The

earth–sun distance is a fundamental value in astronomy.

Astrology. *See* J5.

Astronomy, the oldest and one of the most fascinating of sciences, was in early times associated with astrology, but by a long series of observations and mathematical calculations a gradual knowledge of the movements of the heavenly bodies grew up. Pythagoras (520 B.C.) understood the revolution of the earth upon its axis, but it was not until two thousand years later that his theory gained general acceptance, when the keen and spacious minds, first of Copernicus, and then of Tycho Brahe and Galileo, demonstrated the truth of the Pythagorean theory. With the setting forth of the Copernican system, astronomy was placed on a sure foundation, and the movements of the planets began to be more clearly comprehended. The studies of Kepler and Galileo, making their observations with the telescope, resulted in an immense increase of astronomical knowledge. Newton, to whom we owe the discovery of the law of gravitation, the improvement of the telescope and many other discoveries, placed physical astronomy on well-defined lines. Two great landmarks in more recent times were the discovery of Uranus by Herschel in 1781 which extended the solar system as then recognised, and the estimation by Hubble in 1924 of the distance of Andromeda of nearly a million light years (more recent determinations give 1,500,000 light years), which showed that our Galaxy was just one of many. Today radio-telescopes and space probes are advancing astronomical knowledge and making it possible to explore regions beyond the scope of optical telescopes. The following have held the position of Astronomer Royal (period of office in brackets): John Flamsteed (1675–1719), Edmund Halley (1719–42), James Bradley (1742–62), Nathaniel Bliss (1762–65), Nevil Maskelyne (1765–1811), John Pond (1811–35), Sir George Airy (1835–81), Sir William Christie (1881–1910), Sir Frank Dyson (1910–33), Sir Harold Spencer Jones (1933–55), Sir Richard Woolley (1956–). *See* F5–7.

Astrophysics, a branch of astronomy concerned with the physical nature and constitution of celestial bodies. The application of spectroscopy and photometry since the second half of the 19th cent. and of space research in recent years has been responsible for the great advance in this branch of science.

Athanasian Creed, one of the three ancient creeds of the Christian Church, often referred to as the *Quicunque Vult*, is a statement of the doctrine of the Trinity and the Incarnation, and though named after St. Athanasius, the view is now widely held that it is the work of St. Ambrose (339–97). *See also* **Apostles' Creed** and **Nicene Creed.**

Athodyd, also called "Ramjet" or "Propulsive Duct." This can be considered as an extremely simple gas-turbine engine, without any rotating parts. A power plant with great possibilities for high-speed aerial flight, it consists of a diffuser, combustion chamber, and exhaust chamber; its thrust results from the fact that the gases leaving the athodyd have a higher velocity than the gases entering it.

Atmosphere is the gaseous envelope of the earth, and consists of a mixture of gases (*see* **Air**) and water vapour, the variability of the latter being of great importance meterologically. The ozone layer, which absorbs ultra-violet radiation which would be lethal to plant life if it reached the ground, is concentrated at about 20 miles above the earth but extends to about twice that height. The lower level of the atmosphere up to a height of about 7 miles (6 miles at the Poles and 10 miles at the Equator) is known as the *troposphere*, and it is in this region that nearly all weather phenomena occur. This is the region of most interest to the forecaster studying temperature, humidity, wind-speeds, and the movement of air masses. Temperature falls with height by about 1° C. per 500 ft. in this layer. The *tropopause* is the boundary between the troposphere and the *stratosphere*. Temperature varies little in the lower levels of this region: it is mainly cloudless, and has no vertical currents. Strangely enough, the lowest temperatures of the atmosphere are to be found not at the Poles, but at about 11 miles above the Equator, where a temperature as low as −80° C. has been recorded! Temperatures begin to rise about 20 miles from the earth's surface at about the same rate as they fall in the troposphere, owing to the absorption of solar radiation by the concentration of ozone. The stratospheric air is extremely dry. Near the 60-mile level a number of important atmospheric phenomena occur. Above this level the oxygen becomes predominantly monatomic in contrast to the normal diatomic form at lower altitudes. This is the *ionosphere*, extending to heights over 500 miles from the earth's surface. This layer acts as an electrical radio mirror which makes long-distance radio transmission possible. The auroras are most frequently observed at altitudes near 60 miles but do extend at times far higher. *See also* **Ionosphere.**

Atmospherics are electrical impulses which are believed to originate in atmospheric electrical discharges such as lightning. They give rise to crashing background noises in the loudspeakers of radio sets, interfering with reception at distances of up to 4,000 miles from the centre of the disturbance. The location of atmospherics with the aid of radio direction-finding methods gives warning of the approach of thunder-storms.

Atom. *See* F9–14.

Atomic Pile, an apparatus containing a fissionable element and a moderator, such as heavy water or graphite, in which a self-sustaining fission process proceeds at a controllable rate. The first atomic pile, constructed on a squash court at Chicago, was operated for the first time on December 2, 1942, under the direction of Dr. Enrico Fermi. The pile contained 12,400 lb. of uranium. *See* **Nuclear Reactors.**

August, named after the Emperor Augustus, because it was his "lucky" month.

Auks, duck-like sea-birds, black and white, with short, narrow wings compact bodies, and legs set well back. Breed in colonies on rocky coasts of N. Europe (incl. British Isles) and spend most time in coastal waters. Migrate south in winter. The Auk family includes the Razorbill, Little Auk, Guillemot, and Puffin. The Great Auk became extinct in the 19th cent. after ruthless hunting for the sake of its feathers. Except for the Black Guillemot, they lay only one egg a year.

Aulic Council, a supreme court of the Holy Roman Empire, established by Maximilian I., in 1501.

Aurora polaris. This wonderful phenomenon of the night sky is a common sight in some high latitudes, north and south. It is visible less often in temperate latitudes, and only very seldom in the tropics. As seen in the northern hemisphere it is called the aurora borealis or northern lights, and in the south, the aurora australis or southern lights. The zone of maximum frequency surrounds the north magnetic pole and includes Greenland, northern Canada, and the north coast of Alaska. Auroral displays may take several forms, *e.g.*, a faint glow, a diffuse ribbon of light crossing the heavens, great folded waving curtains like draperies; the whole sky may be a grand panoply of light. Both the aurora and the magnetic storm associated with it are ascribed to the envelopment of the earth in a great cloud or stream of solar gas shot out from stormy areas on the sun (sunspots) that has travelled to the earth at a speed of over a thousand miles a second. The gas is mainly atomic hydrogen, but the atoms are broken up into their two parts, protons and electrons. These are both electrically charged. This renders them subject to the influence of the earth's magnetic field, which deflects many of them to the high latitudes where the aurora is most commonly seen. The aurora is a kind of light essentially different from that of the rainbow which is a partly subjective phenomenon. Each beholder sees his own rainbow, whose light is sunlight refracted and reflected by many raindrops. The raindrops that produce his rainbow depend on his position as well as on the direction of the sun. The aurora, on the contrary, is a light as objective as that of a candle, though produced differently. It is a self-luminescence

of the air in particular regions of the atmosphere that lie far above the clouds. By simultaneous observation from stations twenty or more miles apart it is possible to locate the position of the luminous air, *i.e.*, to determine the height of the aurora, its location in plan, and its form and volume.

Austerlitz, Battle of, was fought near Brünn, in Moravia, on December 2, 1805, when Napoleon defeated the Russians and Austrians under Kutuzon.

Auto-da-Fé, or Act of Faith, was the ceremony connected with the sentencing of heretics under the Inquisition of Spain and Portugal, the persons found guilty being imprisoned or burned alive. The ceremony took place in some public square, sometimes in the presence of the king and court.

Automation is a recently coined word used to designate the adoption of methods of automatic control either of manufacturing processes or of any business process involving a large mass of routine work. The word is used in broader and narrower senses. In its broadest sense it covers any form of mechanisation which largely replaces human labour by the work of automatic or semi-automatic machines, such as has been in progress continuously since the Industrial Revolution; but it is better kept to a narrower meaning, in which it is confined to the recent development of electronic or similar devices, involving feedback (automatic detection and correction of malfunction). Human labour is eliminated save for that needed for watching and maintaining the elaborate machines used. In this sense, automation began mainly in the United States, but has been spreading rapidly to other advanced countries. *See* **G14(1).**

Autumn, the third season of the year, begins with the autumnal equinox, and ends with the winter solstice, but the term is generally understood as covering the period from mid-August to mid-November.

Auxins, "plant hormones," organic substances produced by plants to regulate growth. Synthetic auxins are now widely used, *e.g.*, for promotion of root formation in cuttings, differential weed control, prevention of premature dropping of fruit, in storage of potatoes and hard fruit, and to overcome frost damage to fruit buds.

Average is a single number designed to give a typical example of a set of numbers, *e.g.*, a cricketer's batting average for a season gives an idea of his typical score. There are several kinds of average and their uses are studied in the science of statistics (*q.v.*). A statement that "so and so is the average value" can be misleading if one does not know which average is meant. Three common averages are: the arithmetic average (or mean), the mode, and the median. The arithmetic average of *n* numbers is found by adding them together and dividing by *n*; this is a very common method of averaging. The mode of *n* numbers is the most frequently occurring number. The median is the middle number, *i.e.*, the number which is smaller than just as many of the other numbers as it exceeds. Of the numbers 1, 2, 2, 2, 2, 3, 4, 5, 6, 8, 9, the arithmetic mean is 4, the mode is 2, the median is 3.

Avocet, a graceful wading bird related to the stilts, of black-and-white plumage, bluish legs, and slender upturned bill. There are four species. Avocets nest in colonies and there is one in the sanctuary on Havergate Island, Suffolk.

Avogadro's Hypothesis. This is a fundamental concept of chemistry. Equal volumes of all gases under the same conditions of temperature and pressure contain the same number of molecules. This law was instrumental in assigning the formulæ of molecules. The hypothesis was put forward in 1811, but was not generally accepted until 1860.

Aztecs, the name of a native and powerful race found in Mexico when the Spaniards first discovered that country, and with difficulty subdued.

B

Babiroussa, a ferocious, long-legged wild pig, native of the Celebes, sometimes called the horned-hog, because of the long upper tusks in the male, which are developments of the canine teeth which grow upwards, piercing the upper lip, and curving backwards, often broken in fighting.

Baboon, monkeys belonging to the African genus *Papio*. They are considered the lowest of the Old World (Catarrhine) monkeys, and walk on all fours. In the main terrestrial, but take to trees after food. The mandrill is closely related.

Babylonian Captivity, the period spent by the Jews in Babylon after Jerusalem was captured by Nebuchadnezzar, the Babylonian emperor, in 586 B.C. Traditionally the captivity lasted 70 years, but when Babylon was in turn taken by Cyrus in 538 B.C., the exiles were permitted to return to Jerusalem. The term is also applied in church history to the period 1309–78 when the papacy moved to Avignon, into the control of the French monarchy.

Badger, a carnivorous mammal related to the weasel, of nocturnal and burrowing habits, inoffensive, subsisting chiefly on roots and insects, though sometimes mice, young rabbits, and eggs form part of its diet. Badger-baiting was a favourite sport in Britain until it was prohibited in the middle of the 19th cent. The badger does little harm and quite a lot of good; badger digging is to be condemned as a cruel sport.

Bagpipe. Once popular all over Europe, this instrument is still played in Scotland, Ireland, Brittany, and elsewhere. The bag acts as a reservoir of air and, when squeezed by the player's arm, forces air through the pipes. One of these, the Chanter pipe, provides the tune and is played by the fingers as in a flageolet. The remainder, the Drone pipes, give a continuous, unvarying note.

Bailey Bridge, invented by Sir Donald Bailey and first used in N. African campaign 1942–3. Built up of pre-fabricated girders, it can be easily transported and erected.

Bailie, is a Scottish term for the magistrate of a municipal corporation or royal burgh.

Bailiwick, a feudal term denoting the limits of a bailiff's jurisdiction. The term has survived in the Channel Islands, where Jersey and Guernsey are Bailiwicks.

Bakelite. A plastic material made from phenol, formaldehyde, and urea. It is used in the manufacture of electrical fittings because of its insulating properties.

Balance of Power was the doctrine in British policy whereby European groups should be so balanced as to prevent the emergence of a dominating Power. Thus the balance was maintained between the Triple Alliance (Germany, Austria and Italy) and the Triple Entente (Great Britain, France and Russia) and preserved peace from 1871 to 1914. After the first world war there was tentative support of Germany's recovery to counterweight a possible French hegemony; but when Germany's power grew under Hitler culminating in the second world war, Britain, France and Russia again became allies. By the end of the war the old system of a balance of power centred upon Europe collapsed to give way to a thermonuclear balance of power between the super-Powers, the Soviet Union and the United States.

Baldachin (It. *Baldachino*), a canopy usually supported by four pillars over throne, altar, or other sacred object. The name is also applied to the silken canopy used in processions and borne by the priest who carries the Host.

Balearic Crane, the crowned crane of the Balearic Islands and the North African mainland, distinguished by its yellowish, black-tipped occipital tuft and by its trumpet note.

Baleen *or* "**whalebone**" the name given to a series of horny plates growing from the roof of the mouth in those whales classified as Whalebone or Baleen Whales (Mystacoceti) There are 300–400 or so plates on each side, and their inner edges are frayed, the whole system constituting a filter for collecting minute organisms used for food. The Baleen Whales include the Right-Whales, the Pacific Grey-Whale, and the Rorquals. *See* **Whales.**

Ballet is a combination of four arts; dancing, music, painting, and drama, each of which is ideally of equal importance. The movement of

the individual dancers and the "orchestration" of the whole group is in the hands of the choreographer. The dancer's training follows certain basic rules but save in classical ballet there is considerable freedom of movement. Ballet as we know it today developed professionally at the Court of King Louis XIV. of France, though it owes its origins to Italy and in the earliest times to Greece and Rome. Its movements were made up from the dances of courtiers, country folk and tumblers. Technique grew more complex as costume became modified, the body gaining complete freedom with the invention of tights. A succession of great dancers—French, Italian and latterly Russian left their imprint on the art. Contemporary ballet reflects the aesthetic of the Russian, Sergei Diaghilev. In England Dame Ninette de Valois has laid the foundation of a national ballet, at Sadler's Wells and Covent Garden, with a personality that reflects the national character. A Royal Charter was granted in 1957 setting up the Royal Ballet to co-ordinate the activities of the Sadler's Wells group.

Ballistics, the science dealing with the motion of projectiles, especially shells, bombs, and rockets. Great advances have been made in this science in recent years.

Balloon, the modern balloon consists of a bag of plastic material inflated with a gas lighter than air. The first ascent by man in a hot-air balloon was made on Nov. 21, 1783, and in a hydrogen balloon on Dec. 1, 1783. The most famous of the early scientific flights by manned balloons were those of the Englishmen Coxwell and Glaisher, in 1862, when a height of 7 miles was reached. The first aerial crossing of the English Channel by Blanchard and Jeffries was made on 7 Jan. 1785. Piccard's ascent to 10 miles, in 1931, marked the conquest of the stratosphere. Four years later the huge American balloon Explorer II, inflated with nearly 4 million cubic feet of helium, carried a team of scientists with their floating laboratory to an altitude of 14 miles. In 1957 a pressurised balloon carrying an American doctor rose 19 miles above the Earth. Captive kite-balloons were widely used in the war as defensive measures against air attack. Meteorologists send their instruments up in balloons to collect data about the upper atmosphere, and of recent years physicists have learned much about cosmic radiation from the study of photographic plates sent to the upper regions in balloons. The American balloon satellites *Echo I* and *II* move round the Earth in orbits several hundred miles high, and, as the brightest of the earth satellites, can be seen with the naked eye as brilliant points moving across the sky. Ballooning as a hobby is carried on by a number of enthusiasts.

Balsam, a big genus (140 species) of flowering plants. Many species are cultivated for their showy flowers, *e.g. Impatiens noli-me-tangere*, the yellow balsam or "touch-me-not," so called because the fruit explodes when touched, slinging out the seeds. Balsam fir is a conifer (*Abies balsamea*) from which Canada balsam gum is obtained.

Baltimore Bird, a lively black-and-orange bird of the oriole sub-family extending from Brazil to Canada; builds a well-constructed hanging nest, and has a fine voice.

Bamboo, a genus of strong grasses, some species growing to over 120 ft. in height; much used by oriental peoples for all kinds of purposes. The young shoots of some species are tender and esculent. *See* T5(2).

Banana (family *Musaceae*), a large herbaceous plant cultivated in moist regions of the tropics, and one of the most productive plants known. The main areas of commercial cultivation are in tropical America, the Canary Islands, and West Africa. World production is estimated at 20 million tons, of which only 3 million are for trade.

Bandicoots, Australasian marsupial mammals, of the size of a large rat or rabbit. They are burrowing animals living largely on insects. The rabbit-eared bandicoot, restricted to Australia, has shrew-like snout, long ears like a rabbit, long crested tail, and a silky coat. The long-nosed bandicoot has a spiny coat and comes from E. Australia. The pig-footed bandicoot has two functional toes on the foot, like a pig.

Bantu (native word = people), term loosely used for large family of Negro races of Southern Africa. *See* **Negroes, African languages, M28.**

Baobab, a tropical African tree. The species *Adansonia digitata* is one of the largest trees known, though not the tallest; the trunk can reach 30 ft. in thickness. The fruit is woody, but its juice provides a cooling beverage. The bark yields a fibre used for making rope and cloth.

Barbary Ape, a large monkey belonging to the genus *Macaca*. It is the only monkey living in relative freedom in Europe, a small colony being found on the Rock of Gibraltar. It has no tail.

Barberry, a genus of berry-producing shrubs containing a hundred species. Several species are cultivated for their flowers and bright berries. Has an interesting pollination mechanism; the base of each stamen is sensitive to touch, and insects probing for nectar cause top of stamen to spring inwards, so dusting visitor's head with pollen which can then be carried to the next flower visited. The common barberry (*Berberis communis*) harbours one stage of the fungus that causes rust of wheat.

Barbican, a fortified entrance to a castle or city, with projecting towers. In the London street called Barbican there was formerly a barbican in front of the city gates.

Barbiturates. A group of drugs derived from a parent compound called barbituric acid: phenobarbitone is the best-known example. They induce sleep and are used in the manufacture of sleeping pills and sometimes as anaesthetics, but they have the disadvantage of being habit forming. *See also* **P23(2).**

Barbizon School, a school of mid-19th-cent. landscape painters whose main tenet was a return to nature with an exact rendering of peasant life and country scenery painted on the spot. It was named after the village of that name in the Forest of Fontainebleau, where its chief members—Millet, Theodore Rousseau, Daubigny, and Diaz—made their home. Their practice of painting direct from nature, which was far from universal at that time, made them the precursors of **Impressionism** (*q.v.*).

Barcarolle, a Venetian gondolier's song applied to instrumental as well as vocal compositions.

Bard, among the ancient Celts a poet or minstrel whose mission was to sing of heroic deeds. He was supposed to have the gift of prophecy, and was exempt from taxes and military service.

Barilla, soda carbonate or soda ash obtained by burning certain salt-marsh plants (*e.g.* the saltwort, *Salsola kali*). It used to be in great demand, until the product of the Leblanc and then the Solvay ammonia-soda process was made available by the chemical industry.

Barium, metal element, symbol Ba. In group II of the periodic table. The metal is soft and easily cut. It occurs as the sulphate and carbonate in nature. It was first prepared by Sir Humphry Davy in 1808, as an amalgam, by electrolysis of barium chloride. The pure metal was not isolated until 1901.

Barium meal. Barium sulphate is opaque to X-rays and before taking X-ray pictures of the alimentary canal radiologists give a "barium meal" to the patients so that the alimentary canal shows up more clearly.

Barnacles constitute a sub-class (*Cirripedia*) of the Crustacea. The barnacle fouling the bottom of ships is the Goose Barnacle, which has a long muscular stalk and a shell composed of five plates. The Acorn Barnacles, which cover rocks, breakwaters, etc., just below high-water mark are similarly constructed, but have no stalk. The manner of feeding of barnacles was vividly described by T. H. Huxley, who said the barnacle is "a crustacean fixed by its head kicking the food into its mouth with its legs." It was a naval surgeon, J. Vaughan Thompson, who discovered in 1830 that barnacles have a free-swimming larva (or nauplius). In the Middle Ages a curious myth grew up to the effect that the Barnacle changed into a sea-bird called, for that reason, the Barnacle Goose.

Barometer is an instrument for measuring atmospheric pressure, invented at Florence by Torricelli, pupil of Galileo, in 1644. The standard method consists of balancing the air column against a column of mercury, used on account of its high density. The mercury is

contained in a long glass tube, closed at one end, and inverted in a cistern also containing mercury. The height of the mercury column, supporting the air column, is taken as the pressure at the time, and can be read off very accurately by means of a vernier scale. Present-day tendency is to express the readings in units of pressure instead of length, the millibar being adopted (1 mb = 1000 dynes per sq. cm.; 1000 mb ≡ 29·53 inches of mercury approx.). The standard instrument is correct for pressures at 0° C. in Lat. 45°, so that corrections have to be applied for temperatures and latitudes other than these. Also a correction has to be made for reducing the pressure to mean sea level. *See* Aneroid.

Baron, title given in feudal England to a man who held his land directly from the king by military or other honourable service. The first baron created by letters patent was John Beauchamp de Holt, Baron of Kidderminster, in 1387. A baron is a member of the fifth and last grade of the peerage of the United Kingdom and is addressed as "Lord." Life peers and life peeresses rank with hereditary barons and baronesses according to the date of their creation. In Scotland the term baron is used of the possessor of a fuedal fief, or the representative by descent of such a fief. The equivalent of the English baron, as a rank of the Scottish peerage, is Lord of Parliament.

Baronet, the lowest hereditary title, instituted by James I. to provide funds for the colonisation of Ulster. The first baronet was Sir Nicholas Bacon. Since 1964 no recommendations for hereditary honours have been made.

Baroque, a term used for the art style of the period *c.* 1600–1720 which was the artistic accompaniment of the Jesuit counter-Reformation. Its most obvious characteristics are: (*a*) its emotional appeal and dramatic intensity both related to its deliberate intention as propaganda ("a good picture makes better religious propaganda than a sermon" said one of its exponents); (*b*) in architecture, a style which is heavily and sometimes almost grotesquely ornate, plentifully covered with voluptuous sculpture on which draperies float rather than hang, with twisted and spiral instead of plain or fluted columns, and unnecessary windows or recesses added for ornament rather than use; (*c*) its emphasis on the whole at the expense of the parts such that a building's sculpture merges into its architecture and both into its painting (Baroque paintings are as closely knit as a jig-saw puzzle so that one cannot isolate individual figures as would be possible in a Renaissance one). Baroque architecture owing to its origin is found mainly in the Catholic countries; Italy, France, Austria, Bavaria, *e.g*, the Barberini Palace, Rome, designed by its greatest exponent Bernini and others; the Church of the Invalides, Paris. Baroque artists include Caravaggio, Guido Reni, Murillo and Rubens, the greatest Northern Baroque painter. The Baroque style merges gradually into Rococo (*q.v.*).

Barque, a small sailing vessel with three or four masts. A three-masted barque has fore- and mainmasts square-rigged, the mizzenmast fore-and aft-rigged.

Barrow is an ancient artificial mound of earth or stone raised over the site of a burial. In Britain barrows were built from 2500 B.C. until the late Saxon period, but the Egyptian are the earliest barrows known, the great pyramids being a spectacular development of the custom of ceremonial burial. Silbury Hill, south of Avebury, is the biggest artificial mound in Europe, 1680 ft. in circuit at the base, 315 ft. at top, and 135 ft. high.

Bartholomew, Massacre of St., occurred in Paris on the night of Aug. 24, 1572, when over two thousand Huguenots were massacred by order of the Catholic French Court.

Basalt Rocks are fine-grained, dark coloured, of igneous origin and occur either as lava flows as in Mull and Staffa, or as intrusive sheets, like the Edinburgh Castle Rock and Salisbury Craig. One of the most noted examples of columnar basalt is that of the Giant's Causeway in Ireland.

Basanite, A smooth black siliceous mineral, or flinty jasper; a crypto-crystalline quartz, sometimes styled the Lydian Stone. An alloyed metal being rubbed across basanite, the mark of colour left will indicate the nature and depth of the alloy, hence it obtains its name, which signifies, in Greek, "a touchstone."

Base, a substance having a tendency to accept a proton (H^+). This is a wide definition and covers unconventional types of compounds. In aqueous solution bases dissolve with formation of hydroxyl ions, and will neutralise an acid to form a salt. In non-aqueous solvents, like liquid ammonia or hydrogen fluoride, compounds classically regarded as salts can be bases, *e.g.*, sodium fluoride is a base in hydrogen fluoride solution.

Basilisk, is a lizard of aquatic habits, with an elevated crest (which it can erect or depress at will) down the centre of its back.

Basques, people of N. Spain and S.W. France, oldest surviving racial group in Europe, who have preserved their ancient language which is unrelated to any other tongue.

Bas-Relief ("low relief"), a term used in sculpture to denote a class of sculptures the figures of which are only slightly raised from the surface of the stone or clay upon which the design is wrought.

Bastille, a castle or fortress in Paris, built in the 14th cent., and used as a state prison, especially for political offenders. Its bad repute as an instrument of despotism excited the hatred of the populace, who stormed and demolished it on July 14, 1789, at the beginning of the Revolution.

Bastinado, an oriental punishment, by beating with a pliable rod or cane on the soles of the feet.

Bats. These mammals fly by means of a membrane stretched between each of the long fingers of the hand and between the fifth finger and the body. Another membrane stretches between the legs and the tail. There are twelve British species; namely, the Noctule, Leisler's B., Serotine, Pipistrelle, Long-eared B., Daubenton's B., Natterer's B., Whiskered B., Bechstein's B., Barbastelle, Greater Horseshoe, and Lesser Horseshoe Bats. Bats echo-locate obstacles by means of supersonic sound waves; this explains their ability to fly perfectly at night and in dark woods and caves. Blindness does not affect this ability but deafness leaves them comparatively helpless. Bats are mostly insectivorous, catching the insects in their open mouths while flying; some eat fruit. The Vampire Bats, feeding exclusively on blood, are confined to tropical America.

Bath, Order of the, believed to have been established by Henry IV. at his coronation in 1399; remodelled in 1725 as a military order; formally instituted in three classes in 1815; civil division added in 1847. In the Order are three classes: G.C.B., or Knight Grand Cross of the Bath; K.C.B., or Knight Commander of the Bath; C.B., or Companion of the Bath. Companionship of the Bath does not carry knighthood nor entitle the holder to the prefix "Sir." The motto of the order is *Tria juncta in uno* (Three joined in one). The insignia for civil and military and the three classes vary. *See* Knighthood.

Battery, Electric, the common term for an electric cell but really meaning a combination of two or more cells. A cell is a device for converting stored chemical energy into electricity which can then be used for heat, light, traction, or any desired purpose. A *primary* cell will do this until the chemical action is completed and the cell is then useless. In a *secondary* cell, the chemical actions are reversible and the cell can be returned to its initial condition and used again. This is done by passing an electric current through—a process called recharging. A common primary cell is the Leclanché dry cell used in torches. This works by the action of sal-ammoniac on electrodes made of zinc and carbon. About a century after it came into common use it is still the chief source of power for portable equipment in armed forces. A common secondary cell is the lead and sulphuric acid accumulator used in cars. Many other types of cell are known and some are under development because the demands of space travel, medicine, warfare, etc., call for batteries

of lighter weight, greater reliability, or special properties. *See* **Fuel Cell, Energy Conversion.**

Bauhaus, a German institution for the training of architects, artists, and industrial designers, founded in 1910 at Weimar by Walter Gropius. It was closed by Hitler in 1932 and re-opened at Chicago in 1937 under the name of The Institute of Design. The Bauhaus doctrine held that there should be no separation between architecture and the fine and applied arts: that art, science, and technology should co-operate to create "the compositely inseparable work of art, the great building." The original institution, at the instigation of Gropius, included on its teaching staff not only architects and technicians but also such noted artists as Paul Klee and Wassily Kandinsky.

Bauxite, the chief ore of aluminium. Chemically it is aluminium oxide. Aluminium metal is made industrially by electrolysing purified bauxite dissolved in fused cryolite. Chief producing areas: Surinam, Br. Guiana, U.S.A., France, Hungary, Indonesia, U.S.S.R., Yugoslavia, Italy.

Bayeux Tapestry, a famous tapestry representing the conquest of England by William the Conqueror. It is embroidered on a band of linen 231 ft. long and 20 in. wide in blue, green, red, and yellow, divided into 72 scenes ranging over the whole story of the conquest. The accepted view is that the tapestry was commissioned for Bayeux Cathedral, but a new interpretation is that it is an Anglo-Norman secular work of art, much influenced by the contemporary *chansons de geste* (songs of deeds), executed by English embroiderers for a Norman patron. A representation can be seen in the Victoria and Albert Museum in London.

Beagle, a small hound that tracks by scent, and formerly used for hare hunting.

Bears belong to the Ursidae family of the Carnivora. They are plantigrade mammals, walking (like man) on the soles of their feet. Found in most parts of the world except Australia. The common Brown Bear was once spread over the whole of Europe; it became extinct in England about the 11th cent.: 7–8 ft. in length, and stands 3 ft. or more at the shoulder. The Grizzly Bear of N. America is larger, and the coat is shorter and greyer. The Polar Bear is remarkable in having a white coat all the year round; it spends much time in water, and unlike the other bears it is entirely carnivorous. Bear-baiting was made illegal in England in 1835.

Beat Generation. *See* **J5.**

Beaufort Scale of wind force is used to specify numerically the strength of the wind. Since the introduction of anemometers to measure the actual velocity, equivalent values of the ranges in miles per hour at a standard height in the open have been assigned to the Beaufort numbers. *See* **N33.**

Beaver, a genus of mammals of the Rodentia order, with short, scaly ears, webbed hind feet, and a long broad scaly tail. They grow up to 4 ft. long, and live in communities, constructing dams and lodges where they breed. Found in N. America, Russia, and Poland. Valuable commercially for their fur.

Bedford Level comprises parts of Norfolk, Suffolk, Huntingdon, Northampton, Lincoln, and Cambridge, generally called the Fens, 70 miles long and 20 to 40 miles broad. It was reclaimed and drained in the 17th cent. by the Earl of Bedford and the Dutch engineer Cornelius Vermuyden.

Bedlam (a corruption of Bethlehem) was a priory in Bishopsgate, afterwards converted into a hospital for lunatics. The asylum was transferred to St. George's Fields, Lambeth, in 1815. The term "bedlamite" came to be applied to any person behaving like a madman.

Beech, a deciduous tree belonging to the genus *Fagus* of some eight or nine species found in north temperate regions. The common beech, *F. sylvatica*, is believed to be native to Britain and is one of our finest trees, with massive trunk, long, pointed winter buds, and smooth, grey bark. There is little undergrowth under its dense shade. It is shorter lived than the oak, taking about 200 years to reach full size and then declining. The timber of beech has a variety of uses, *e.g.*, spoons, handles, tools, and chairs.

Bee-eater, name of a family of brilliantly coloured birds closely related to the rollers and kingfishers inhabiting the tropical and sub-tropical parts of Africa, Asia and Europe. The European species successfully nested in Britain for the first time in 1955 and a pair nested in Alderney in 1956. With their long curved beaks they catch insects on the wing, especially bees and butterflies, and lay their eggs in dark nest tunnels.

Beefeater. *See* **Yeomen of the Guard.**

Beeswax, the secretion of the bee, used for the formation of the cells or honey-comb of the hive; when melted it is what is commercially known as yellow wax, white wax being made by bleaching. Being impervious to water, it acts as a good resistant and is an article of much utility.

Beetles (Coleoptera) constitute one of the biggest orders of insects, numbering over 200,000 species. There are two pairs of wings; the hind pair are used for flight, while the front pair are hardened to form a pair of protective covers (elytra). Some beetles have lost the power of flight and then the elytra are joined together.

Bel and the Dragon is the title of certain supplementary chapters to the "Book of Daniel" of an apocryphal character. First appeared in the Septuagint, but the Jewish Church did not accept it as inspired. In 1546 the Council of Trent declared it to be canonical.

Bell, a hollow body of metal used for making sounds. Bells are usually made from bell-metal, an alloy of copper and tin. Small bells used for interior functions are often made of silver, gold, or brass. Ordinary hand-bells are of brass. From the 7th cent. large bells have been used in England in cathedrals, churches, and monasteries. The greatest bell in the world is the "King of Bells" in the Kremlin at Moscow which weighs about 198 tons, is 20 ft. 7 in. high and 22 ft. 8 in. in diameter. It was cast in 1733, but cracked in the furnace (the broken part weighed 11 tons) and is now preserved as a national treasure. Other large bells in Russia, include the 171-ton one at Krasnogvardersk, near Leningrad, and the one of 110 tons at Moscow. The Great Bell (Great Paul) at St. Paul's, cast in 1881, weighs 16¾ tons, and is the largest in the United Kingdom. Other gigantic bells are the Great Bell at Peking (53 tons); Nanking (22 tons); Cologne Cathedral (25 tons); Big Ben, Westminster (13½ tons); Great Peter, York Minster (10 tons). The Curfew bell is rung in some parts of England to this day, notably at Ripon. The number of changes that can be rung on a peal of bells is the *factorial* of the number of bells. Thus four bells allow 24 and eight bells 40,320.

Belladonna *or* **Deadly Nightshade** (*Atropa belladonna*) a well-known poisonous wild plant found in Southern Europe and Western Asia. The alkaloid atropine it contains is valuable in medicine, although a large dose is poisonous.

Bell, Book, and Candle. To curse by "bell, book, and candle" was a form of excommunication in the Roman Church ending with the words: "Do to the book, quench the candle, ring the bell."

Benedicite, the canticle in the Book of Common Prayer, known also as "The Song of the Three Holy Children."

Benedictines are monks and nuns of the Benedictine Order who live under the rule of St. Benedict—the monastic code whose influence on the religious and cultural life of the West has been so powerful. The rule is marked by an absence of extravagant asceticism. The greatest of the early Benedictines was Pope Gregory I (590–604) who sent St. Augustine of Canterbury to Anglo-Saxon England. Gregorian plainsong is named after him. *See also* **J30(1).**

Benedictus, a canticle used in the morning service of the English Church, and deriving its name from the first word of the Latin verse, *Benedictus*, blessed.

Benzene. An aromatic hydrocarbon obtained from coal tar and some petroleum fractions. It is a volatile inflammable liquid with a characteristic smell. The molecule consists of a flat ring of six carbon atoms, each bound to one hydrogen atom. Benzene is the parent member of many aromatic organic compounds and is

widely used in industry to synthesise intermediates for fibres, dyestuffs, explosives, and pharmaceutical chemicals.

Bergamot, an essential oil obtained from the rind of a species of citrus grown chiefly in Calabria, and largely used in perfumery. Also a hardy herbacious perennial.

Beryl, a mineral, of which the emerald is a grass-green variety. Composed of beryllium and aluminium silicates. The pure mineral is colourless; the colour of most beryl comes from traces of impurities, notably iron and chromium. Otherwise it is yellowish, greenish-yellow, or blue, and is found in veins which traverse granite or gneiss, or embedded in granite, and sometimes in alluvial soil formed from such rocks.

Beryllium. Metallic element, symbol Be. Very similar to aluminium, it is stronger than steel and only one-quarter its weight. It is not very abundant, its main source is the mineral, beryl. Copper containing 2% beryllium is used for making springs. Because of its special properties the metal is used as a component in spacecraft, missiles and nuclear reactors. This accounts for its recent development on a technical scale. The metal powder is toxic.

Bessemer Process, for making steel depends on the forcing of atmospheric air into molten pig iron to burn out the impurities. *See* **Steel.**

Betel, the leaf of an Indian climbing plant, of pungent, narcotic properties. It is destructive to the teeth, and reddens the gums and lips.

Bhang, the Indian name for the hemp plant *Cannabis sativa*, the leaves and seed-capsules of which are chewed or smoked. The potent drug which comes from flowers of the female plant is called hashish in Arabia and marihuana in the United States and Mexico. *See* **P23(2).**

Bible—The Old Testament and the New Testament. The Old Testament—the prehistoric portion—consists of 39 books, and is divided into three parts: (1) the Law, (2) the Prophets, (3) Miscellaneous Writings. The Old Testament was written in Hebrew except for parts of Ezra and Daniel, which were in Aramaic. It was not until the 9th cent. A.D. that a complete Hebrew text was made, the so-called Massoretic text. Before that the main versions were the Alexandrian Greek translation (Septuagint) made in the 2nd cent. B.C. and St. Jerome's Latin Vulgate of the 4th cent. A D. Portions were translated into the Anglo-Saxon in the 8th cent. and the Venerable Bede put the greater part of St. John's gospel into English, but it was not until 1535 that a complete printed English version appeared—the Coverdale Translation. The Authorised Version dates from 1611 in the reign of James I., and because of its beautiful phraseology it has had a lasting appeal. The Revised Version dates from 1885. A new translation of the Bible in the English language of today is in progress (*The New English Bible*); the New Testament was published in 1961 and the Old Testament and the Apocrypha will be ready later. The finding of the Dead Sea Scrolls (since 1947) has added to our knowledge of Scripture.

Billion, in English usage, a million million, or 10^{12}; in American and French usage, a thousand million, or 10^{9}.

Bill of Rights, or Declaration of Rights, was the document setting forth the conditions upon which the British throne was offered to William and Mary in 1688. This was accepted and ultimately became an Act of Parliament.

Binary Notation, for numbers, is a way of representing numbers using only two digits, 0 and 1. Electronic digital computers handle numbers in this form and many people these days are having to learn it. Many school children find it both easy and fascinating—as did the great philosopher and mathematician Leibniz. The ordinary, or decimal numbers, 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10 are written in binary notation as follows: 0, 1, 10, 11, 100, 101, 110, 111, 1000, 1001, 101. The reader might divine the rules from this. The point is that you "carry 1," *i.e.*, move the digit 1 a place to the left, when you reach 2. In decimal notation you move 1 a place left when you reach 10. In other words, instead of columns for units, tens, hundreds, thousands, etc., the columns are for units, twos, fours, eights, etc. In binary notation: "1+1 = 0 with 1 to carry." Since every digit in binary notation is either 0 or 1 it requires one bit of information to specify a binary digit. *See* **Bit.**

Biological Warfare, is the use for warlike purposes of bacteria, viruses, fungi, or other biological agents. These can be used to spread distress, incapacity, disease, or death among the enemy's people or livestock. One of the strange uses to which mankind puts its science is to make naturally infective organisms even more virulent for military use. This sort of research can be done in many countries; it is much cheaper and easier to hide than nuclear weapons development. Secret attack by biological agents is supposed to be easy and it may affect the populations without damaging buildings or bridges. However, the true effectiveness of biological warfare is largely unknown—meteorological conditions alone might render an attack completely unreliable. *See also* **C26(2).**

Birch, a genus of deciduous trees including about 40 species and found only in northern regions. Birches native to Britain, and to Europe generally, are of two species—the silver birch, *Betula pendula*, with its graceful, drooping branches and triangular leaves, and the white birch, *Betula pubescens*, which has erect branches and soft oval leaves. Birch timber is an important plywood timber, the bark is used for tanning leather, and wintergreen oil comes from the bark of black birch, *Betula lenta*, a North American species. The birch is not a long-lived tree, few standing for more than a hundred years. The tallest recorded is at Woburn in Bedfordshire, 102 ft. high.

Birds, or Aves, are, next to mammals, the highest class of animal life. There are two kinds of modern birds—*Carinatae*, possessing keeled breast-bones and having power of flight; *Ratitae*, having raft-like breast-bones, and incapable of flight; and a sub-class of fossil birds, Archaeornithes, including *Archaeopteryx*. It is estimated that there are about 120 million land birds breeding in Great Britain, including 10 million each of the chaffinch and blackbird, 7 million each of the starling and robin and about 2 million sparrows.

The wheatear is usually the first of the migratory birds to return, often reaching Britain at the end of February and always before the middle of March; the sand martin is the first of the "early swallows" to return, followed by the house martin. The first cuckoo arrives about the middle of April, and the whinchat, garden warbler, and sedge warbler during the last week in April. The nightjar, spotted flycatcher, and red-backed shrike are not seen until the first week in May. The swift is among the last to return from Africa and the earliest to depart. Bird-nesting is illegal in Britain. *See also* **F26, Z21.**

Birds of Paradise, over 40 species of tropical birds inhabiting the dense forests of New Guinea and neighbouring islands. The male birds are remarkable for their brilliant plumage, long tail feathers, and ruffs on wings and neck, which are displayed to advantage during courtship. Related to the Bower Birds of Australia, and crows.

Biretta, a four-cornered head-covering worn by ecclesiastics of the Roman Church and varying in colour according to the rank of the wearer. A cardinal's biretta is red, a bishop's purple, a priest's black.

Bise, a keen dry north wind prevalent in Switzerland and South France.

Bishop is a Christian ecclesiastic, a person consecrated for the spiritual government of an area, a diocese or province, to the spiritual oversight of which he has been appointed (diocesan bishops), or to aid a bishop so appointed (suffragan bishops). In the Church of England there are forty-three diocesan bishops, all nominated by the Crown. Two, Canterbury and York, are archbishops having primacy in the respective provinces. The archbishops of Canterbury and York and the bishops of London, Durham, and Winchester and twenty-one other diocesan bishops in the order of seniority are spiritual peers, and sit in the House of Lords. The (Disestablished) Church of Ireland

has two archbishops and twelve bishops; the (Disestablished) Church of Wales an archbishop and five bishops and the Episcopal Church in Scotland seven bishops. *See also* Cardinal.

Bismuth, metallic element, symbol Bi, in group V of the periodic table. Like antimony, the stable form is a grey, brittle, layer structure; electrical conductor. It is readily fusible, melting at 264° C. and boiling at about 1420° C. Wood's metal, an alloy with one of the lowest melting points (under 150° F., so that a spoon made of it will melt when placed in a cup of hot tea), contains four parts bismuth, two parts lead, one part tin, one part cadmium.

Bison, a genus of wild cattle, distinguished from the ox by its shorter, wider skull, beard under the chin, high forequarters, and, in winter, a great mane of woolly hair covering head and forequarters. There are two species, the European and the American bison, both now protected in game preserves.

Bit, formerly the word often referred to the metal piece in the mouth of a bridled horse, now more likely to be a technical expression in the mouth of a computer expert. A bit is a unit of information; it is the information that can be conveyed by indicating which of two possibilities obtains. Any object that can be either of two states can therefore store one bit of information. In a technical device, the two states could be the presence or the absence of a magnetic field, or of an electric voltage. Since all numbers can be represented in the binary system (*see* Binary Notation) by a row of digits which are *either* 0 *or* 1, it takes one bit of information to specify a binary digit. Bit is short for binary digit.

Bittern, a bird of the heron genus, with long, loose plumage on the front and sides of the neck. It is a solitary bird inhabiting marshes, but rare in Britain.

Bivalves, shell-fish whose shell consists of two hinged valves, lying one on each side of the body, such as mussels, oysters, and cockles.

Blackbird, or Merle, a member of the Thrush family, a familiar song bird in Britain. Male is all-black with orange bill; female is mottled brown with brown bill; the young are spotted brown.

Blackcock and Greyhen (as the female is called) are closely related to the Capercaillies but smaller. They nest on the ground and prefer wooded country to open moors. Found in northern half of northern hemisphere. Polygamous, they perform excited courtship dances; the male is a handsome blue-black bird with white undertail, the female dark brown mottled.

Black Death, the plague which swept across Europe in the years 1348–50, beginning in the ports of Italy, brought in by merchant ships from Black Sea ports. It was the worst scourge man has ever known; at least a quarter of the European population was wiped out in the first epidemic of 1348. It reached England in the winter of that year. The disease was transmitted to man by fleas from black rats, though this was not known at the time, the specific organism being *Bacillus pestis*. The disease continued to ravage Europe in recurrent outbreaks up to the late 17th cent. The epidemic which raged in England in 1665 wiped out whole villages and one-tenth of London's population of 460,000. Samuel Pepys wrote a grim account of it in his *Diary*. *See also* Labourers, English Statute of.

Black Hole of Calcutta, the name given to the place where a captured British garrison was confined in 1756, during the struggle for India between the French and British. Into a noisome space, about 20 ft. square, 146 persons were driven and only 23 were found alive the next morning. The authenticity of the story has been called into question, but after sifting the evidence Professor H. H. Dodwell, in the *Cambridge History of the British Empire*, believes it to be substantially true.

Black-letter, the Old English or Gothic type first used in printing blocks.

Black Woodpecker (*Dryocopus martius*), a large, black bird about the size of a rook, with slightly crested scarlet crown, found in many parts of Europe.

Blenny, a group of marine fishes with spiny rays part of the fin running along the back. Several species are found around the British coast.

Blood Groups. *See* Index to Section P.

Bloody Assizes, the assizes, conducted in 1685 by George Jeffreys, Lord Chief Justice, at which participants in the Duke of Monmouth's rebellion against King James II. were tried. They were marked by relentless cruelty.

Bluebird, a migratory bird of North America, deriving its name from its deep blue plumage. It is one of the few song birds of America, and familiar in the woods from early spring to November. In India and Malaya there is the Fairy Blue-bird; the male is black with shiny blue upper parts. The bluebird was used as the symbol of happiness by Maeterlinck in his play *The Blue Bird*.

Blue Peter, a blue flag with a white square in the centre, is hoisted 24 hours before a ship leaves harbour (the letter P in the alphabet of the International Code of Signals).

Blue Ribbon, a term in general use to denote the highest honour or prize attainable in any field or competition. Thus the Derby is the blue ribbon of the turf. The expression is derived from the highest Order of Knighthood in the gift of the British Crown, the insignia of which is a garter of blue velvet.

Blue Stocking, a term used to describe a learned or literary woman, particularly if pedantic and undomesticated. It is said that the term derives from the Bas-Bleu club of Paris, which was attended by the literary savantes of the 17th cent. In England a similar literary club was formed about 1780, whose members were distinguished by their blue stockings.

"Blue" Sun, Moon, etc., a phenomenon caused by the scattering of sunlight by transparent particles suspended in the atmosphere, the effect being that blue light is transmitted and red light extinguished to direct vision. The dust from the Krakatoa eruption in 1883 and the drifting layer of smoke from the forest fires in Alberta, Canada, in September 1950 gave rise to "blue" moons and suns, phenomena sufficiently rare to be described as occurring "once in a blue moon." In the cold climatic conditions of the Pamirs and the far north, vegetation is said to look "blue" on account of the rays of high calorific value (red, yellow, green) being absorbed, while only the blue and violet are transmitted. It was Tyndall who first explained the blue colour of the sky.

Boa, a term applied to a family of snakes of large size, some attaining a length of 30 ft. They are not poisonous, but kill their prey by crushing—constriction—hence the name "boa constrictor." They occur both in the Old World and the New, but are more abundant in the latter. Most Boas retain the eggs within the body until young are fully developed, whereas the Pythons almost all lay leather-shelled eggs.

Boar, or Wild Hog, an animal largely distributed over the forest regions of Europe, Asia, Africa, and South America. It has a longer snout and shorter ears than its descendant the domestic hog, and is provided with tusks. Having to forage for itself, it is a more active and intelligent animal than the pig of the sty, and offers good sport to the hunter.

Boat, an open vessel, propelled by oars or sails, or both. The boats of a ship of war are the launch, barge, pinnace, yawl, cutters, jolly boat, and gig; of a merchant vessel, the launch, skiff, jolly boat or yawl, stern boat, quarter-boat, and captain's gig. Every ship is compelled to carry adequate, fully provisioned and equipped lifeboats.

Bode's Law, a numerical relationship formulated by Bode in 1772, which states that the relative mean distances of the planets from the sun are found by adding 4 to each of the terms 0, 3, 6, 12, 24, 48, 96. The actual mean distances (in millions of miles) are: Mercury, 36; Venus, 67·2; Earth, 92·9; Mars, 141·6; Jupiter, 483·3; Saturn, 886·0; Uranus, 1782·8. The gap between Mars and Jupiter caused Bode to predict the existence of a planet there, which was later confirmed by the discovery of Ceres and other minor planets. The law breaks down, however, for Neptune and Pluto.

Boer War, lasted from Oct. 11, 1899, when the Boers invaded Natal, to May 31, 1902, when the Treaty of Vereeniging ended hostilities. At first the operations of the British troops in

Cape Colony were unsuccessful and disastrous reverses were sustained. Lord Roberts was then sent out as Commander-in-Chief, with Lord Kitchener as Chief-of-Staff, and from February, 1900, when Kimberley was relieved and Cronje was compelled to surrender and Ladysmith and Mafeking were relieved, the struggle was practically over.

Boiling-point is the temperature at which a liquid boils. At that point the pressure of the vapour is equal to the pressure of the atmosphere. Under increased pressure the b. p. rises and under less pressure, as on the top of a mountain, it is lower. As represented on the Centigrade scale the b. p. of water is 100°; alcohol 78·4°; and ether, 35·6°. On the Fahrenheit scale, the b. p. of distilled water is 212°. Boiling points are given for a standard pressure (760 millimetres of mercury).

Books, Sizes of. *See* N14.

Books, Classification of. All libraries are classified to facilitate reference, but the favourite system is the Dewey Decimal System, which divides the whole field of knowledge into ten Main Classes: General Works; Philosophy; Religion; Sociology; Philology; Natural Science; Useful Arts and Applied Science; Fine Arts; Literature; History (including geography and travel and biography). Each of these Main Classes is again subdivided into ten main divisions. As an example: the main class of Sociology receives the number 300. This range 300 to 400 (the next main class) is graduated into tens, and Economics is 330. The range 330 to 340 is again graduated, and the subject of Labour and Capital is 331. This process is carried on by decimals so that 331·2 deals with Remuneration for Work, 331·22 with Wage Scales, and 331·225 with Extra Pay.

Borax (Sodium Pyroborate) is a white, soluble, crystalline salt. It is widely and diversely used, *e.g.*, as a mild antiseptic, in glazing pottery, in soldering, in the making of pyrex glass, as a cleansing agent and sometimes as a food preservative. Borax occurs naturally in the salt lakes of Tibet, where it is called tincal, in California (Borax Lake, Death Valley), and elsewhere

Bore. In physical geography, an almost vertical wall of water which passes upstream along certain estuaries. Its formation requires special conditions of river flow, incoming high tide, and shape of river channel. It can be spectacular and dangerous on some rivers. In Britain the best known is the Severn bore which can be a few feet high and move at 10 or 12 m.p.h. In some parts of Britain the bore is called an eagre.

Boron. A metalloid element, symbol B. There are two forms, one crystalline, the other amorphous. It is not very abundant in nature but occurs in concentrated deposits. It is best known in boric acid, which is used as a mild antiseptic (called boracic acid) and borax (*q.v.*). Boron compounds are essential to some plants, *e.g.*, beans. Used in the preparation of various special-purpose alloys, such as impact resistant steel. Compounds of boron and hydrogen are used as rocket fuels.

Borstal, an institution where young delinquents between 15 and 21 on conviction may be sent for detention and reform by a court of quarter sessions or assize. The first was opened in 1902 at the village of Borstal, near Rochester in Kent. Administered by the Home Office.

Boston Tea Party, an incident which occurred on Dec. 16, 1773, on board some tea-ships in Boston Harbour. High taxation imposed by the British Parliament under George III. had caused bitter feelings, and instigated by popular meetings, a party of citizens, disguised as Indians, boarded the tea-ships and threw the tea overboard. This incident was a prelude to the American War of Independence (1775–83).

Bounds Beating, an old Anglo-Saxon custom. The parish clergyman and officials go round the parish boundaries accompanied by boys who beat the boundary stones with long sticks of willow. The ceremony takes place on the Rogation days preceding Ascension Day.

Bourgeoisie, a term used by Marxists to indicate those who do not, like the proletariat, live by the sale of their labour. They include, on the one hand, industrialists and financiers or members of the liberal professions and, on the other, small artisans and shop-keepers who, although their standard of living may not be appreciably higher (and today is often lower) than that of the proletariat, are described as the "petty bourgeoisie." According to the Marxist view of history, the bourgeoisie arose with modern industrialism after it had overthrown the old feudal aristocracy and replaced it as ruling class.

Bow, an instrument for propelling arrows, and, in the days when it was a weapon of war, was usually made of yew or ash, and was about 6 ft. long, with an arrow 3 ft. long. It was the weapon with which Crécy, Poitiers, and Agincourt were won. The cross-bow was Italian and was adopted in France, but did not become popular in Britain.

Bow Bells is the peal of the London church of St. Mary-le-Bow, Cheapside, within sound of which one must be born to be entitled to be called a "cockney." Bow Bells had not been heard since 1939, but they once again rang out over the City of London on Dec. 20, 1961.

Bowdlerize, to expurgate a book. Derived from Thomas Bowdler (1754–1825), the editor of the Family Shakespeare, in which "those words and expressions are omitted which cannot with propriety be read aloud in a family." He treated Gibbon's *History of the Decline and Fall of the Roman Empire* in the same way, omitting "all passages of an irreligious and immoral tendency." Such prudery met with ridicule and hence the words "bowdlerism," "bowdlerist," etc.

Bower Bird, native to Australia and New Guinea and related to the Bird of Paradise, though often less striking in appearance. In the mating season the male builds a "bower" of sticks and grasses for courtship displays and as a playground. The Gardener Bower Bird of Papua makes a lawn in front of his bower and adorns it with bright coloured pebbles and flowers which are replaced as they wither. The female builds her nest away from the bower.

Boycott, a term used in connection with a person that the general body of people, or a party or society, refuse to have dealings with. Originally used when Captain Boycott (1832–97) was made the victim of a conspiracy by the Irish Land League which prevented him making any purchases or holding any social intercourse in his district. He had incurred the League's hostility by a number of evictions.

Brass, an exceedingly useful alloy of copper and zinc. Much brass is about two-thirds copper, but different proportions give different properties. It is harder than copper and easily worked. Brass in the Bible (Matt. x, 9) probably refers to bronze.

Breadfruit Tree (*Artocarpus altilis*), a native of the South Sea Islands; the fruits are a brownish green, about the size of a melon, and contain a white pulpy substance which is roasted before being eaten. The tree grows 40 ft. or more. Captain Bligh's ship *Bounty* was on a voyage to Jamaica carrying a cargo of 1,000 breadfruit trees when the mutiny occurred.

Breeder Reactor, a kind of nuclear reactor (*q.v.*) which besides producing energy by the fission process also produces ("breeds") more nuclear fuel at the same time. A typical reaction is: a neutron induces fission of a U-235 nucleus which breaks up into two medium-sized nuclei and some neutrons; one of the latter then enters a U-238 nucleus turning it into U-239 which then decays radioactively *via* neptunium into plutonium which is useful fuel. There are technical problems in breeder reactors which have delayed their practical use but the "breeding" principle is so valuable that experiments have gone on for many years in, *e.g.*, Scotland and Idaho, and breeder reactors will no doubt increase in importance the more the supply of natural nuclear fuel appears to become depleted.

Breviary (Lat. *breviarium*=abridgment), the short prayer-book of the Roman Catholic Church which gives the Divine Office, *i.e.*, the canonical hours or services. The directions for Mass are in the Missal. The modern Roman breviary is a reformed version of the 11th-cent. breviary and was produced by Pope Pius V. in 1568 in response to a decree of the Council of Trent. All Roman Catholic priests are required to

recite the whole of the breviary services allotted for each day. *See also* **Matins.**

Bridges are structures for continuing a road, railway, or canal across a river, valley, ravine, or a road or railway at a lower level. From early times bridges were made of timber, stone, or brick, and it was not until the 19th cent. that wrought- and cast-iron were used. *Today the materials mostly used are steel and reinforced concrete.* Among the most famous of ancient bridges is that of S. Angelo at Rome, built by Hadrian as the Pons Aelius, A.D. 134. The Rialto bridge at Venice dates from 1588. The Ponte Santa Trinita at Florence, one of the finest Renaissance bridges and deemed the most beautiful in the world, was destroyed by German mines in 1944 but has now been reconstructed just as it was before. The first stone bridge across the Thames was begun in 1176. It had 19 arches and was lined with houses and stood until 1831 when it was replaced by the granite bridge designed by Sir John Rennie. By 1970 this will have been replaced by a new three-span concrete bridge with a six-lane carriageway and two footways. The first cast-iron bridge was at Ironbridge, Madeley, Shropshire, built in 1779 and now in need of repair. Telford's Menai suspension bridge (1825) has since been enlarged but the original design has been maintained. Another example of Britain's supremacy in constructional iron-work was Robert Stephenson's tubular bridge across the Menai Straits (1850), the prototype of all modern plate girder railway bridges. Other famous bridges are the Niagara (suspension), Forth railway bridge (cantilever), London Tower bridge (suspension), Tay bridge in Scotland, Victoria Jubilee bridge across the St. Lawrence at Montreal (an open steel structure), Sydney Harbour bridge, Lower Zambesi bridge, Storstrom bridge in Denmark, Howrah bridge at Calcutta, with the third largest cantilever span in the world, the Volta bridge of Ghana and the Auckland Harbour bridge, both built in recent years, the Verrazano-Narrows bridge spanning New York's harbour from Brooklyn to Staten I., the world's longest bridge, exceeding by 60 ft. the centre span of San Francisco's Golden Gate bridge, until 1964 the world's longest. Britain is engaged in the largest bridge building programme for over a century. The new road suspension bridge across the Firth of Forth, completed in 1964, has the largest single span in Europe (3,300 ft.). The Medway bridge, completed in 1963, is the largest pre-stressed concrete structure of its kind in the world. The Severn and the Tay road bridges were completed in 1966.

Britannia Metal, an alloy of tin, antimony, and copper, harder than pure tin, corrosion-resistant, used for teapots, and jugs (often electroplated).

British Association for the Advancement of Science, The, was founded in 1831 by a group of British scientists under the leadership of Charles Babbage (1792–1871) to stimulate scientific inquiry and promote research in the interest of the nation. Its meetings are held annually in different cities of the United Kingdom. It is divided into sections which include the chief physical and biological sciences, economics, anthropology and archaeology, psychology and education, engineering, forestry, agriculture, and there is also a division for studying the social and international relations of science. Dame Kathleen Lonsdale, F.R.S., the crystallographer, was elected President for 1968, when the meeting was to be held in Dundee. Membership is open to laymen as well as scientists.

British Museum, was created by an Act of Parliament in 1753, when the Sir Hans Sloane collection, which the British Government had ac- [illegible] l for £20,000, was added to the Cottonian [illegible] y and the Harleian Manuscripts. It was [illegible] l to the public in 1759 at Montagu House, [illegible] sbury. The acquisition of the library of George III. (now known as the King's Library) in 1823 made larger premises necessary, and the present building in Great Russell Street was completed in 1847 from designs by Sir Robert Smirke. The great domed Reading Room was opened in 1857, and the Natural History Department was transferred to South Kensington in the eighties. As a museum it is perhaps the most famous in the world, since, apart from its colossal library of books and manuscripts, it has many priceless collections of sculptures, antiquities, prints and drawings, coins and medals. *See also* **Libraries.**

British Railways. The name under which the railways of Britain were unified on January 1, 1948. *Instead of the former four main railway systems six regions were formed:* **London Midland** region (former L.M.S.R.) **Western** (former G.W.R.), **Southern** (formerly S.R.), **Eastern** (southern area of former L.N.E.R.), **N.E.** region (N.E. of former L.N.E.R.), **Scottish** region (Scottish system of the former L.M.S.R. and L.N.E.R.). The most far-reaching change in the modernisation and re-equipment programme since 1955 has been the replacement of steam traction by electric and diesel locomotives. Under the chairmanship of Lord (then Dr.) Richard Beeching the British Railways Board planned a viable railway system by closing uneconomic branch lines, by developing new services on the liner train principle, and by utilising a more limited trunk route system. Under the Labour Government an integrated system of transport is being worked out, embracing rail, road, canals, shipping, etc., itself integrated in the pattern of the country's social and economic needs. A 11,000-mile basic network has been fixed (8,000 route miles previously proposed) and a further 2,500 miles are under review. Unremunerative services necessary on social grounds are to receive a Government subsidy. The name was changed to British Rail in 1964.

British Standard Time, which is one hour ahead of Greenwich Mean Time, was introduced throughout the year in Britain on 18 February 1968. This brought Britain into line with countries in Western Europe where Central European Time, which is the same as British Standard Time, is observed. Previously in Britain, British Summer Time (one hour fast on Greenwich) was observed in the summer months and Greenwich Mean Time in the winter months, clocks being put forward one hour in March and put back one hour in October.

Brocken-spectre or Glory. The series of coloured rings which an observer sees around the shadow of his own head (or an aeroplane in which he is travelling) as cast upon a bank of mist or thin cloud. This effect is produced by reflection and refraction of sunlight in minute water-droplets in the air just as in a rainbow.

Bromine. A non-metal element, symbol Br, member of the halogen family (*q.v.*). It is a red, evil-smelling liquid (Greek *bromos*, a stink). It is an abundant element In the U.S.A. bromide is extracted from sea-water on a large scale. It unites readily with many other elements, the products being termed bromides. Its derivatives with organic compounds are used in synthetic chemistry. Bromoform is a liquid resembling chloroform. Bromides are used in medicine to calm excitement.

Bronze is primarily an alloy of copper and tin, and was one of the earliest alloys known, the Bronze Age in the evolution of tool-using man coming between the Stone Age and the Iron Age. Some modern bronzes contain zinc or lead also, and a trace of phosphorus is present in "phosphor-bronze."

Bubble Chamber. An instrument used by physicists to reveal the tracks of fast fundamental particles (*e.g.* those produced in large accelerating machines) in a form suitable for photography; closely related to the Wilson cloud chamber (*q.v.*), but the particles leave trails of small bubbles in a liquid (often liquid hydrogen) instead of droplets of liquid in a gas; invented in 1952 by the American physicist, Dr. D. Glaser, Nobel Prizeman, 1960.

Buckingham Palace, London residence of British sovereigns since 1837. Originally built for the Duke of Buckingham (1703); bought by George III. in 1762 and remodelled by Nash 1825–36.

Buddhism. *See* **J6.**

Bulk Purchase. Arrangements for bulk purchase involve undertakings by a country, or by some agency within it, to buy from another country specified quantities of its products, either at prices fixed in advance or with provision for adjusting the prices at specified intervals to take

account of general price movements. Such long-term arrangements may be, but need not be, combined with undertakings by the seller to buy specified quantities, or specified values, of the products of the purchasing country in exchange. The purpose of bulk-purchase arrangements is, on the one hand, to provide the seller of the goods in question with assured markets and, on the other, to assure the buyers of needed supplies of their goods.

Buntings, name of a group of finches, seed-eating birds, usually found in open country. The Yellowhammer, Reed Bunting, Corn Bunting, and Cirl Bunting are resident in Britain; the Snow Bunting (which breeds in small numbers in Scotland) and Lapland Bunting are regular winter visitors, and the Ortolan is among the rare visitors.

Butane, a colourless inflammable gas made of carbon and hydrogen; formula C_4H_{10}. Found in natural gas and made as a by-product of oil refining. Butane, like propane (*q.v.*), can easily be liquefied and moved safely in cans and tanks. It is thus useful as a "portable gas supply"; also used in internal combustion fuels.

Byzantine Art developed in the eastern part of the Roman empire after Constantine founded the city of Constantinople (A.D. 330). It has many sources—Greek, Syrian, Egyptian, and Islamic—and reached its zenith in the reign of Justinian (527–65). The major art form was ecclesiastical architecture, the basic plan of which was Roman—either basilican (symmetrical about an axis) or centralised (symmetrical about a point). Arched construction was developed, and the dome became the most typical feature, although, unlike the Roman dome which was placed on a round apartment, the Byzantine dome was placed on a square one on independent pendentives. Frequently small domes were clustered round a large one as in the case of the great church of Santa Sophia (537), the climax of Byzantine architecture. Usually the churches were small and include those of SS. Sergius and Bacchus, Sta. Irene (in Constantinople), S. Vitale in Ravenna, and the much later and larger St. Mark's in Venice. Byzantine art also took the form of miniatures, enamels, jewels, and textiles, but mosaics, frescos, and icons (*q.v.*) are its greatest treasures.

Cacao, *Theobroma cacao*, is an evergreen tree, from 15 to 20 ft. high, growing abundantly in tropical America, West Africa, the West Indies, Ceylon, etc., yielding seeds, called cocoa beans, from which cocoa and chocolate are manufactured. The fruit is 7–10 in. long, hard and ridged; inside are the beans, covered with a reddish-brown skin, which are first fermented, then dried. The trees mature at five to eight years and produce two crops a year.

Cactus, a family of flowering plants numbering about a thousand species adapted to living in very dry situations. The stem is usually fleshy, being composed of succulent tissue, remarkably retentive of water; commonly equipped with sharp thorns which deter animals from eating them. The roots are generally very long, tapping soil water over large area; a "prickly pear" cactus may have roots covering a circular area 25 ft. or more in diameter. The leaves are commonly insignificant or absent, and the stem takes over the photosynthetic leaf function and becomes accordingly flattened to expose greater area to sunlight and air. In some kinds of cactus (*e.g. Echinocactus*) the stem is shaped almost like a sea-urchin.

Cadmium. A metallic element, symbol Cd, chemically similar to zinc and mercury. Used in alloys to lower the melting point, as in Wood's metal with bismuth and tin. Alloyed with copper to make electric cables. Like zinc, it is a protective metal and is used in electro-plating. The cadmium-vapour lamp gives a characteristic frequency used in measuring wavelength.

Caesium, also spelt Cesium, is an alkali metal element, symbol Cs, in first group of the periodic table. It resembles rubidium and potassium and was discovered by Bunsen and Kirchhoff in 1860. It was the first element whose existence was discovered spectroscopically. The caesium atom consists of a heavy nucleus surrounded by 55 electrons, 54 of which are arranged in stable orbits, and one of which, known as the valency electron, is in a less stable orbit surrounding them. Used in the construction of photo-electric cells and as an accurate time standard (atomic clock).

Calcite, the stable, naturally-occurring form of calcium carbonate; very abundant; crystallises in the hexagonal system.

Calcium, a silvery-white metallic element, symbol Ca. It melts at 810° C. and is very reactive. It was discovered by Sir Humphry Davy in 1808, but not until 1898 was it obtained pure, by Moissan. Does not occur as metal in nature, but calcium compounds make up a large part of the earth's crust. Most important calcium sources are marble, limestone, chalk (all three are, chemically, calcium carbonate); dolomite, which is the double carbonate of calcium and magnesium; gypsum, a hydrated calcium sulphate; calcium phosphate and calcium fluoride. Igneous rocks contain much calcium silicate. Calcium compounds are essential to plants and are used in fertilisers. Animals require calcium and phosphorus for bone and teeth formation; deficiency is treated by administration of calcium phosphate. Strontium is chemically similar to calcium, and the radioactive strontium 90 from atomic "fall-out" is therefore easily assimilated by the body.

Calendar, a collection of tables showing the days and months of the year, its astronomical recurrences, chronological references, etc. The Julian Calendar, with its leap year, introduced by Julius Cæsar, fixed the average length of the year at 365¼ days, which was about 11 minutes too long (the earth completes its orbit in 365 days 5 hours 48 minutes 46 seconds of mean solar time). The cumulative error was rectified by the Gregorian Calendar, introduced in Italy in 1582, whereby century years do not count as leap years unless divisible by 400. This is the rule we now follow. England did not adopt the reformed calendar until 1752, when she found herself 11 days behind the Continent.

Calends, the first day of the month in the Roman calendar, when interest fell due, and proclamations as to the order of days were made.

Calorie. Unit of quantity of heat. The "small" or fundamental calorie is the amount of heat required to raise the temperature of 1 gram of water from 14·5° to 15·5° C. This is the gram-calorie used in physics and chemistry. The large Calorie (written with a capital C), commonly used in nutritional connotations, is equal to 1000 small calories and is called the kilogram-calorie.

Calvinism. *See* J7.

Calypso, West Indian song in the form of a doggerel lampoon composed spontaneously and sung to a guitar.

Cambridge University had a sufficiently good teaching reputation to attract Oxford students in 1209, when lectures at their own university were suspended. In 1226 it had a Chancellor who was recognised by King and Pope. The first college to be founded was Peterhouse in 1284. The university was reorganised and granted a Charter of Incorporation by an act of Elizabeth in 1571. The colleges with their dates of foundation are Christ's (1505), Churchill (1960), Clare (1326), Clare Hall (1966), Corpus Christi (1352), Darwin (1964), Downing (1800), Emmanuel (1584), Fitzwilliam (1966), Gonville and Caius (1348), Jesus (1496), King's (1441), Magdalene (1542), Pembroke (1347), Peterhouse (1284), Queens' (1448), St. Catherine's (1473), St. Edmund's House (1896), St. John's (1511), Selwyn (1882), Sidney Sussex (1596), Trinity (1546), Trinity Hall (1350), University (1966). The women's colleges are: Girton (1869), Newnham (1875), New Hall (1954), Hughes Hall (formerly Cambridge T.C.) (1885), and Lucy Cavendish Collegiate Society (1966) (for women research students and other graduates). Women were admitted to degrees (though not allowed to sit for examination) in 1920, and to full membership of the University in 1948.

Camel, a large ruminant quadruped, inhabiting Asia and Africa, where it is largely used as a beast of burden. There are two species—the Arabian camel or dromedary, with only one hump; and the Bactrian, or double-humped

camel. There are no wild dromedaries, and the only wild bactrians occur in the Gobi Desert. The camel is able to go for long periods without water, not, as was formerly believed, because it stored water in its hump, but because of the unique mechanism of its physiology which enables it to conserve water at the expense of not sweating until 104° F. is reached.

Campanile, or bell-tower, is separate from but usually adjoining its parent church. The most famous are in Italy. Giotto's tower at Florence, adjoining the cathedral of Santa Maria del Fiore, is architecturally the finest in the world. Others are at Cremona, the loftiest in Italy (364 ft.) and Pisa (the leaning tower). The magnificent pointed campanile of St. Mark's, Venice, which collapsed in 1902 and has since been rebuilt in its original form, was begun in 902.

Canal, an artificial watercourse used for navigation which changes its level by means of locks. The completion of the Bridgewater Canal in 1761 to take coal from Worsley to Manchester marked the beginning of canal building in industrial Britain. There are some 2,500 miles of navigable inland waterways in Great Britain today, 1,850 miles of which are under the control of the British Waterways Board set up by the Transport Act, 1962. The English network is based on the four great estuaries Mersey, Humber, Severn, and Thames.

Canary, a light, sweet wine from the Canaries and chief export until the grape blight of 1853. Much consumed in Britain from Tudor to Georgian times. Also, a popular cage bird bred from a small finch, *Serinus canarius*. *See* Z22.

Candela, unit of luminous intensity, replacing the former *international candle* as standard. So defined that the brightness of a total radiator, or black body, at the temperature of solidification of molten platinum is 60 candelas per sq. cm.

Candlemas, an English and Roman Church festival in celebration of the Purification of the Virgin when she presented the infant Jesus in the Temple, and deriving its name from the great show of candles made on the day (February 2) in the Roman celebrations.

Canon, a term applied to signify a recognised rule for the guide of conduct in matters legal, ecclesiastical, and artistic, or an authoritative ordinance: thus we have Canonical Scriptures, Canon Law, etc. A Canon is also a dignitary of the Church, usually a member of a cathedral chapter in the Anglican communion, or in the Roman Church a member of an order standing between regular monks and secular clergy.

Canonical Hours were seven in number in the Western Church; Matins and Lauds, before dawn; Prime, early morning service; Terce, 9 a.m.; Sext, noon; Nones 3 p.m.; Vespers, 4 p.m.; Compline, bed-time.

Canonisation, the entering of one of the faithful departed on the list of saints of the Roman Catholic Church, after proof of purity and distinction of life has been accepted. A day is then named for the future keeping of the anniversary of the saint's death. Beatification, by which a person is called blessed, is usually followed by canonisation, but not necessarily.

Canticles, the name given to the scriptural passages from the Bible sung by the congregation in the various Christian liturgies. They are the *Benedicite*, *Benedictus*, *Magnificat*, *Nunc Dimittis*.

Capercaillie, the largest of the grouse family, found in the Scottish highlands and the pine forests and mountainous regions of Northern and Central Europe and Asia.

Capet, the family name of a race of French kings, founded by Hugh Capet in 987 with its collateral branches. Reigned until 1848, except for the period of the French Revolution and Napoleon.

Capitalism. *See* J7.

Capuchins are members of a mendicant order of Franciscans, founded in the 16th cent. with the aim of restoring the primitive and stricter observance of the rule of St. Francis, so called from the capuce or pointed cowl worn by them.

Carat, a term used in assessing the value of gold and precious stones. In connection with gold, it represents the proportion of pure gold contained in any gold alloy, and for this purpose the metal is divided into 24 parts. Thus 24-carat indicates pure gold, and any lesser number of carats shows the proportion of gold contained in the alloy. The carat as a measure of weight is now obsolete, having been replaced by the *metric carat* of 0·2 grams.

Caravan, a band of travellers or traders journeying together for safety across the Eastern deserts, sometimes numbering many hundreds. There are several allusions to caravans in the Old Testament. The great caravan routes of this period from Egypt to Babylon and from Palestine to Yemen linked up with the Syrian ports and so with western sea commerce. Many wars have been fought in the past over their control.

Carbohydrates, group of organic compounds composed of carbon, hydrogen and oxygen, *e.g.*, sugars, starches, cellulose. Play an essential rôle in all living processes. *See* P40.

Carbon, a non-metallic chemical element which occurs in crystalline form as diamonds and graphite; amorphous forms of carbon include charcoal and soot, while coke consists mainly of elementary carbon. The biochemistry of plants and animals largely hinges upon carbon compounds. The study of carbon compounds is called Organic Chemistry. Carbon 14. A radioactive isotope of carbon, with a half-life *c.* 6,000 years, used in following the path of compounds and their assimilation in the body. Also used in determination of the age of carbon-containing materials such as trees, fossils, and very old documents.

Carbonari, members of a secret political society originated in Naples, and at one time very numerous. Their chief aim was to free Italy from foreign rule, and they exerted considerable influence in the various revolutionary movements in the first half of the 19th cent. Their name was adopted from the charcoal-burners (*carbonari*), and their passwords, signs, etc., were all in the phraseology of the fraternity.

Carbon dioxide. Commonest of the oxides of carbon. It is formed when carbon and its compounds are burnt with abundant supply of air, and when carbon compounds are oxidised in the respiration process of animals. The atmosphere contains carbon dioxide to the extent of about three parts in 10,000; this figure remains more or less constant because, while carbon dioxide is always being added by animal respiration and the burning of fuels, such as coal and oil by man, plants are constantly removing it in the process known as photosynthesis or carbon assimilation. A heavy gas and obviously not one capable of supporting respiration, it can accumulate in caves, etc., and cause asphyxiation; for instance, in the Grotto del Cane, near Naples, a dog entering the cave is suffocated, whereas a man whose head is above the carbon dioxide level can walk through it unharmed. Solid carbon dioxide is called "dry ice." The gas in aerated drinks and soda water is carbon dioxide.

Carbon monoxide is a colourless gas with no taste or smell. It is formed when coal and coke are burnt with a restricted supply of air; the blue flame to be seen in a coke brazier, for instance, is the flame of carbon monoxide. This gas is very poisonous, forming with the haemoglobin of the blood a compound which is useless for respiration and cherry red in colour which gives a visible symptom of poisoning by carbon monoxide. With nickel it forms a volatile compound, called nickel carbonyl, and this reaction is the basis of the Mond process for extracting nickel.

Cardinal, one of the chief dignitaries of the Roman Catholic Church who constitute the Pope's council, or Sacred College, and when the papal chair is vacant elect a Pope from among themselves. There are three orders: cardinal bishops, members of the Roman Curia (the central administration of the Church) and bishops of sees near Rome; cardinal deacons, also members of the Curia, holding titular bishoprics; and cardinal priests who exercise pastoral duties over sees removed from Rome, though some are members of the Curia. Their numbers were fixed by Pope Sixtus V in 1586 at 6, 14, and 50 respectively. Both Pope John XXIII and Pope Paul VI increased the number and since 1967 there have been 120, the highest number in the history of the Church.

Cardinal Virtues, according to Plato these were justice, prudence, temperance, fortitude—

natural virtues as distinct from the *theological* virtues of the Roman Catholic Church, faith, hope, charity. The phrase "seven cardinal virtues," combining the two, figures in mediæval literature. *See* **Sins, Seven Deadly.**

Carlovingians, the second dynasty of the French kings (established 751), included such notable rulers as Charles Martel and Charlemagne. In 987 the Capet dynasty succeeded.

Carmelites, a body of mendicant friars taking their name from Mount Carmel, where the order was first established in the 12th cent. The original rule of the order required absolute poverty, abstinence from meat and a hermit life. The rigidity of the rule of the order was mitigated by Innocent IV. They wear a brown habit with white mantle, hence their name of White Friars. The order of Carmelite nuns was instituted in the 15th cent.

Carp, a well-known fresh-water fish, found in plenty in most European and Asiatic still waters; reaches a length of about 2 ft. and under favourable conditions lives for about 40 years. Familiar British members of the family are the roach, rudd, dace, chub, gudgeon, tench, minnow, barbel, bream and bleak. The goldfish, popular in ornamental ponds, is the domesticated variety of a Far Eastern member of the carp family.

Carthusians, an order of monks founded in 1084 by St. Bruno at the Grande Chartreuse near Grenoble, and introduced into England about a century later. They built the Charterhouse (corruption of Chartreuse) in London in 1371 The chief characteristics of the order are a separate dwelling-house in the precincts of the charterhouse for each monk, and the general assembly in the Church twice in the day and once at night. They wear a white habit, with white scapular and hood. The liqueur *Chartreuse* was invented by the order and is still their secret. For many years they have derived large revenues from its sale. The order of Carthusian nuns was founded in the 12th cent.

Casein, the chief protein in milk and cheese. It is coagulated by the action of rennet or acid. An important class of plastics ("casein plastics") are produced from it, and these plastics are converted into buttons, knitting-needles, etc. 8000 gallons of milk yield about a ton of casein.

Cassowary, a genus of ostrich-like birds which, together with the emu, form a separate order found only in Australasia. All species are black, with brightly coloured necks, and with a horny crest on the head. Noted for fleetness.

Castor-oil Plant (*Ricinus communis*), an African shrub now cultivated in most tropical countries. It has broad palmate leaves and bears a spiny fruit containing seeds which when pressed yield the well-known oil.

Cat, the general name for all members of the class *Felidae* of the carnivorous order, from the lion down to the domestic cat. The latter is believed to be descended from the European and African wild cats. Egypt is credited with having been the first country in which the cat was domesticated. *See* **Z9–12.**

Catabolism, Anabolism, are the terms used to describe the two types of metabolic pathway. Catabolic pathways are routes by which large organic molecules are broken up by enzymes into their simpler constituents *e.g.*, starch into glucose. The anabolic pathways are the routes by which complex molecules are synthesised from simple sub-units, *e.g.*, proteins from amino acids.

Catalyst. A substance which speeds up a chemical reaction without being changed itself. Various aluminium and titanium compounds are catalysts in the formation of polythene from ethylene. Palladium catalyses the reaction of hydrogen with oxygen (hence its use in gas lighters). Enzymes in the body hasten the breakdown of carbohydrates and proteins by catalytic action.

Cataracts are gigantic waterfalls. The most famous are those of Niagara in North America, the Orinoco in South America, the Victoria Falls on the Zambesi in Africa, the Falls of the Rhine at Schaffhausen, and the Cascade of Gavarni in the Pyrenees.

Catechism, an elementary book of principles in any science or art, but more particularly in religion, in the form of questions and answers. There is a great variety of these, including the Lutheran, prepared by Luther in 1529, Calvin's Geneva (in 1536), and the Anglican, in the Book of Common Prayer.

Catechumens, a term applied in the primitive Church to children of Christian parents, who were admitted as neophytes, and occupied a place apart in the church.

Catenary, the name of the curve taken up by a flexible uniform chain or clothes line supported at its two ends.

Caterpillar, the larva of a butterfly or moth, worm-like in its segmented body, with 3 pairs of jointed true legs often curiously marked and coloured, and frequently more or less hairy.

Cathedral, the chief church of a diocese, so called from its containing a Bishop's seat, or episcopal chair. The town in which it is situated is a cathedral city. Some celebrated cathedrals are St. John Lateran of Rome, Notre Dame of Paris, the cathedrals of Cologne and Milan, St. Paul's in London, Canterbury Cathedral, York Minster, and the cathedrals of Durham, Bristol, Gloucester, Peterborough, Exeter, Liverpool, and Coventry (destroyed by bombs, now rebuilt).

Catholicism. *See* **J7.**

Cat's-eye, a kind of quartz, much valued as a gem, opalescent, and of various shades.

Cavalier, a name adopted during the troubles of the Civil War to designate the Royalist party; it is also used generally in reference to a knightly, gallant, or imperious personage.

Caves, natural hollow places in the earth, frequently found in limestone, less frequently in volcanic rocks. Popular caves in Britain are Kent's cavern near Torquay, Cheddar and Wookey hole in the Mendips; Fingal's Cave in Staffa (Inner Hebrides) is noted for its splendid range of basalt columns. The scientific study of caves is known as spelaeology. The first discovery of Palæolithic paintings (the celebrated bulls) was made in the Altamira caves in Spain in 1879.

Cedar, a dark-leaved, cone-bearing, horizontal-branched evergreen tree that grows to a considerable height and girth, the best known species in Britain being the Lebanon Cedar, which was introduced in the 17th cent.

Celluloid, one of the first synthetic thermoplastic materials, discovered by Alexander Parkes in 1865 when he was attempting to produce synthetic horn. It is made by treating cellulose nitrate with camphor and alcohol. Photographic film is made of a similar, but less-inflammable material, formed by the use of cellulose acetate instead of the nitrate.

Cellulose, a carbohydrate, and a constituent of nearly all plants. Cellulose occurs in an almost pure state in the fibres of linen (flax), absorbent cotton, jute, and filter-paper (used in laboratories).

Celsius was an 18th cent. Swedish scientist (B17) after whom the modern Celsius temperature scale is named. Since 1954, °C stands for "degree Celsius" instead of "degree Centigrade" but this is only a change in name. Both symbols refer to the temperature scale which calls the melting point of ice 0°C and the boiling point of water at one atmosphere pressure 100°C. *See* **Absolute Temperature.**

Celts, an ancient race of W. Europe, originally from southern Germany (2nd millennium B.C.), united by a common language and culture, who spread westward into Spain, northward into Britain, eastward to the Black Sea, reaching Galicia in Asia Minor. The "La Tène" iron age Celts invaded Britain 250 B.C. After Britain was conquered by the Romans and invaded by the Angles and Saxons there remained as areas of Celtic speech only Wales (Brythonic speakers), Ireland, Scotland, Isle of Man (Gaelic speakers). The late Celtic period in Britain produced a distinctive Christian art (*e.g.*, the Lindisfarne Gospel *c.* 700, and the Irish Book of Kells, dating from about the same time).

Centrifuge, a machine which produces large accelerations by utilising the radial force caused by rotating a body about a fixed centre. Centrifuges have found extensive application in modern science. They can be used for the separation of one size of particle from another (for this use in biochemistry see F20) or in the training of astronauts where the accelerations

occuring during rocket lift-off can be simulated in a centrifuge on the ground.

Ceramics, are substances in which a combination of one or more metals with oxygen confers special and valuable properties. These include hardness, and resistance to heat and chemicals. Ceramic comes from the Greek word for pottery, and pottery materials of mud and clay were probably the first man-made ceramics. Nowadays the range is enormous and growing; apart from all the pottery materials, there are fire-bricks, gems, glasses, concretes, nuclear reactor fuel elements, special materials for electronic devices, coloured pigments, electrical insulators, abrasives, and many other things. The scientific study of ceramics is part of materials science (*see* **Materials Science**). The need to design ceramic objects has inspired great art, and the production of ceramics is a major industry.

Cerium, a scarce metallic element discovered by Berzelius in 1803 A mixture of cerium and thorium nitrates is used in the manufacture of gas mantles, which owe their incandescent property to the deposit of cerium and thorium oxide with which they are coated.

Chain reaction. *See* F12(1).

Chalcedony, a mixture of crystalline silica and amorphous hydrated silica, *i.e.*, of quartz and opal. It has a waxy lustre, and is much used by jewellers for necklaces, bracelets, etc. Commonly it is white or creamy. Its bright orange-red variety is called carnelian; its brown variety, sard. Chrysoprase, plasma, bloodstone are varieties which are respectively pale apple-green, dark leek-green, green with red spots.

Chalk, a white limestone, calcium carbonate, found in the Upper Cretaceous deposits (formed from the shells of minute marine organisms). In southern England the chalk is a soft rock, but in Yorkshire, Scotland, and Ireland it is solid limestone. French chalk is hydrated magnesium silicate, a variety of talc.

Chamberlain, Lord, the senior officer of The Royal Household who is responsible for all ceremonial within the palace (levées, courts, garden parties, entertainment of foreign royalties and heads of state) but not the coronation or state opening of parliament. He is also in charge of appointments to The Royal Household and is examiner and licenser of plays.

Chamberlain, Lord Great, one of the great officers of state whose duties are now mainly ceremonial. He attends the monarch at the state opening of parliament and at the coronation and is custodian of the Palace of Westminster (Houses of Parliament). The office is hereditary, dating from Norman times, and is held for one reign in turn by the descendants of the De Veres, Earls of Oxford.

Chameleon, a family of lizards with numerous species. Their ability to change colour is well known, but exaggerated, and is due to the movement of pigment cells beneath the skin. They are slow in movement, arboreal, and mainly insectivorous. Found in Africa, India, Ceylon, Madagascar, and Arabia.

Chamois, a species of antelope, native of Western Europe and Asia. About the size of a goat, it lives in mountainous regions, and possesses wonderful leaping power, so that it is very difficult to capture. Its flesh is much esteemed, and from its skin chamois leather is made, although to-day sheep and goat skins are usually substituted. The mating season is Oct.–Nov. and the fawns are born in May or June. Live to be 20–25 years old.

Channel Tunnel, a scheme to bore a tunnel through 20–30 miles of chalk under the sea between Dover and Calais has been a subject for discussion ever since Albert Mathieu first conceived the idea as a practical possibility in 1802. In the 1830s proposals for a bridge were made. Investigations have been undertaken from time to time, the most recent being that of the Channel Tunnel Group, composed of British, French, and American interests, which was set up in 1957. In 1964 it was announced that the British and French Governments had decided in principle to go ahead with a rail tunnel, thus accepting the recommendations of the Anglo-French study group published in 1963. In 1966 the Minister of Transport said that subject to a satisfactory solution of the problems involved, the tunnel would be built and opened to traffic by 1975. It is to be financed by private capital but operated by a Franco-British public authority. Estimated cost between £130 and £170 million.

Chapel Royal, the church dedicated to the use of the Sovereign and Court. There are, among others, chapels royal at St. James's Palace, Buckingham Palace, Windsor, Hampton Court, the Tower, and Holyrood.

Characterology. *See* J7.

Charcoal, a term applied to wood that has been subjected to a process of slow smothered combustion. More generally it refers to the carbonaceous remains of vegetable, animal, or combustible mineral substances submitted to a similar process. Charcoal from special woods (in particular buckthorn) is used in making gunpowder. Bone charcoal finds use in sugar refining, as it removes dark colouring matter present in the crude syrup.

Chasuble, a sleeveless vestment worn by ecclesiastics over the alb during the celebration of Mass. It is supposed to symbolise the seamless coat of Christ. Its use in English churches was prohibited in 1552, but again permitted after 1559. It gradually fell into disregard, however, but about 100 years ago its use was revived in the Church of England.

Cheese, an article of food made from the curd of milk, which is separated from the whey and pressed in moulds and gradually dried. There are about 500 varieties differing with method of preparation and quality of milk. They used to be made in the regions after which they are named but nowadays many of them are mass-produced, *e.g.*, Cheddar is made not only in all parts of Britain but in Canada, New Zealand, Australia, Holland, and the U.S.A. Cheeses may be divided into 3 main classes: (1) soft, *e.g.*, Camembert, Cambridge, Port l'Evêque; (2) blue-veined, *e.g.*, Stilton, Gorgonzola, Roquefort (made from ewe's milk), (3) hard-pressed, *e.g.*, Cheddar, Cheshire, Gruyère, Parmesan, Gouda.

Cheetah or "hunting leopard," the large spotted cat of Africa and Southern Asia whose ability to reach a speed of 45 m.p.h. makes it the swiftest four-footed animal alive.

Chemistry is the science of the elements and their compounds. It is concerned with the laws of their combination and behaviour under various conditions. It had its rise in alchemy (J2) and has gradually developed into a science of vast magnitude and importance. Organic chemistry deals with the chemistry of the compounds of carbon; inorganic chemistry is concerned with the chemistry of the elements; physical chemistry is concerned with the study of chemical reactions and with the theories and laws of chemistry.

Chestnut, the fruit of the chestnut tree; those of the Spanish chestnut, *Castanea vesca*, furnish a favourite esculent. The wood is used in carpentry; while the horse-chestnut (*Æsculus hippocastanum*) is much employed in brush-mounting and in cabinet work.

Chiaroscuro, a term used in painting to denote the arrangement of light and shade in a picture.

Chiltern Hundreds, three hundreds—Stoke, Burnham, and Desborough—the stewardship of which is now a nominal office under the Chancellor of the Exchequer. Since about 1751 the nomination to it has been used as a method of enabling a member of Parliament to resign his seat on the plea that he holds an office of honour and profit under the crown. (This has been a disqualification for Parliament since 1707.)

Chimpanzee, a large anthropoid ape, a native of tropical West Africa, of a dark brown colour, with arms reaching to the knee, and capable of walking upright. Its brain is about a third of the weight of the human brain, but is anatomically similar. The animal has considerable intelligence and powers of learning. A suitable subject for space flight experiments.

China Lobby, the name applied to the body of opinion and pressure in American politics which strenuously opposes recognition of Communist China, and advocates support of Chiang Kai-shek.

Chinchilla, a South American burrowing rodent.

Grey in colour, and white underneath. It is greatly esteemed for its beautiful fur.

Chippendale Furniture was introduced in the reign of George I. by Thomas Chippendale, a cabinet-maker from Yorkshire who migrated to London and set up for himself in St. Martin's Lane, Charing Cross. He was fonder of inventing designs for furniture than of making it, and in 1752 published a book of patterns; the London furniture-makers of the day soon began to model their work upon it.

Chirognomy. *See* **J8.**

Chivalry, an international brotherhood of knights formed primarily during the 13th cent. to fight against the infidels in the Crusades. For the French the major battle was against the Moslems in the Holy Land and North Africa, the Spaniards fought the same enemy in their own country, and the Germans were concerned with the heathen of Baltic lands, but Chaucer's " very perfect gentle knight " had fought in all these areas. One did not easily become a knight who had to be of noble birth and then pass through a period of probation, beginning as a boy page in the castle of some great lord, serving his elders and betters humbly while he was taught good manners, singing, playing musical instruments, and the composition of verse. Probably he learned Latin, but he certainly learned French, which was the international language of knights as Latin was of scholars. At fourteen he became a squire and learned to fight with sword, battle-axe, and lance, and to endure conditions of hard living while carrying out his duties of waiting on his lord, looking after his horses, and in time accompanying him in battle. Only if he showed himself suitable was he finally knighted by a stroke of the hand or sword on the shoulder from the king or lord. Knighthood was an international order and had its special code of behaviour: to honour one's sworn word, to protect the weak, to respect women, and defend the Faith. To some extent it had a civilising effect on the conduct of war (*e.g.*, knights of opposing sides might slaughter each other in battle but feast together after), but, since war was regarded as the supreme form of sport, it cannot be said to have contributed to peace.

Chlorine, a gaseous element of the halogen family, first isolated in 1774 by Scheele by the action of manganese dioxide on hydrochloric acid. It unites easily with many other elements, the compounds resulting being termed chlorides. The gaseous element is greenish-yellow, with a pungent odour. It is a suffocating gas, injuring the lungs at a concentration as low as 1 part in 50,000, and was used during the first world war as a poison gas. Has a powerful bleaching action, usually being used in form of bleaching powder, made by combining lime and chlorine. Also a valuable disinfectant; used, for instance, in rendering water of swimming baths sterile.

Chloroform, a volatile colourless liquid, compounded of carbon, hydrogen, and chlorine. It is a powerful solvent, not naturally occurring but synthesised on a large scale. When the vapour is inhaled it produces unconsciousness and insensibility to pain. It owes its discovery to Liebig, and its first application for medical purposes to Sir James Young Simpson (**P5**(2)).

Chlorophyll, the green pigment contained in the leaves of plants, first discovered by P. J. Pelletier (1788–1829) and J. B Caventou (1795–1877) in 1818. Enables the plant to absorb sunlight and so to build up sugar. The total synthesis of chlorophyll was reported in 1960 by Prof. R. B. Woodward. This is an outstanding achievement in the field of organic chemistry. *See* **Photosynthesis, F21.**

Chouans, the name given to the band of peasants, mainly smugglers and dealers in contraband salt, who rose in revolt in the west of France in 1793 and joined the royalists of La Vendée. Balzac gives a picture of the people and the country in which they operated in his novel *Les Chouans*. They used the hoot of an owl as a signal—hence the name.

Chough, a member of the crow family, of glossy blue-green-black plumage, whose long curved bill and legs are coral red. It used to be abundant on the cliffs of Cornwall, but its haunts are now restricted to the rocky outcrops of the western coasts and in the mountains near by. It nests in cleft rocks and caves. The Alpine chough with yellow bill inhabits the mountainous districts of Europe and Asia and is not found in Britain. It was found at 27,000 ft. on Everest.

Christmas means " mass of Christ " from the old English *Cristes maesse*, which is celebrated by the Western church on December 25. The actual day on which Christ was born is not known and there is some uncertainty about the year. December 25 as the day of Nativity was not generally observed until the 5th cent. A.D., though, as the winter solstice, it had long been observed as a pagan festival of *sol invictus* (unconquered sun). The first Christmas card dates from about 1843 and the Christmas tree, of pagan origin, was introduced into England from Germany by Queen Adelaide, wife of William IV. Santa Claus is a corruption of Saint Nicolas, patron saint of children, whose feast day properly falls on December 6.

Chromatic Scale, a scale proceeding in intervals of one semitone. *E.g.*, chromatic scale in C: C–D♭–D–E♭–E–F–G♭–G–A♭–A–B♭–B–C.

Chromium, a very hard, bluish-white metal element, symbol Cr, melting at a very high temperature (above 1900° C.). Its chief ore is chromite or chrome iron-ore (ferrous chromite). " Ferro-chrome " is produced by heating chromite and anthracite in an electric furnace, and chrome steels are prepared by adding the pre-calculated amount of ferro-chrome to melted steel. Best known chrome steel is stainless steel first made by Brearley in 1912 and since then developed greatly at Sheffield. A typical formula is 18 per cent. chromium, 8 per cent. nickel, 74 per cent. iron. Equally important are Stellite alloys, containing chromium, cobalt, tungsten (or molybdenum), which have made possible modern high-speed cutting tools. Dies used in manufacture of plastics are commonly of chrome steel. The elementary metal finds little use alone except in chromium-plating for motor cars etc.

Chromosomes, the structures contained within the nucleus of every animal and plant cell by which genetic information is transmitted. The chromosome number in somatic (body) cells is constant for each species of plant and animal, *e.g.*, man (46), cat (38), mouse (40), honey bee (16), fruit fly *Drosophila* (8), potato (48). Chromosomes are long molecules composed of deoxyribonucleoproteins (*i.e.*, proteins and DNA). Human chromosomes have been the subject of much recent research since it has been found that certain disorders are associated with chromosomal aberration, *e.g.*, in Mongolism an extra chromosome is present. *See also* **Genes, Cell Division, F23**(2).

Church Commissioners. The Church Commissioners were established in 1948 by the amalgamation of Queen Anne's Bounty (established 1704) and the Ecclesiastical Commissioners (established 1836) to administer Church revenues and to manage Church property generally. The Commissioners own in investments and real estate a total of over £300 million.

Church of England. *See* **J9.**

Cid, The, a famous Spanish hero of the 11th cent. Don Rodrigo Diaz de Vivar, who, before he was twenty, led a Spanish force against the Moors, and drove them out of Spain. He is celebrated in poem, play, and romance.

Cilia, minute hair-like projections on the surface of some cells, which beat together in wavelike movements like the wind over a corn-field. These movements can be used as a means of locomotion as in the aquatic organism paramecium. Cilia are also found on the outer layers of the human trachea where they waft particles upwards to the throat, thus protecting the lungs. *See* **F26, P31,** *also* **Flagella.**

Cinchona, the tree native to the Andes which is famous for its bark, source of the drug quinine. It was introduced into Ceylon, India, and Java, the latter becoming the main supplier of quinine.

Cinque Ports, a number of seaport towns on the coast of Kent and Sussex, originally five: Hastings, Romney, Hythe, Dover, and Sandwich. Winchelsea and Rye were added later. These ports were required to furnish a certain number of ships, ready for service, and in return

they were granted many privileges. The official residence of the Lord Warden (Sir Robert Menzies) is Walmer Castle, near Dover.

Cistercians, an order of monks and nuns taking their names from Cîteaux, near Dijon, where their first monastery was established in 1098. The order was noted for the severity of its rule. They were famous agriculturists. The habit is white, with a black cowl or hood. The order declined, and in the 17th cent. there was a reform movement instituted by the Trappists, who were later organised into a separate order.

Citron, a species of citrus (*Citrus medica*) related to the lemon, whose fruit has thick rind used for candied peel.

Civil List is the annual sum payable to the Sovereign to maintain the Royal Household and to uphold the dignity of the Crown. The amount is granted by Parliament upon the recommendation of a Select Committee and has to be settled afresh in the first six months of a new reign. The Civil List of Queen Victoria was £385,000; Edward VII. and George V., £470,000; Edward VIII. and George VI., £410,000; Elizabeth II., £475,000. The annuities payable to members of the Royal Family do not form part of the Civil List but are a charge on the Consolidated Fund; Queen Mother, £70,000; Duke of Edinburgh, £40,000; Duke of Gloucester, £35,000; Princess Margaret, £15,000; Princess Anne (at 21) £6,000 (£15,000 on marriage); Prince Andrew (at 21) £10,000 (£25,000 on marriage). Prince Charles has his own income from the Duchy of Cornwall.

Cleopatra's Needle on the Thames Embankment is of the time of Tuthmosis III. (1500–1450 B.C.). The monolith had nothing to do with Cleopatra, as it only came to Alexandria after her death. It was first erected at the Biblical On (Greek Heliopolis), sacred City of the Sun. It was presented to the British Government by Mehemet Ali in 1819, but not brought to this country until 1878. Weight, 180 tons; height, 68½ ft.

Climate is a generalised representation of the day-to-day weather conditions throughout the year, the combination of all weathers thus determining the climate of a place. Averages and extremes of temperature, variation of humidity, duration of sunshine and cloud cover, amount of rainfall and frequency of snow, frost, gales, etc., are amongst the data normally investigated. The interiors of great land masses are characterised by large ranges of temperature and low rainfall (continental climate), while proximity to oceans has an ameliorating effect with increase in rainfall (oceanic climate). Presence of mountain ranges and lakes and configuration generally produce local modifications of climate, also apparent between the centre and the outlying suburbs of a city. There is evidence that vast changes of climate have occurred during geological time. Since the mid-19th cent. most of the world has shown a tendency to be warmer; the rise in annual mean temperature is now over 1° C. But this trend now seems to be easing off. Latitude introduces zones of climate, *e.g.*, tropical rain, subtropical steppe and desert, temperate rain and polar.

Clock, a device for measuring the passage of time. The earliest timekeeper was the shadow-clock, a primitive form of sundial, used in Ancient Egypt about 1500 B.C. To find the time at night the water-clock or clepsydra was used. The sand-glass dates from the 15th cent. No one knows when the first mechanical clocks were invented, but it is known that a complicated mechanical clock driven by water and controlled by a weighbridge escapement was built in Peking in 1090. The Dover Clock in the Science Museum is not the earliest surviving clock in England, as was once believed, but early 17th cent. The Salisbury Cathedral clock dates from 1386 and that of Wells Cathedral from 1392. The pendulum clock was invented by the Dutch scientist Christiaan Huygens (1625–95). The first watches were made in Nuremberg shortly after 1500. The marine chronometer is a high-precision timepiece used at sea for giving Greenwich mean time. The quartz-crystal clocks are accurate to one thousandth of a second a day, and the improved atomic clock, recently developed at the British National Physical Laboratory, which makes use of the natural vibrations of the caesium atom, is said to be an almost absolute measure of time (accurate to 1 sec. in 300 years, *i.e.*, one part in 10^{10}).

Cloisonné, a kind of fine pottery with enamelled surface, decorated with elaborate designs, the outlines of which are formed by small bands or fillets of metal. The Byzantines excelled in this work, but in the 20th cent. Japan and China led in Cloisonné-ware.

Cloud chamber, an apparatus invented by C. T. R. Wilson in which the tracks of atomic particles can be made visible. Just as the vapour trails tell of the track of an invisible aircraft high up in the air, so the vapour trails of an unseeable particle can tell of its behaviour. The rays under investigation pass through a chamber containing a gas, *e.g.*, air thoroughly cleansed of dust, supersaturated with water- or alcohol-vapour. As the particle passes through it forms a track of tiny water droplets which can be photographed. After a long and honourable history this wonderful instrument is now virtually obsolete. A later ingenious device for tracking fast fundamental particles is the Bubble chamber (*q.v.*).

Clouds are formed by the ascent of moist air, the type depending on the way the air ascends and the height at which condensation occurs. There are three main classes: (1) high cloud (above 20,000 ft.)—cirrus (delicate and fibrous), cirrostratus (thin white veil), and cirrocumulus (delicately rippled) consisting of ice crystals; (2) medium cloud (above 7,000 ft.)—altostratus (dense, greyish veil) and altocumulus (broken flattened cloudlets)—chiefly water particles, often supercooled; (3) low cloud (from near ground to 7,000 ft.)—cumulus (fair weather, broken, dome-topped), cumulonimbus (heavy, towering to great heights), stratocumulus (layer of globular masses or rolls), stratus (like fog but off the ground), nimbostratus (low, rainy cloud). The highest clouds of all, and the rarest, are the noctilucent, seen only on summer nights in high latitudes. They form at about 50 miles above the earth and consist of ice-coated dust from meteors.

Clover, plants of the *Trifolium* genus, family *Leguminosae*, with about 250 species. These are "nitrogen fixing" plants and include red clover, white clover, alsike clover, and crimson clover. They are of great importance in agriculture because in a good pasture they supply directly or indirectly most of the protein available to the animals. Seed of "wild white" clover has been accepted since about 1939 as the indispensable plant of good United Kingdom grassland, largely through the efforts of pioneers like D. A. Gilchrist (1859–1927).

Cloves are the dried flower-buds of a species of myrtle (*Eugenia caryophyllata*) grown principally in Zanzibar and Madagascar.

Coal. Until recently the most important single fuel has been coal. It is a mineral of organic origin, formed from the remains of vegetation which over millions of years has changed to coal by the effects of heat and pressure from overlying rock or water. All coal contains moisture, inflammable volatiles, mineral impurities (some of which remain as coal ash after the coal is burnt), and fixed carbon (the coke that is left after the volatiles have been driven off). The relative proportions vary—from Anthracite, a hard coal containing the highest proportion of fixed carbon, to Lignite or brown coal which is little more than a hard peat. World reserves of bituminous coal have been estimated at $7{\cdot}5 \times 10^{12}$ tons. If one adds the reserves of brown coal and lignite, this figure is increased by about 15 per cent. The proportion of the reserves that could be economically recovered varies from country to country and estimates vary from 50 to 100 per cent of the reserves. The reserves are highly localised—over half being located in the Soviet Union. In the United Kingdom coal has formed the basis of past industrial prosperity. Peak output occurred in 1913 when 287 million tons were mined, one third of which was exported. At the end of the Second World War (1946) production had fallen to 183 million tons and was far below demand. During the next ten years great efforts were

made to increase coal output but, quite suddenly in 1956, demand for coal fell as oil became a popular fuel and since then the problem has been to cut back the coal industry without causing undue social problems. A future market of about 170 to 180 million tons is envisaged beyond 1970. In 1947 the British coal industry was brought under public ownership and all its assets were vested in the National Coal Board.

Coal Tar. A by-product in coal-gas and coke manufacture, it is a valuable source of organic intermediates, indeed over 20 different compounds have been isolated, many of which find use in such fields as the manufacture of soaps, fuel, cosmetics, detergents, and drugs as well as dyes. *See* **Benzene, Aniline.**

Coat of Arms, in heraldry, is a device containing a family's armorial bearings. In mediæval times it was an actual coat upon which such device was embroidered, and knights wore it over their armour.

Cobalt, a white metal melting at 1490° C. Two main ores are *cobalt glance* (in which the element is combined with arsenic and sulphur) and *smaltite* (cobalt arsenide). The principal sources are Ontario and the Congo. Various cobalt alloys are important, *e.g.*, stellite, ferrocobalt and carboloy. Its monoxide is an important colouring medium, and is used for colouring glass and porcelain-blue.

Cobra, hooded and very venomous snakes. The best known species are the Indian Cobra, the Egyptian Cobra, and the Black-necked Cobra. Their food consists chiefly of small rodents. The King Cobra is almost exclusively a snake-eater. "Spitting" Cobras (or Ringhals) of S. Africa are a related genus, capable of spitting their venom several yards.

Coca, a S. American shrub, *Erythroxylon coca*, also cultivated in Java. The leaves yield cocaine, classified as a dangerous drug; used medicinally as a local anaesthetic, especially on the eyes and in dentistry. When the natives chew the leaves they are enabled to withstand astonishing amounts of hunger and fatigue, as cocaine acts both as a mental stimulant and as an anaesthetic on the mucous lining of the stomach.

Cochineal *or* **Carmine,** a dyestuff consisting of the dried bodies of the female scale insect (*Dactylopius coccus*) which feeds on cacti. Of ancient origin, the dye was well known to the Aztecs, and was used widely in the Middle Ages. The famous scarlet tunics worn by the English during the Napoleonic wars owed their colour to carmine. To-day it is almost entirely replaced by aniline dyes.

Cockatoo, a member of the parrot family, bearing a crest of feathers on the head, native to Australia and adjacent regions. Predominant colour is white tinged with yellow or scarlet while some species have dark plumage. The great black cockatoo of New Guinea is slaty black with pale red cheeks and can crack Kanary nuts which usually require a hammer to break them open.

Cockchafer (*Melolontha*), one of the most destructive of beetles, the larvae feeding on roots. It is about 1 inch in length, of a brownish colour, and emits a loud whirring sound when flying.

Cockle, the popular name of the bi-valve shell-fish of the genus *Cardium*, found plentifully in sandy bays near low-water line; there are numerous British species.

Cockroach, inaccurately called the "black beetle"; a pest of bakeries and kitchens. In Britain two species are commonly found: the Common Cockroach (*Blatta orientalis*), resident since the time of Elizabeth I, dark brown, about an inch long, with the wing covers long in the male and short in the female; and the German Cockroach (*Blatta germanica*), now the most common, half the size, dark yellow, with both sexes fully winged. All species have long antennae and flattened, leathery, shiny bodies. They are nocturnal and omnivorous.

Cocoa. *See* **Cacao.**

Coconut Palm (*Cocos nucifera*), a tropical tree, growing to a height of 100 ft., with a slender, leaning trunk surmounted by giant feather-like leaves. One of the most important sources of food and raw material for people living in the tropics. The juice of the fruit, or coconut, is drunk; the kernel is eaten fresh or dried to form copra, which yields animal feeding stuffs and oil, used in the manufacture of soap, margarine, cosmetics, synthetic rubber, etc.; leaves are used for thatching; leaf stalks for canes, fence posts, needles, etc., and the trunk for houses and bridges. Main producing areas: Indonesia, Philippines, Malaysia, Ceylon, and S. India.

Codes, a term used to designate a system of laws properly classified. The Code of Hammurabi, king of Babylon, *c.* 1700 B.C., had extensive influence over a long period. The Romans formulated several codes of historic importance including the Theodosian Code which summarised the Roman laws from the time of Constantine to 438 A.D. The final codification was made under order of the Emperor Justinian by his chief minister Tribonian and published in 529 with a new edition in 534. The most important of modern codes is the *Code Napoléon*, compiled between 1803 and 1810, and still in force. It has been used as an example for the codification of the laws of a number of countries from America to Japan. Under Frederick the Great the law of Prussia was codified. English law has never been codified, although the law on certain subjects has been gathered up into a single statue. The Law Commission Act, 1965, was passed to consolidate and codify the law wherever possible. *See* **D5(2).**

Codex, a manuscript volume of the Scriptures comprising the Sinaitic codex of the 4th cent., the Vatican codex of the same period, the Alexandrine codex of the 5th cent., and others. The British Museum, in 1933, purchased the *Codex Sinaiticus* from the Soviet Government for £100,000.

Coffee, a shrub found originally in Arabia and Abyssinia, but now extensively grown in the West Indies, Brazil, India, and Central America. It yields a seed or berry which, after undergoing the necessary preparation, is ground and largely used in most countries as a popular breakfast beverage. The best coffee is the Mocha, an Arabian variety. The stimulating effect of coffee is due to the caffeine, which is also present in tea. The beverage was introduced into Europe in the 16th cent., and the first London coffee shop was opened in 1632.

Coke is the solid residue remaining when coal is carbonised and nearly all the volatile constituents have been driven off. Used as fuel, and as an agent for reducing metallic oxides to metals, *e.g.*, iron ore to iron, in the manufacture of steel.

Colorado Beetle, a serious pest of potato crops. Both adults and larvae feed on the foliage where the orange eggs are laid. The grub is reddish, with two rows of small black spots on each side. The adults are about ½ in. long with yellow and black striped wing cases. The beetle is avoided by birds because of its nasty taste, and is controlled by arsenical sprays.

Colosseum, the name of the Flavian amphitheatre at Rome, begun by Vespasian and finished by Titus A.D. 80. In general outline it still remains one of the most magnificent ruins in the world. In the arena of this great building the famous gladiatorial displays and mimic naval battles used to be given, and about 50,000 spectators could be accommodated.

Colossus is the name which the ancients gave to any statue of gigantic size. The Colossus at Rhodes, which was a bronze statue of the sun god, Helios, was the most famous, and reckoned among the seven wonders of the world. It stood over 100 ft. high at the mouth of the harbour. There is no truth in the legend that ships could pass between its legs. It fell in an earthquake in 224 B.C.

Colugo, also known as "flying lemur", caguan or kubuk, a remarkable mammal which may be regarded as an aberrant insectivore or an aberrant form of the earliest ancestor of the bats. It has nothing to do with lemurs. There are two genera, one inhabiting the Philippines and one inhabiting Malaya. They have a parachute-like membrane which covers them from the neck to the tip of the tail, by means of which they can glide from treetop to ground a distance of up to 70 yards.

Column, in architecture, is an upright solid body serving as a support or decoration to a building. Columns consist of a pedestal, a shaft, and a

capital, over which the supported entablature rises. They are named according to the styles of architecture of which they form part, being Doric, Tuscan, Ionic, Corinthian, or Composite as the case may be.

Comets are celestial bodies which move about the solar system in elliptical or hyperbolic orbits. Usually these star-like bodies are accompanied by a long shining tail. The hyperbolic comets are seen once only, and do not reappear; the elliptical comets are periodic, and their recurrence can be calculated with accuracy. The head of a comet is believed to consist of small lumps of solid matter accompanied by dust particles and gases such as carbon dioxide and methane. It used to be thought that the tail was produced by the pressure of sunlight on the cometary material but a modern explanation is that it is produced by the combined action of the solar wind (a continuous stream of ionised hydrogen originating in the sun) and the interplanetary magnetic field. When they run parallel the effect is to produce a long streaming tail pointing away from the sun. Chief among the periodic comets is Edmund Halley's, the first to return as predicted in 1757. It reappears about every 76 years and is next due in 1985. The most spectacular comet of the 19th cent. was that found by Donati in 1858.

Common Law. *See* D4.

Commons are the remnants of the mediaeval open fields round villages in which the villagers had rights in common, *e.g.*, (i) estover—the right of taking wood for house building or firewood; (ii) pasture—the right of grazing beasts; (iii) turbary—the right of digging turf; (iv) piscary—the right to fish. Many of these common lands were enclosed during the agrarian revolution which went on steadily in England from the 15th cent. onwards, and with their enclosure common rights vanished. A Royal Commission on Common Land described the commons in 1965 as the "last reservoir of uncommitted land" which provide, as far as the public is concerned, by far the largest part of the accessible open spaces of the country. Under the Commons Registration Act, 1965, it is the duty of County Councils and County Borough Councils to make a register of all common land and all town and village greens in their areas.

Commons, House of, the Lower House of the British Parliament. *See* **Section C, Part II.**

Commune of Paris has twice played a dramatic part in the history of France. In 1792 it was able, through its control of the administrative organisation of Paris, to override the National Assembly. In 1871, after the withdrawal of the Prussian troops, it tried to assert its authority. Public buildings were destroyed by members of the Commune and civil war raged during April and half May, but Government troops suppressed the rising.

Communism. *See* J9.

Compass *or* **Mariner's Compass** is an instrument by which the magnetic meridian is indicated, and comprises a horizontal bowl containing alcohol and water, a card upon which the thirty-two points of the compass are marked, and the steel needle which always points to the meridian. Although the discovery of the directive property of a magnet is credited to the Chinese, the first practical use of this property in a compass was made in western Europe in the 12th cent. Aircraft and ships now largely employ gyrostatic compasses which are not affected by electrical and magnetic disturbances. Sperry, Brown, and Anschutz are three important types of gyroscopic compass.

Computer, a technical device for accepting an input of information, processing this information according to some prescribed programme of operations and supplying an output of processed information. Many types of operation can be performed on many types of information and computers are now indispensable in science, business, warfare, government, and other activities. Early thinkers in this field were Pascal (17th cent.), Babbage (19th cent.) and Turing (1930s), but electronic computers as we know them appeared during the Second World War and the first commercial machine was on sale in 1950. Computers are millions of times faster than human beings at computing; and the introduction of computers into an organisation does more than just speed up the calculations, it tends to transform the whole nature of the organisation. The possibilities for future developments seem enormous. Analogue computers and digital computers are two different kinds stemming from the difference between *measuring* and *counting*. Analogue types handle data that is represented by physical quantities of continuously variable size such as voltages or lengths. These quantities can be made to vary like the quantities in a problem which the computer is set to solve; the problem is thus solved by analogy. A slide rule is a rudimentary analogue computer in which numbers are represented by lengths of rule. Digital computers handle actual numbers expressed in digits and the quantities in the problem are represented by discrete numbers. These can all be expressed in binary form and thus stored or handled in bits. *See* **Bit, Binary Notation.**

Conclave, an assembly of Roman Catholic cardinals met together to elect a pope. The last Conclave was held in the Vatican in June 1963 when Cardinal Montini, archbishop of Milan, was elected Pope Paul VI.

Concordat, an agreement or convention between the pope and a secular government regarding ecclesiastical matters. The Concordat of Worms in 1122 between Calixtus II. and the Emperor Henry V. was famous as deciding a long struggle in regard to investiture. In 1801, Napoleon concluded a concordat with Pius VII. defining the restored relations between the head of the Church and the French Roman Catholics.

Condor, a large eagle of brilliant black plumage with a circlet of white feathers round its neck. It is a native of the Andes.

Confederation is a free association of sovereign states united for some common purpose. It is to be distinguished from a **Federation**, which is a union of states with one central government, each state relinquishing its sovereignty, though retaining some independence in internal affairs.

Confucianism. *See* J10.

Coniferae are cone-bearing trees, including firs, pines, cedars, cypresses, junipers, yews, etc., and are widely distributed in temperate regions.

Conservatism. *See* J10.

Consistory, a council or meeting of councillors; also the higher ecclesiastical courts and senates of the Anglican and Roman Churches.

Constitution, the fundamental organic law or principles of government of a nation, state, society, or other organised body, embodied in written documents or implied in the institutions and customs of the country or society. The government of the U.S.A., unlike Great Britain, works upon a written Constitution. It was framed when the U.S.A. came into existence as a sovereign body, when the Constitution built a republic out of a federation of thirteen states, based on representative government. The constitution was adopted in 1789, and its strength has been tested by the fact that, substantially unchanged, it is now the groundwork for a federation which now comprises fifty states.

Continent, a word used in physical geography to denote the larger continuous land masses in contrast to the great oceans of the earth. They are: Eurasia (conventionally regarded as 2 continents, Europe and Asia), Africa, North America, South America, Australia and Antarctica.

Continental Drift. The hypothesis of drifting continents is due to F. B. Taylor, an American geologist who published his theory in 1908, and to the Austrian meteorologist Alfred Wegener in 1910. The latter was impressed by the matching coasts of South America and Africa, which seemed to him to fit together like the pieces of a jigsaw puzzle. Since then many other people have taken up and developed the idea, notably A. L. du Toit. The defenders of the theory advocate that at one time there were two primary super-continents. The one in the northern hemisphere consisted of North America, Europe, and the northern part of Asia. Its southern counterpart included Antarctica, Australia, India, Africa and the south pole. These super-continents broke up, and their various bits moved apart. In particular, the southern hemisphere continents drifted radially

northwards away from the south pole, and the two Americas shifted westwards from Europe and Africa. What would have been the leading edges of the land masses on this hypothesis, are now heavily buckled up into mountain belts, such as the Cordillera and the Alpine-Himalayan chain. The resistance afforded to drifting by the strong ocean floors may well have been the cause of such structures. Despite the wealth of geological facts which have a bearing on the problem of continental drift, none of these has been able to decide the issue in a conclusive manner. Further studies of rock magnetism and of fossil climates should ultimately establish the concept of continental drift on a firm basis.

Conurbation, a term which has been defined as "an area occupied by a continuous series of dwellings, factories, and other buildings, harbours, and docks, urban parks and playing fields, etc., which are not separated from each other by rural land; though in many cases in this country such an urban area includes enclaves of rural land which is still in agricultural occupation." The term has been widely adopted for the contiguous densely populated areas which form continuous urban areas. The seven officially recognised in Britain are: Greater London, West Midlands, S.E. Lancashire, West Yorkshire, Merseyside, Tyneside, Clydeside.

Convention is an assembly of delegates, representatives, members of a party met to accomplish some specific civil, social, political, ecclesiastical or other important object.

Convocation, an assembly called together to deliberate ecclesiastical affairs. In the Church of England the provinces of Canterbury and York each have their convocation. The term is also applied to assemblies of the graduates of certain universities.

Coot. A very widely distributed bird of the rail family and a common resident of the British Isles. The adult is black with a conspicuous white bald shield on the forehead and a white bill. The juvenile is brownish grey with whitish breast and throat. The coot flies heavily, but swims well. It dives frequently and can remain submerged for a considerable time. It is pugnacious and in winter gregarious. The food is chiefly vegetable. The large nest is usually built among aquatic vegetation and the young are fed by both parents. Another species, the Crested Coot, occurs in S. Europe.

Copper, one of the most familiar of metals, symbol Cu, used in ancient times as an alloy with tin in producing bronze, and preceding iron as an industrial material. Copper ores are most abundant in the U.S.A., Chile, Canada, Zambia, and the Congo. All copper compounds are poisonous. Copper sulphate is largely used in calico-printing and in the production of blue and green pigments.

Copyright. Under the Copyright Act, 1956, copyright subsists in every original literary, dramatic, musical, and artistic work if the author is a British subject or a citizen of the Republic of Ireland or resident in the United Kingdom, or if the work is first published in the United Kingdom. The Act provides that, except in certain special cases, the author of the work shall be the first owner of the copyright, and there are no formalities, such as registration or payment of fees, to be accomplished. Copyright includes the right to reproduce the work in any material form, to perform the work in public, or, if the work is unpublished, to publish the work. The Act also protects sound recordings, films, and television and sound broadcasts. Literary, dramatic, musical, and artistic works which enjoy the protection of the Act are automatically protected in those countries which are parties to the Berne Copyright Convention or the Universal Copyright Convention. In general, copyright in literary, dramatic, musical, and artistic works is vested in the author for the period of his lifetime and 50 years following, after which it passes into the public domain and becomes freely available to any who wish to make use of it. The Copyright Libraries, entitled to receive copies of books published in the United Kingdom, give under **Libraries.** A new copyright convention was signed in Stockholm in 1967 which gives "under-developed" countries the right to reproduce, without payment if they choose, any books to be used for teaching, study, or research. The Government Department responsible for matters in connection with copyright is the Industrial Property Department, Board of Trade, 25, Southampton Buildings, London, W.C.2.

Coral, an order of small marine animals closely related to the sea-anemone, but differing from it in their ability to develop a limy skeleton. They multiply sexually and by budding. The structure of the coral secretions assumes a variety of forms, fan-like, tree-like, mushroom shape, and so forth. Red coral (the skeleton of *Corallium rubrum*) is mainly obtained from the Mediterranean. The coral reefs of the Pacific and Indian Oceans are often many miles in extent. Living corals occur only in warm seas at about 23° C.

Cordite, a smokeless explosive adopted for small arms and heavy artillery by the British Government in the naval and military services in 1889, and composed of 58 parts of nitro-glycerine, 37 of gun-cotton, and 5 of vaseline. It is a jelly or plastic dough, and used in the form of sticks.

Cork, the bark of a species of oak, *Quercus suber*, grown largely in the South of Europe and North America. The cork tree is said to yield bark every six to ten years for 150 years, and grows to a height of from 20 to 40 ft. Its lightness, impermeability, and elasticity enable it to be used for a variety of commercial purposes, especially for stoppers of bottles.

Cormorant, a large, long-billed water-bird which captures fish by diving. It has bronze-black plumage with white cheeks and sides and is found around the sea coasts of most parts of the world, including the British Isles. It nests in colonies on sea cliffs and rocky ledges. The Shag or Green Cormorant is a smaller bird with green-black plumage and a crest.

Corncrake. *See* **Landrail.**

Corn Laws were statutes intended for the benefit of British agriculture, and restricted import and export of grain. From the 14th to the mid-19th cent. such laws were in force, and were often of a stringent nature. They became so oppressive and caused corn to reach so high a price that the poorer classes were plunged into distress. A powerful anti-corn law agitation was organised, of which Cobden, Bright, and Villiers were the leaders, and Sir Robert Peel, in 1846, at the time of the Irish potato famine, carried through free trade. The repeal of the Corn Laws marked an important phase in the transformation of an agricultural to an industrial Britain.

Coronae, series of luminous rings surrounding sun or moon produced by the diffraction of light by water droplets in the atmosphere. Usually seen when sun shines through altostratus clouds. The outside of the ring is red and the inside bluish. *See* **Halo.**

Corpus Christi Festival is one of the great celebrations of the Roman Catholic Church, and takes place on the Thursday after Trinity. It was instituted by Pope Urban IV. in 1264.

Cortes, the name of the Parliamentary assemblies of Spain and Portugal.

Cosmic Rays, a form of radiation coming from outer space, of deep penetrating power and of great scientific interest. The rays are believed to consist chiefly of fast protons, with a few α-particles and other positive nuclei. By interacting with the gas of the atmosphere, these rays initiate a complex series of events, in the course of which other particles ("secondary radiations") are generated. The secondary rays contain virtually all the particles listed on F14; indeed, several particles were first discovered as secondary cosmic rays. Cosmic rays are investigated at and below sea-level, on mountains, in mines, in balloons, rockets, and satellites. Origin still uncertain. *See* F3(2).

Cosmology is the science which studies the whole universe, its origin, its nature, its size, and evolution. At present it is a very active science partly because new techniques such as radio-astronomy are revealing more facts about distant parts of the universe and partly because of fruitful clashes between theoretical ideas. *See* F3–7.

Cotton, the name of a plant of several species,

bearing large yellow flowers with purple centres. These centres expand into pods, which at maturity burst and yield the white fibrous substance known as cotton. The raw cotton contains a large proportion of seeds which are removed by "ginning." Long before the Christian era, cotton had been grown and used with great skill in India to make fabrics. The industry was not introduced into England until the middle of the 17th cent. when Protestant refugees from Flanders came to settle in the wool textile districts of East Anglia and Lancashire. With improvements in machinery and expansion of overseas trade in the 18th and 19th cent., Lancashire became the centre of the world's cotton industry. Since the first world war there has been a marked decline in Britain's cotton industry. Cotton reacts with nitric acid to form gun cotton, which is combined with more sensitive explosives to give a more safely handled substance.

Coulomb, a unit of electric charge, named after the French naval engineer, Charles Augustin de Coulomb (1736–1806), equal to the quantity of electricity transferred in one second by a current of one ampere.

County. The word county was introduced after the Norman conquest as an equivalent of the old English "shire." England has 41 geographical counties, Wales 13, Scotland 33, and Ireland 32. The number of administrative counties differs from the number of geographical counties because the division for Local Government purposes is made on grounds of convenience. Under the London Government Act, 1963, the county of Middlesex was completely absorbed in Greater London.

Coup d'Etat, a violent change in the government of a state carried out by force or illegally. Examples are the overthrow of the French Republic in 1851 by Louis Napoleon, who then became Emperor, and more recently the military *coups* in the Middle East which brought about the abdication of Farouk of Egypt in 1952 and the assassination of Feisal of Iraq in 1958.

Court Leet, a court of record held annually before the steward of any particular manor or lordship; originally there was only one court for a manor, but in the time of Edward I. it branched into two, the court baron and the court leet.

Coypu or **Nutria rat**, a large beaver-like rodent found in S. America; now wild in E. Anglia, where it is causing damage to dykes, reeds, and crops, having escaped from farms where it is bred for its fur.

Crane, a large, graceful wading-bird with elegant long legs and neck, greyish plumage, superficially resembling the heron and related to the bustard. They migrate in V or W formation and have trumpet-like voices. There are several species, found in all continents except S. America, including the Crowned Crane with golden coronet and the Demoiselle with tuft-like crest of white feathers. The Common Crane nested in East Anglia in mediaeval times but now comes only as a rare visitor from the Continent.

Credit is an advance of money or of goods or services in consideration of a promise of payment later. Trade credit is such an advance from trader to customer; bank credit is an advance of money by a bank to a client, whether a business firm or a private person, in consideration of an interest payment by the borrower.

Creed, a brief enumeration of a particular belief or religion. The three important Christian creeds are the Apostles' Creed, the Nicene Creed, and the Athanasian Creed.

Cremation, the ancient custom, revived in modern times, of burning the dead. Cremation was first legalised in Great Britain in 1885 and the first crematorium opened at Woking in that year. Application for cremation must be accompanied by two medical certificates.

Cricket, a genus of insects of the grasshopper order which move by leaps. The male produces a chirping noise by rubbing its wing-covers together.

Crimean War (1853–56). This war between Russia and the allied powers of Turkey, England, France, and Sardinia, was connected with the Eastern Question (*q.v.*) and the desire of Russia for a port on the Mediterranean. Chief engagements were the Alma, Balaclava, and Inkerman. Fighting virtually ceased with fall of Sevastopol in Sept. 1855. Treaty of Paris signed March 30, 1856.

Crocodile, the name of the largest existing reptile, and classed with the alligator and the gavial. The crocodile inhabits the Nile region, the alligator the lower Mississippi, and the gavial is found in many Indian rivers.

Crow, a family of birds including many well-known species such as the rook, raven, jackdaw, carrion crow, hooded crow, magpie, nutcracker, jay, and chough.

Crusades were military expeditions undertaken by some of the Christian nations of Europe with the object of ensuring the safety of pilgrims visiting the Holy Sepulchre and to retain in Christian hands the Holy Places. For two centuries nine crusades were undertaken: First, 1095–99, under Godfrey of Bouillon, which succeeded in capturing Jerusalem; Second, 1147–49, led by Louis VII. of France, a dismal failure, which ended with the fall of Jerusalem; Third, 1189–92, in which Richard I. of England took part, making a truce with Saladin; Fourth, 1202–4, led by French and Flemish nobles, a shameful expedition, resulting in the founding of a Latin empire in Constantinople; Fifth, 1217–21, led by John of Brienne; Sixth, 1228–29, under the Emperor Frederick II.; Seventh, 1248–54, under St. Louis of France; Eighth, 1270, under the same leadership, but cut short by his death on an ill-judged expedition to Tunis; Ninth, 1271–72, led by Prince Edward of England, which accomplished nothing. Millions of lives and an enormous amount of treasure were sacrificed in these enterprises and Jerusalem remained in the possession of the "infidels." The chief material beneficiaries were the Italian maritime cities; the chief spiritual beneficiary was the pope; but in literature and the arts both Europe and the Levant benefited enormously from the bringing together of the different cultures.

Crystal, in everyday usage, a solid chemical substance bounded by plane surfaces which show a regular geometrical arrangement as, *e.g.*, quartz crystals, rock salt, snow flakes. In physics the term means any solid whose atoms are arranged in a regular three-dimensional array. This includes most solids, even those not particularly crystalline in appearance, *e.g.*, a lump of lead. Common *non*-crystalline substances are liquids, jellies, glass.

Cubism, the name of a revolutionary movement in art created in the years 1907–9 by the two painters Picasso and Braque. Rejecting purely visual effects, they approached nature from an intellectual point of view, reducing it to mathematical orderliness. Its respectable grandparent was Cézanne who had once written: "you must see in nature the cylinder, the sphere, and the cone"—a concept which, together with the contemporary interest in Negro sculpture, moved the two founders of the movement to experiment with the reduction of natural forms to their basic geometrical shapes. In practice, this meant combining several views of the object all more or less superimposed in order to express the idea of the object rather than any one view of it. The name Cubism was derisive and the movement aroused the same opposition as Impressionism, Fauvism, and the later Futurism. Picasso's *Young Ladies of Avignon* was the first Cubist painting and his "Head" (1909) the first Cubist sculpture. Three phases are recognised: (1) Cubism under the influence of Cézanne; (2) high or analytical Cubism (*c.* 1909–12) concentrating on the breaking-down of form to the exclusion of interest in colour; (3) synthetic Cubism (*c.* 1913) making use of *collage* in which pieces of pasted-on paper (illustrations, wallpaper, newspaper) and other materials were used in addition to paint. Amongst other early cubist painters were Metzinger, Gris, Duchamp, and Léger.

Cuckoo, a well-known migratory bird which is found in Great Britain from April to July, hawk-like in shape, with a very characteristic note, uttered during the mating season only by the male. The hen has a soft bubbling call. It lays its eggs in the nests of other birds, *e.g.*, the meadow pipit and hedge sparrow, but only

one egg in each nest. Feeds mainly on insects, particularly hairy caterpillars.

Cuneiform, the term applied to the written arrow-headed characters found in Assyria, Persia, and Mesopotamia. Good examples may be seen in the British Museum, some of them several thousand years old.

Curfew (Old Fr. *covre-feu* = cover fire), a regulation common throughout Europe in mediæval times by which, at a fixed hour in the evening, the church bell was rung as a signal that fires were to be put out and the people were to go to bed. The custom originated in the fear of fire when buildings were built of timber. Nowadays a curfew is imposed by the military in areas where riots or disturbances are expected, compelling the civilian population to remain indoors after nightfall.

Curia, the central government of the Roman Catholic Church. By the reform which came into force on Jan 1, 1968, its twelve Sacred Congregations or "ministries" were reorganised and reduced to nine. Top Curial appointments are for 5 years instead of for a lifetime, renewable only at the Pope's discretion. The new "finance ministry" is called the Prefecture of Economic Affairs, the "foreign ministry" the Sacred Council for the Church's Public Affairs. The aim of the reform was to streamline the Curial offices so that the Church's machinery can cope with modern problems, so favouring the desires expressed by the Ecumenical Council convened by Pope John.

Curie, a measure of the rate at which radioactive material emits radiation. One curie is a disintegration rate of $3 \cdot 7 \times 10^{10}$ disintegrations per second.

Curlew, a wading-bird of which there are several species. It frequents marshy places, feeds on worms, insects, molluscs, and berries and possesses a very long, down-curved bill.

Currency is the name given to the types of cash money—metal or paper—in use in an area (*e.g.* pound, sterling, dollar, franc). It also designates the actual coins or notes issued. Its amount is usually subject to regulation by the Government, or by a Central Bank acting on the Government's behalf. Britain proposes to change over to a £-based decimal currency in Feb. 1971. *See also* **N10, 27.**

Cybernetics, the science concerned with the automatic control and communication processes in both animals and machines. Thus it is concerned with brain function, information theory, electronic computers, and automation.

Cyclone, a term usually applied to a tropical revolving storm. Cyclones often occur towards the end of the hot seasons and are mainly confined to tracks in the western areas of the oceans, being known as hurricanes (Caribbean and Pacific), cyclones (Indian Ocean), and typhoons (China Seas). The circulation of air in a cyclone is similar to that in the *depression* of temperate latitudes, but the region of low pressure is much more localised and the pressure gradients steeper. Winds of hurricane strength and torrential rain occur generally, although at the centre of the storm there is a small area, known as the "eye," where fair, calm weather prevails.

Cyclotron, a machine for accelerating charged particles such as protons to very high energies. Devised by E. O. Lawrence in California in 1930, it uses a magnetic field to make the particles traverse nearly circular paths and an electric field to give them an additional pulse of energy each time round. The accelerated particles impinge on targets, and the resulting events are a basic source of information for nuclear physicists. The cyclotron is obsolescent and has led to the development of other machines, *e.g.*, betatrons, synchrotrons. Britain has two major national high-energy machines: *Nimrod* (7-GeV proton accelerator) and *Nina* (4-GeV electron accelerator).

Cryogenics (Greek roots: productive of cold) is the science dealing with the production of very low temperatures and the study of their physical and technological consequences. "Very low" is often taken to mean below about −150°C. The growth of cryogenics (essentially a 20th-cent. science) is connected with the discovery of how to liquefy all gases including even helium which resisted liquefaction until 1908. Scientifically, cryogenics is very important, partly because phenomena (such as superconductivity (*q.v.*)) appear at very low temperatures, and partly because ordinary phenomena can be studied with advantage in an extremely cold environment. Technologically, cryogenics is becoming more and more significant, for example, liquefied gases are rocket propellants, superconductors make valuable magnets, tissue-freezing techniques (using very cold liquids) have been introduced into surgery. *See* **Absolute Temperature.**

Dactylopterus, a fish of the gurnard family, with wing-like pectoral fins; sometimes known as the flying fish, though that appellation is more generally given to *Exocaetus exiliens*.

Dadaism (French *Dada* = hobby-horse) was a hysterical and nihilistic precursor of **Surrealism** (*q.v.*) resulting from the shock produced by the first world war. Beginning in Zurich about 1915, it spread to other continental cities, such as Berlin and Paris, dying out in 1922. The movement was deliberately anti-art, destructive, and without meaning; it intended to scandalise by such tricks as "compositions" made out of anything that came to hand—buttons, bus tickets, pieces of wire, bits of tin, etc. Other excesses included incoherent poetry, Dada night-clubs, plays, and short-lived newspapers. Many Dadaist painters became Surrealists at a later stage, but where Surrealism is a deliberate attempt to present subconscious and dream-like images, Dadaism was sheer anarchism. Among its chief exponents were Hans Arp, Marcel Duchamp, André Breton, Guillaume Apollinaire, and Max Ernst, all of whom subsequently became noted in more reputable ways.

Daddy Longlegs, or **Crane-fly**, a slender long-legged fly of the family Tipulidae. The larvae which do damage to lawns and plants are called leather-jackets. The Americans call Harvestmen (*q.v.*) daddy longlegs.

Dafila, a genus of river duck, with long, supple tail, found in Europe, Asia, and America, related to the pintail duck.

Daguerreotype, a first practical photographic process, invented in Paris by M. Daguerre during the years 1824–39. The light-sensitive plate was prepared by bringing iodine in contact with a plate of silver. After exposure a positive image came by development of the plate in mercury vapour. Even for open-air scenes the first daguerreotypes involved exposure of 5–10 minutes. The wet collodion process (1851) rendered the technique obsolete.

Dail Eireann, the name of the national parliament of the Irish Republic.

Dalmatic, a wide-sleeved ecclesiastical vestment, reaching below the knee. Worn by bishops and deacons over the alb or stole.

Damaskeening, the art of inlaying one metal upon another, largely practised in the East in mediaeval times, especially in the decoration of sword blades.

Dandies, the name given to a class of exquisites prominent in early Victorian days, and who attracted attention by excessive regard for dress. Their feminine counterparts were the dandizettes.

Danegeld, a tax imposed in England in Anglo-Saxon times to raise funds for resisting the Danes or to buy them off. Edward the Confessor abolished the tax, but it was revived by the Conqueror and subsequently retained, under another name, after the danger from the Danes was past. It is the basis of all taxation in this country. Domesday Book (*q.v.*) was originally drawn up for the purpose of teaching the State how to levy the tax.

Danelaw, the law enforced by the Danes in the kingdoms of Northumbria, East Anglia, and in the districts of the five (Danish) boroughs—lands grouped round Leicester, Nottingham, Derby, Stamford, and Lincoln—which they occupied during the Viking invasions of the 9th and 10th cent. The country occupied was also called the Danelaw or Danelagh.

Darter, 1. Snakebirds, a genus of the pelican family, with long, pointed bill and serpent-like neck and resembling cormorants in appearance. There

are 5 species. 2. Numerous species of small freshwater fish belonging to the Perch family, found in N. America.

Date Palm, *Phoenix dactylifera*, one of the oldest known food plants widely cultivated in N. Africa and W. Asia. It grows to 100 ft. and continues to bear for 2 or 3 centuries, its fruit being of great value as a food. From the leaves the Africans make roofs for their huts; ropes are made from the fibrous parts of the stalks; and the sap furnishes a stimulating beverage.

Dauphin, the title borne by the eldest sons of the Kings of France from 1349 to the Revolution of 1830.

Day is the most natural unit of time and may be defined as the period of rotation of the earth relative to any selected heavenly body. Relative to the sun it is called the *solar day*. Relative to a fixed star it is called the *sidereal day*. Owing to irregularities in the earth's movements, the time taken for the earth to rotate through 360° relative to the sun is variable, and so the *mean solar day* of 24 hours has been introduced, which is the average throughout the year. The *mean solar day* is our standard, used for purposes of the calendar, and astronomers use *sidereal* clocks to check mean solar time. In practice, for convenience, the sidereal day is determined by the earth's rotation relative to the vernal equinox or first point of Aries, and is equal to 23 hours 56 minutes and 4·091 seconds of mean solar time (*i.e.*, about 4 minutes shorter than a solar day). *See* **Time**.

D.D.T. (dichloro-diphenyl-trichloroethane). A very powerful insecticide which has had wide success in the control of diseases, such as malaria and typhus, which is carried by insects. Mosquito swamps are sprayed with D.D.T. to kill the carriers.

Deacon, an ecclesiastical official, who assists in some of the smaller ministerial duties in church or chapel; in the Anglican Church he ranks below a priest.

Dead Languages are such as the ancient Greek and Roman tongues, which are no longer spoken but are preserved in literature.

Dead Sea Scrolls, a group of ancient Jewish documents, consisting of scrolls and fragments which have been recovered since 1947 in the vicinity of Qumran near the Dead Sea and which represent one of the most important finds ever made in the field of biblical archæology and Christian origins. The scrolls, written in Hebrew or Aramaic, were found in caves, the first by chance by an Arab shepherd in 1947. These consisted of biblical texts older by a thousand years than the earliest Hebrew manuscript of the Old Testament (A.D. 895). Many fragments have since been discovered, comprising the whole of the Old Testament with the exception of Esther. In addition there are commentaries and other non-biblical writings, including one called "The War of the Sons of Light with the Sons of Darkness." The writing on the scrolls indicates that they were written over a period of two centuries, the greater proportion before the birth of Christ. A nearby ruin is believed to have been the home of a religious sect called the Essenes (J15), to whom the scrolls belonged. By the aid of the latest scientific techniques, including radiocarbon tests, the age of the scrolls is being accurately determined.

Dean, a Church of England dignitary, ranking below a bishop, and the head of the chapter of a cathedral. A rural Dean supervises a *deanery* or group of parishes. There are also Deans of Faculties in some universities, and at Oxford and Cambridge the *Dean* is in charge of chapel services and disciplinary arrangements.

Death Watch Beetle (*Xestobium rufovillosum*), a wood-boring beetle, larger than the common furniture beetle, found chiefly in the old oak beams of churches and other historic buildings. The grub bores from 4–12 years. The name "death watch" comes from the superstition that the ticking sound, made by the beetle striking its head against the wood, is a sign of approaching death. The death watch beetle in the roof of Westminster Hall are being smoked out by means of an insecticide called gamma benzine hexachloride. *See also* **Furniture Beetle, Woodworm**.

Decalogue, name given to the Ten Commandments of the Old Testament. There are two versions of them, differing in detail: Exodus xx. 2–17 and Deuteronomy v. 6–21. They are of Hebrew origin and are recognised by Jews and Christians as the divine law given by God to Moses on Mt. Sinai. Most of them are prohibitions in contrast to the beatitudes (pronounced by Christ in the Sermon on the Mount) which are positive, *e.g.*, Blessed are the merciful.

December, the last month of the year in our calendar, and the tenth in the old Roman.

Deciduous Trees are such as shed their leaves at certain seasons as distinguished from evergreens or permanent foliaged trees or shrubs.

Decimal System is based on the unit of 10. **Duodecimal System** is based on the unit of 12. Fractional numbers are expressed as divisions of 10 and 12 respectively. Thus:

Fraction	*Decimal*	*Duodecimal*
	0·5	0:6
	0·3333	0:4
	0·25	0:3
	0·2	0:2497
$\frac{1}{6}$	0·1666	0:2
$\frac{1}{8}$	0·125	0:16
$\frac{1}{12}$	0·0833	0:1
$\frac{1}{24}$	0·04166	0:06

Decimal currency was imposed on France in 1795. A changeover to decimal coinage in 1971, keeping the £ as the basic unit, has been accepted by the British government. The six new coins are:

Denomination	*Value*	*Metal*
½ new penny	1·2*d.*	bronze
1 new penny	2·4*d.*	bronze
2 new pence	4·8*d.*	bronze
5 new pence	1*s.*	cupro-nickel
10 new pence	2*s.*	cupro-nickel
50 new pence	10*s.*	to be announced

See also **Metric System**; **N11**.

Declaration of Independence was an Act by which the American Congress, on July 4, 1776, declared the American colonies to be independent of Great Britain. "Independence Day" is a holiday in the United States.

Defender of the Faith (*Defensor Fidei*), a title conferred upon Henry VIII. by Pope Leo X. in 1521 for entering the lists against Luther with his book on *The Assertion of the Seven Sacraments*. In 1554 the title was confirmed by Parliament and has been used even since by English sovereigns.

Deflation is a policy designed to bring down costs by reducing the supply of means of payment. It is usually advocated as a remedy for inflation, and in this connection is often referred to as Disinflation. It usually results in a fall in employment. The "credit squeezes" in Great Britain were designed to have a disinflationary effect.

Dehydrate, to eliminate the water from a substance. The process of dehydration is now used in the food industry, as a result of wartime research, in making such things as dried egg and packet soups. Most vegetables contain over 90% of water, and much of this can be removed under vacuum at low temperatures without appreciably impairing the flavour. The lightness of the dehydrated products is an advantage when supplies have to be transported.

Deliquescence, the process of dissolving by the absorption of moisture from the atmosphere. For instance, chromic acid crystals on exposure to the air quickly deliquesce.

Delta, a triangular tract of land between diverging branches of a river at its mouth, and so called from its general resemblance to the Greek letter Δ *delta*. The best-known examples are the deltas of the Nile, the Ganges, the Niger, and the Mississippi.

Deluge, a flood, commonly applied to the story of the Deluge in the Bible, in which Noah and the Ark figure. A similar tradition lingers in the mythologies of all ancient peoples.

Democratic Party, one of the two great American political parties, originated about 1787, advocating restrictions on the federal governments and in opposition to the federalists. It was in 1825 that a group who were in favour of high tariffs seceded later to become the Republican Party.

In 1960 Kennedy narrowly won the Presidency and in 1964 Lyndon Johnson swept in with a landslide victory over the Republican candidate.

Demoiselle, the Numidian crane, a wading-bird. Also, a sub-order of dragon flies which close their wings over their backs when at rest.

Dendrite, any stone or mineral on or in which appears natural tracery resembling trees, leaves, or flowers, the result of the action of the hydrous oxide of manganese.

Density, a measure of the mass per unit volume of a material, usually expressed in grams per cubic centimetre. *Specific gravity* is the ratio of the density of a material at the temperature under consideration to that of water at the temperature of its maximum density (4° C.). In grams per cubic centimetre the density of gold is 19·3, silver 10·5, lead 11·3, water 0·99997, air 0·00129.

Depreciation of a currency is a fall in its relative value in terms of gold or of other currencies. The term is most often used to indicate a fall in the value of one country's money in relation to others.

Depression, a region where barometric pressure is lower than that of its surroundings. These areas of low pressure enclosed by the isobars are usually less extensive than anticyclones and may vary from 100 to 1,000 miles in diameter. The winds, often of gale force when the depression is deep, blow round the system in an anticlockwise direction in the Northern Hemisphere (in the reverse direction in the Southern Hemisphere) and inwards across the isobars. The majority of depressions which cross the British Isles travel from the Atlantic, sometimes in series or families, at rates of between a few miles and 700 miles in a day, bringing their generally unsettled weather with them.

De Profundis (out of the depths), the first two words of the Latin version of the 130th Psalm, and commonly used to designate this psalm.

Deserts, vast, barren, stone or sandy wastes where there is almost no rainfall and little or no vegetation. These regions are found in the interior of the continents Africa, Asia, and America between 20° and 30° north and south of the equator. Europe is the only continent without deserts. The most famous are the Sahara, the largest in the world, the Gobi desert of central Asia, the Kalahari desert of south-west Africa, and the great Australian desert.

Detention Centres in Britain are for young people (boys and girls) aged at least 14 but under 21 who have been found guilty of an offence for which an adult could be sent to prison. Controlled by the Home Office.

Detergent. *See* **Detergency, Section F, Part IV.**

Deuterium or "heavy hydrogen." The second isotope of hydrogen; the third is called tritium. Deuterium atoms have in their nuclei a neutron as well as a proton; tritium nuclei have two neutrons and one proton. In ordinary hydrogen gas about one out of every 5,000 atoms is a deuterium atom. Deuterium was discovered in 1932 by Professor Harold Urey. The oxide of deuterium corresponding to water is called "heavy water." The nucleus of the deuterium atom is called a deuteron. An anti-deuteron consisting of an anti-proton and an anti-neutron was produced at Brookhaven in 1965, the first compound anti-nucleus ever to be produced.

Devaluation is a definite, official downward valuation of a country's currency in terms of its exchange value with other currencies. The £ was devalued in 1949, when an official exchange rate of £1 = $2.8 was established, and again in 1967, to a rate of £1 = $2.4.

Devil-fish, a strange marine fish of large size and of several species. As it is met with in European waters it is called the fishing frog, and the chief American species is the giant ray.

Devonian System in geology refers to the strata between the Silurian and the Carboniferous Formations. It includes the Old Red Sandstone Formation. The fauna of the Devonian include the group of fishes known as the Rhipidistra (on the evolutionary route towards the amphibians), Actinistia (coelacanth), and the Dipnoi or lung fishes. *See* **F34.**

Dew, moisture deposited by condensation of water vapour on exposed objects especially during calm, cloudless nights. The loss of heat from the ground after sunset, by radiation, causes the layer of atmosphere close to the surface to be chilled below the temperature, known as the dew-point, at which the air is saturated with vapour. Part of the vapour condensed may be transpired from blades of grass and foliage of plants.

Dew Pond is a shallow artificial pond which is on high ground and rarely dries up, even during prolonged droughts, despite being used by cattle and sheep as a drinking source. The name arose from the belief that dew deposits at night provided the moisture for replenishment. Drainage of rain-water and mist condensed on neighbouring trees and shrubs are probably more important factors.

Dextrin, a white, odourless, viscid substance of the same composition as starch, from which it is obtained. It is used as gum, being the material put on the backs of postage stamps and other articles which are required to be made adhesive. It also is utilised in calico printing.

Dialectical Materialism. *See* **J12.**

Diamond, a mineral, one of the two crystalline forms of the element carbon (the other is graphite), the hardest known substance, used as a gem and in industry. India was the first country to mine diamonds (the Koh-i-noor, known since 1304, came from Golconda near Hyderabad). The celebrated diamond mines of South Africa were discovered in the 1870s. Other important diamond producing countries are Angola, Sierra Leone, Congo, Tanzania, Guyana, and the Soviet Union. Antwerp is the most important diamond centre in the World. Diamonds can be made artificially by subjecting carbon to very high temperatures and pressures; many industrial diamonds are made this way.

Diatoms. One-celled algae, common in fresh and salt water. Distinctive feature is the siliceous wall which is in two halves, one fitting over the other like the lid of a box. These walls are often very finely and beautifully sculptured. The diatoms constitute a class of the plant kingdom known as the Bacillariophyta. *Diatom ooze* is a deep-sea deposit made up of diatom shells. *Diatomite* or *diatomaceous earth* is the mineral form that such diatom oozes assume (sometimes known as kieselguhr which mixed with nitroglycerine yields dynamite).

Diatonic Scale. The ordinary major and minor scales on which most European music is built, *e.g.*,

C major	C – D – E – F – G – A – B – C
Tone intervals	1 – 1 – ½ – 1 – 1 – 1 – ½
C minor	C – D – E♭ – F – G – A♭ – B♭ – C
Tone intervals	1 – ½ – 1 – 1 – ½ – 1 – ½

Dies Irae (the Day of Wrath), a famous 13th-cent. Latin hymn, sung at burial services, and taking its place in translated form in the English hymnology.

Diesel Engine. A compression-ignition engine. The air in the cylinder is compressed to over 500 lb. per sq. in. and its temperature is about 800° F.; oil injected into the hot compressed air ignites immediately. The modern oil engine has been evolved mainly from the principles enunciated by Herbert Akroyd-Stuart in his patent of 1890 and, like the steam and other inventions, represents the improvements achieved by many men including those by Rudolf Diesel of Germany, in respect of high compression pressures and greater fuel economy.

Diet, in German history, an assembly of dignitaries or delegates called together to debate upon and decide important political or ecclesiastical questions. The most famous imperial Diets were those held at Worms (1521), Speyer (1529), and Augsburg (1530), all of which dealt with matters of religious conflict arising from the Reformation.

Diffusion is the process of mixing which occurs when two liquids or gases are in contact. It is most rapid between gases, and, as laid down by Graham's law, "the rates of diffusion of different gases are in the inverse proportion to the square roots of their relative densities." Diffusion arises through the continual movement of molecules. Even in solids diffusion can occur. If a block of gold and a block of silver are welded together, after some time particles of gold are found in the silver, and *vice versa.*

Dimensions in common speech are the magnitudes

of length, breadth, and thickness giving, the size of an object, thus a line has only one dimension: length; a plane surface two: length and breadth; and a solid three: length, breadth, and thickness. In mathematics, hypothetical objects with any number of dimensions are considered. In physics and mechanics, dimensions are numbers which relate the units in which any quantity is measured to the so-called fundamental units. The latter are usually but not necessarily those of length, mass, and time. "Dimensional analysis" is an important technique of scientific reasoning. *See* N14.

Dimorphism, the quality of assuming two distinct forms. For instance, carbon, which is graphite in one form, is the diamond in another.

Dinosaur, the name given to a group of extinct reptiles of the Mesozoic period, some of which were of immense size—much larger than crocodiles. *See* Diplodocus.

Diocese, a territory under the pastoral authority of a bishop. The term originated in the time of the Roman Empire, and represented then an administrative rather than an ecclesiastical territory.

Diopside, a variety of pyroxene occurring in prismatic crystals, chemically calcium magnesium silicate. Two light-green varieties, malacolite and alalite, are gemstones.

Dioptase, or emerald copper, a scarce copper ore occurring in prismatic emerald green crystals, and composed of silicate of copper.

Diorite, an igneous rock of crystalline structure composed of felspar and hornblende. It used to be classed as greenstone.

Dip Needle. Instrument for measuring the *dip* or inclination of the earth's magnetic field.

Diplodocus, one of the best known of the extinct mammoth dinosaurs. Fossil remains have been discovered in the Jurassic rocks of the United States. Some reached a length of over 80 ft.

Dipnoi *or* **Lung Fishes**. These have the air bladder adapted to function as a lung, and they can remain alive when the stream or marsh in which they live dries up. Species of lung fish occur in Australia, Africa, and S. America.

Diptera, an order of insects. Their main characteristic is that they are two-winged, and the common house-fly is the best-known example. There are at least 50,000 species of these insects, including gnats, blow-flies, mosquitoes, tsetses.

Diptych was a folding two-leaved tablet of wood, ivory, or metal, with polished inner surfaces, utilised for writing with the style by the ancient Greeks and Romans. The same term was applied to the tablets on which the names of the persons to be commemorated were inscribed in the early Church. In art any pair of pictures hinged together is styled a diptych.

Discus, a circular piece of metal or stone about 12 in. in diameter, used in athletic contests by the ancient Greeks and Romans. Throwing the discus was a very favourite game, which was deemed worthy of celebration in Myron's famous *Discobolus* (*c.* 460 B.C.–450 B.C.), the best copy of which is in Rome.

Disk, an astronomical term denoting the seemingly flat surface of celestial bodies as seen by the eye.

Distillation, a process used to separate liquids of different boiling points. This is effected by placing the mixture in a distillation apparatus and heating. The liquid with the lower boiling point distils over first, the vapour being condensed and collected, forming the first *fraction*. With continued heating the second liquid reaches its boiling point distils over and the mixture is said to be *fractionated*. Mixtures of liquids with close very high boiling points require more elaborate apparatus. Fractional distillation is a common process in the chemical industry, particularly in the refining of petroleum.

DNA (Deoxyribonucleic acid), a polymer molecule in the form of a double-strand helix containing many thousands of sub-units. Contains the genetic information coded in sequences of sub-units called bases. *See* Nucleic Acids.

Docks are enclosed water spaces where ships rest while being loaded or unloaded, or waiting for cargo. There are three main types: the wet dock (*e.g.*, King George V. dock, London) is for loading and unloading; the dry dock, or graving dock (*e.g.*, King George V. dock, Southampton) is for overhauling and repairing vessels, and is so constructed that, after a ship has been docked the water can be drawn off; the floating dock is a type of dry dock.

Dodo, an extinct bird, giant and flightless, which lived on the island of Mauritius up until 250 years ago. Another species, the white dodo, lived on Réunion. Some reached exceptional sizes. By the end of the 17th cent. Mauritius, Rodriguez, and Réunion had all been colonised, and the dodo along with many other birds vanished forever because of their inability to stand up to man and the animals imported into the islands.

Dog-days, a period of 40 days (3 July–11 Aug.) when Sirius rises and sets with the sun. The ancient superstition, which can be traced back in Greek literature to Hesiod (8th cent. B.C.), was that this star exercised direct influence over the canine race.

Doge, the chief magistrate in the former republics of Venice (697–1797) and Genoa (1339–1797, 1802–5).

Dogfish, a large family of small sharks, seldom more than 3 ft. in length. The flesh is sold as "rock salmon." The eggs are contained in horny cases called "mermaid's purses." The commonest of the British dogfishes are the spurdogs.

Dog Licences are necessary for household dogs of six months of age or over. The cost per dog is 7*s.* 6*d.*, and the licence can be obtained at any Post Office. Dogs for tending sheep or cattle, or for leading blind persons, are exempt.

Doldrums, a nautical term applied to those areas of the Atlantic and Pacific towards which the trade winds blow and where the weather is calm, hot, and sultry but liable to change suddenly to squall, rendering navigation difficult.

Dolomite, a name applied to a limestone containing appreciable magnesium; also the mineral dolomite, a double carbonate of magnesium and calcium.

Dolphin, an ocean mammal of the whale order, from 6 to 8 ft. long, with a long, sharp snout, and of an active disposition. They abound in most temperate seas and swim in shoals. A few species live in large rivers (Ganges and Amazon). They can cruise for long periods at around 15 knots and produce bursts of speed in the region of 20 knots, the water apparently flowing smoothly past their bodies. Dolphins are some of the most intelligent of mammals and are currently the subject of scientific experiments in communication.

Dome, a large cupola, hemispherical in form, rising over the main building of a cathedral or other prominent structure. The finest existing dome, that of the Pantheon at Rome, is also the oldest, dating from the time of the Emperor Hadrian. It is 142 ft. in diameter and about the same in height. The dome of St. Peter's, in the same city, has a double shell, is 330 ft. high and 140 ft. in diameter. The dome of the cathedral at Florence is 139 ft. in diameter and 310 ft. high, and that of St. Paul's, London, has 3 shells and is 112 ft. in diameter and 215 ft. high. The circular reading-room of the British Museum has a dome 140 ft. in diameter and is 106 ft. high. Malta's Mosta dome is also famous.

Domesday Book is the famous register of the lands of England framed by order of William the Conqueror. According to Stowe, the name was derived from *Domus dei*, the name of the place where the book was deposited in Winchester Cathedral; though by others it is connected with doom in the sense of judgment. Its compilation was determined upon in 1084, in order that William might compute what he considered to be due to him in the way of tax from his subjects. William sent into each county commissioners to make survey. They were to inquire the name of each place, the possessor, how many hides of land were in the manor, how many ploughs were in demesne, how many homagers, villeins, cottars, serving men, free tenants, and tenants in soccage; how much wood, meadow, and pasture; the number of mills and fish ponds; what had been added to or taken away from the place; what was the gross value at the time of Edward the Confessor. So minute was

the survey that the Saxon chronicler of the time reports "there was not a single hide, nor one vintage of land, nor even, it is shame to tell, though it seemed no shame to do, an ox, nor a cow, nor a swine was left that was not set down." The record, which did not take in Northumberland, Cumberland, Durham, and parts of Lancashire and Westmorland, was completed on Nov. 15, 1085, and was comprised in two volumes—one a large folio, sometimes called the Little Domesday, which deals with Essex, Norfolk, and Suffolk, the other a quarto, sometimes called the Great Domesday. The first is written on 384 double pages of vellum in one and the same hand, and in a small but plain character, each page having a double column. The quarto is written on 450 pages of vellum, but in a single column and in a large, fair character. The original is preserved in the Public Record Office. *See also* Danegeld.

Dominicans, an order of mendicant preaching friars founded by St. Dominic in Languedoc in 1215 and confirmed by the Pope in 1216. The rule of the order was rigorous. The dress was a white habit and scapular with a long black mantle. This gave them the name of Black Friars. Their official name is Friars Preachers.

Donjon, the keep, or inner tower of a castle, and the strongest and most secure portion of the structure. This was the last refuge of the garrison, and there was usually a prison on the lower floor, hence the name *dungeon*.

Don Juan, the legendary hero of many famous works, supposedly based on the life and character of the unscrupulous gallant Don Juan Tenorio of 14th-cent. Seville. The first dramatisation of the legend and the most famous is Tirso de Molina's *El Burlador de Sevilla*. Don Juan was also the subject of Molière's *Le Festin de Pierre*, Mozart's *Don Giovanni*, Byron's *Don Juan*, and José Zorilla's *Don Juan Tenorio*. The latter is played on All Saints' Day throughout Spanish-speaking countries.

Don Quixote, the "knight of the doleful countenance," the hero and title of Cervantes' classic novel of 16th-cent. Spain. Don Quijote de la Mancha, a gentle country gentleman of lofty but unpractical ideals, having read many chivalric romances, believes he is called upon to redress the wrongs of the world. Mounted on his nag Rosinante and accompanied by his companion Sancho Panza, a hard-headed and practical peasant, he sets out on his journeys of knight-errantry

Dormouse, a family of small, squirrel-like rodents widely distributed throughout Europe and Asia, and living mainly on fruit and nuts. It is of nocturnal habits and sleeps through the winter.

Dot, a French term indicating the property which a wife brings to her husband on marriage, and is usually settled on the woman, being her separate property, though the income from it may go towards the general household expenses.

Dotterel, a handsome bird of the plover family found in northern Europe and Siberia. Nests in the Cairngorms, the Grampians, and E. Ross. Very tame.

Doukhobors. *See* J12.

Drachm (or **Drachma**), an ancient Greek silver coin and weight. One drachma was equivalent to six obols. The word has survived as the name of a weight: Avoirdupois, one-sixteenth part of an ounce; Apothecaries' Weight, one-eighth part of an ounce.

Drag. Term used in mechanics for resistance offered by a fluid to the passage of a body moving through it. When speed of sound is reached drag increases abruptly. The lift/drag ratio gives the aeroplane designer his measure of aerodynamic efficiency.

Dragon, a fabulous monster common to folk-lore in most countries; generally represented as a winged reptile with fiery eyes and breath of flame. A dragon guarded the garden of the Hesperides; in the New Testament there is mention of the "dragon, that old serpent, which is the devil"; St. George, England's patron saint, is supposed to have overcome the dragon; mediaeval legend abounds in dragons; in heraldry the dragon has also a conspicuous place; and in China it was the imperial emblem.

Dragonade, the term given to the series of persecutions of Huguenots in France in the reign of Louis XIV., just before and after the revocation of the edict of Nantes, dragoons being chiefly employed in the work. Since then the term has been used in reference to any onslaught on the people by soldiers.

Dragonet, the name of the fish of the *Callionymus* genus, beautifully coloured, and about a foot in length. They are common on the British coast and in the Mediterranean.

Dragon Fly, the common name of a well-known order of insects having two pairs of membraneous wings, and often of very brilliant colours. They are swift of flight and may be seen hovering over sheets of water in the sunshine all through the summer. Their chief food is mosquitoes.

Dragon's Blood, a dark-red resinous substance obtained from the fruit of a Malay palm, and possessing medicinal virtues. In a special technique used for making line blocks in printing, dragon's blood is used.

Drama. *See* M25; Contemporary Theatre, I1–32.

Drawbridge, a bridge that can be lifted up so that no passage can be made across it. It was a usual feature of a fortified castle in the Middle Ages, and was raised or lowered by chains and levers. It spanned the fosse, and on the approach of an attacking party was raised and formed a special barricade to the gate. Modern drawbridges are such as are raised to allow of the passage of boats up and down a river or estuary. The Tower Bridge is a famous London bridge of this type.

Drongo. The King Crow or Indian Black Drongo is frequently seen in India perched on branches or telegraph wires, darting suddenly to catch insects and to attack crows and hawks. Other members of the family are found in Asia, Africa, and Australia. Its plumage is black with steel-blue gloss.

Drosophila *or* **Fruit Fly**. More has been learnt by geneticists from breeding experiments with this insect than with any other.

Dross, the name generally applied to the refuse of molten metal, composed of slag, scales, and cinders.

Drought, a period of dry weather, is a normal and recurring condition in many warm climates, and is frequently provided against by irrigation. In the British Isles really long rainless spells are somewhat rare, and an "absolute drought" is defined officially as a period of at least fifteen days on each of which the rainfall is less than $\frac{1}{100}$ inch. The summer of 1959 was wholly without precedent in all parts of Britain for lack of rainfall, abundant sunshine, and warm weather. In South Yorkshire an absolute drought lasted 59 days, the longest period in British records.

Drupe is the scientific term for stone fruit. The stone forms the inner part (endocarp) of the fruit, and encloses a seed or kernel which is liberated after the fleshy part (pericarp) has rotted.

Dry-rot, the term was first used about 1775 to describe the fungal decay of timber in buildings. Creosote distilled from coal tar is the standard material for preservation of timber, and pentachlorophenol and copper naphthenate are two compounds now extensively used. Dry wood always escapes dry-rot. Chief fungi causing dry-rot are *Merulius* and *Poria*.

Duck, water bird smaller than the related goose and swan, which together form the family Antidae. Duck refers to the female, drake to the male. The duck family falls into two separate groups: the river or freshwater (surface feeding) ducks, such as the mallard, pintail, wigeon, shoveler, mandarin, teal, garganey; and the sea (diving) ducks, such as the goldeneye, pochard, scoter, elder, and the fish-eating mergansers or "sawbills." The ancestor of all domestic breeds, with the exception of the muscovy, is the mallard.

Duck-bill, *Ornithorhynchus anatinus*, also duck-billed platypus, a fur-covered, egg-laying, nest-building mammal inhabiting Australia and Tasmania. It has webbed feet and a muzzle like a duck's bill and is about 20 in. long.

Ductility is a property possessed by most metals which renders them capable of being stretched without breaking. Gold is the most, and lead the least ductile of metals, the order being gold,

silver, platinum, iron, copper, palladium, aluminium, zinc, tin, lead. In animated nature the spider and the silkworm produce secretions of notable ductility.

Dugong. A marine mammal, belonging to the order Sirenia (sea-cows). Inhabits Red Sea and Indian Ocean; also found as far East as the Philippines and Australia. Lives on sea-weed. Related to the Manatee.

Duke, the highest rank in the British peerage next to that of a royal prince. Edward, the Black Prince, eldest son of Edward III., who died before his father, was the first English duke, being created Duke of Cornwall in 1337. Since then all Princes of Wales have held that title.

Dukeries, a range of English woodland and park country, mainly in Nottinghamshire, comprising the adjacent demesnes of several English dukes and nobles. The Dukeries include Sherwood Forest and the estates of Welbeck Abbey, Clumber Park, Worksop Manor, and Thoresby Hall.

Dunes. Sand dunes are elliptical or crescent-shaped mounds of loose sand produced by wind action. The dune has a gentle slope on wind-ward side; a steep slope on the leeward side.

Dunlin, very common small wading-bird of the Sandpiper family nesting in Britain. Its range extends to other areas where it also breeds.

Dunmow Flitch, a custom which originated in the parish of Little Dunmow, Essex, in the reign of Henry III., which was that the husband who was prepared to swear before the prior, convent, and townsfolk of Dunmow that he had not repented of marriage or quarrelled with his wife for a year and a day, should be rewarded with the gift of a flitch of bacon. The custom has frequently been revived.

Dunnock (*Prunella modularis*), a small bird of rich brown and dark grey plumage common in gardens and hedgerows. Sings a cheerful song all the year round. Called hedge-sparrow in southern England. Another member of the same family, the larger Alpine Accentor (*Prunella collaris*), is found on rocky mountain slopes of Europe and Asia.

Duodecimo, a sheet of paper folded into twelve leaves, written "12mo."

Durbar, a term used in India from the Persian word *darbár* meaning "court" or "audience." It may be either a council for administering affairs of state, or a purely ceremonial gathering. The word was applied to great ceremonial gatherings like Lord Lytton's durbar for the proclamation of the Queen-Empress in 1877 and the Delhi durbar of 1911.

Dust, solid particles of matter floating in the atmosphere, produced chiefly by volcanic eruptions, sand-storms in desert regions, and industrial and domestic smoke. When the island of Krakatoa erupted in 1883, more than 1 cubic mile of dust was thrown into the air and carried three times round the earth by the explosion wave. The particles in dust-storms are much finer than those in sand-storms and are swept up to far greater heights. The local whirlwinds which form over loose dry soils are termed dust-devils.

Dyke. A wall-like intrusion of igneous rock which cuts across the bedding or other layered structure of the country rock; the word also signifies in alternative usage, a sea-wall and an open drain.

Dynamite, a powerful explosive whose chief element is nitro-glycerine. It was discovered by Nobel in 1867, who absorbed nitro-glycerine in kieselguhr; has a disruptive force of about eight times that of gunpowder.

a current is produced in a conductor (*e.g.*, copper wire) traversing a magnetic field. The two essential parts of a dynamo are the conductors or *armature* and the *field magnets*.

Dynasty, a succession of monarchs of the same family, as the Carlovingian dynasty, the Bourbon dynasty, the Plantagenet dynasty, etc.

E

Eagle, large bird of prey with huge hooked bill, related to the buzzard, kite, hawk, harrier, falcon, and vulture, together forming the family Falconidae. There are many species to be found throughout the world, the Golden, Imperial, Tawny, Spotted, and Lesser Spotted being found in Europe. The Golden Eagle, a magnificent-looking bird, nests in the Scottish Highlands, and the White-tailed Sea Eagle, which used to breed in Britain, is now only an occasional visitor. The eagle has been the symbol of royal power since the earliest times, and the American or Bald Eagle is the emblem of the United States.

Earl, a British title of nobility of the third rank, duke and marquis coming first and second. The title dates from Saxon times, and until 1337 ranked highest in our peerage.

Earl-Marshal, in England ranks as the eighth of the great officers of state, is head of the College of Arms, attends the sovereign in opening and closing the session of Parliament, arranges state processions (especially coronations) and assists in introducing newly created peers in the House of Lords. The office is hereditary in the family of the Dukes of Norfolk.

Earth, our habitable globe, is the third of the planets of the solar system in order from the sun, and on an average throughout the year takes 24 hours to turn completely round relative to the sun, the whole earth revolving round the sun in a slightly elliptical orbit once in a year of 365·2564 days. The mean distance of the earth from the sun is 93,004,000 miles. The shape of the earth is that of an oblate spheroid, its equatorial and polar axes measuring 7,926 miles and 7,900 miles respectively. Earth satellite studies have shown that it is also slightly pear-shaped, with the stalk towards the north pole. The scale of this effect is such that the south pole is 50 ft. nearer the centre of the earth than the north pole. The crust consists of an outer layer of surface soil of varying thickness, beneath which there is a mass of hard rock several miles deep, the percentage (by weight) of the principal elements present being oxygen 47, silicon 28, aluminium 8, sodium and potassium 5, iron 4·5, calcium 3·5, magnesium 2·2, titanium 0·5, hydrogen 0·2, carbon 0·2, phosphorus and sulphur 0·2. Mass of the earth is estimated to be 6,000 million million million tons. Two-thirds of the earth's surface is covered with water. It has only one satellite, the moon. The earth receives more light from the sun in 13 seconds than it does from the moon in one year. Weather changes are independent of the moon. A recent estimate of the age of the earth's crust is 5,000 million years. Recent discoveries suggest that the earth is embedded in the atmosphere of the sun and that some of the heat that reaches us from the sun gets here by direct conduction through interplanetary space. *See* F8–9, 55.

Earthquake, a sudden violent disturbance of the earth's crust; the region of the surface immediately above the "focus," or source where the earthquake originates, is termed the "epicentre." On account of their destructive power earthquakes have attracted attention from the earliest times, but accurate study dates only from the last century and the development of a world-wide network of recording stations from the present one. The majority of severe earthquakes result from fractures, usually along existing faults, in underlying rock strata subjected to great strains, the shearing movement sometimes extending to the surface. These dislocations set up vibrations which are propagated as waves throughout the bulk of the earth or round the crust. Frequently the main shock is followed by a series of smaller after-shocks. Minor local earthquakes may be attributed to the effects of volcanic activity, but most of the larger ones originate in non-volcanic regions along well-marked lines of weakness in the earth's crust. Generally the ground is felt to tremble, undergoing oscillations which may gradually or suddenly increase to a maximum and accompanied by sounds. Where there is movement of the sea-bed a tidal wave may result. One of the greatest of historic times was that which destroyed and flooded Lisbon in 1755. Among the notable shocks of the present century rank those of San Francisco (1906), Messina, Italy (1908), China (1920), Japan (1923), Napier, New Zea-

land (1931), N.E. Assam (1950), Ionian Is. (1953), Agadir, Morocco (1960), Chile (1960), Iran (1962), Yugoslavia (1963), E. Turkey (1966), W. Sicily (1968).

Earthworm, of which there are several species, has a cylindrical body, tapering at both ends, and segmented into rings. It moves by contraction of its rings, aided by retractive bristles; is eyeless, but has a mouth, gullet, and stomach. Earthworms exist in immense numbers, and perform an important part in the scheme of nature by loosening the soil and rendering it more amenable to tillage. They also form a valuable food for birds and many mammals, and are unequalled as bait for certain kinds of fish.

Earwig, a genus of insects possessing two pairs of wings and anal forceps. It is nocturnal lives on vegetable matter, and hides by day under stones or in flowers, *e.g.*, dahlias. The old belief that it deliberately creeps into people's ears is altogether unfounded. *See* T30(2).

Easter, the annual Christian festival in commemoration of the resurrection of Christ, the English name being derived from Eostre, goddess of Spring. The date cannot fall earlier than March 22 nor later than April 25. Many disputes arose among the early Christians as to the proper time to celebrate this day which governs all other movable feasts. It was eventually ruled at the Council of Nicaea in 325 that Easter Day should be the first Sunday after the full moon following the vernal equinox. If this happens to be a Sunday, then Easter Day is the Sunday after. It should be remembered, however, that this moon is a hypothetical moon of the ecclesiastical calendar, quite imaginary, and generally one or two days later than the real moon we see in the heavens. In fact the reverend fathers at Nicaea did us a bad turn in having anything to do with the moon but then they had no Astronomer Royal to advise them of the complications. *See also* N25.

Eastern Question, a term formerly applied to the problems arising from the instability of the Mohammedan power of Turkey and its relations with the other nations of Europe. Later connected with other problems of the Near East, such as the possession of Constantinople and the position of the Balkan states.

East India Company was incorporated by Elizabeth in 1600. In 1613 the Company set up a factory at Surat, India, and in 1662 Bombay came under the Company's influence and developed into an important trading port. Dupleix wanted to establish French power in India and a struggle for supremacy took place. Clive gained the victory for England and thenceforward British dominion in India remained undisputed except by native princes. In 1772 Warren Hastings was appointed the first Governor-General and in 1784 Pitt's India Act established a Board of Control for the India Company. A great increase of trade resulted, and this rule continued down to 1858, when, as a result of the mutiny, the Crown assumed the sovereignty. With the passing of the Indian Independence Act of 1947, British dominion ended and India was handed back to the Indians.

Eau-de-Cologne, a popular distilled perfume first manufactured at Cologne in the 18th cent. by Johann Maria Farina, an Italian, and since made in large quantities in Cologne and elsewhere.

Ebony, a name applied to various hard black woods, the best of which are grown in Mauritius and Ceylon. There are also Indian and American varieties. Only the inner portions, the heart-wood, of the trees are of the necessary hardness and blackness. Ebony is largely used in ornamental cabinet work, for piano keys, canes, etc.

Ecce Homo ("Behold the Man!"), used in reference to the pictures and sculptures representing Christ crowned with thorns.

Ecclesiastical Courts, courts for administering ecclesiastical law and maintaining the discipline of the Church of England. Introduced by the Normans. Originally they had jurisdiction over both clergy and laity. *See also* D24(1).

Eclipse, an obscuration of the light of the sun, moon, or other heavenly body by the passing of another body either between it and the eye or between it and the source of its light. The sun is eclipsed by the moon intervening between it and the earth; the moon by the earth passing between it and the sun. Total eclipses of the sun have occurred over parts of the British Isles in the years 1424, 1433, 1598, 1652, 1715, 1724, 1927, 1954 (visible from the Shetland Is.), and the next will be seen only from near Land's End on Aug. 11, 1999.

Ecliptic is the sun's apparent path in the sky: the great circle described by the sun from west to east in the course of a year. The sun is exactly on the equator on approx. March 21, and Sept. 23, and the points where the celestial equator and ecliptic intersect on these days are called the *equinoctial points*. On approx. June 21 and Dec. 22 the sun reaches its greatest and least midday elevation and its greatest distance north and south of the equator, and the points on the ecliptic on these days are called the *solstices* (*see* Seasons, N25). These four points are equidistant from each other by 90°. The equinoctial points are not fixed. The angle of inclination of the ecliptic to the equator is called the obliquity of the ecliptic, which is also variable, being influenced by the gravitational action of the other planets on the earth. At present the angle is 23½°.

Ecumenical Council, a general council of the Christian Church summoned when important questions of Church doctrine and policy are to be decided. The early councils were predominantly Greek and convoked by the emperor. Those summoned by the pope when they meet at the Lateran Palace in Rome are called Lateran Councils; others have met at Constance, Florence, Trent, and the Vatican. Their decisions are not binding on the rest of Christendom. Only 21 Ecumenical Councils have been held in the history of Christendom. The first was held at Nicaea in 325 when the mystery of the Trinity was defined. The 21st (known as the 2nd Vatican Council), convened by Pope John, opened in Oct. 1962 in St. Peter's Rome, and ended in Dec. 1965. Two of the principal themes were the reunion of all Christians with the Church of Rome and the Church's place in the modern world. At the last session of the Council the Pope announced his decision to establish for the first time an international synod of bishops in Rome for consultation and collaboration in the government of the Roman Church. This Senate of Bishops will provide the balancing factor alongside the Curia, which represents the Papacy and not the episcopasy.

Edda, the name given to two important collections of early Icelandic literature—*the Elder or Poetic Edda*, poems handed down from the 9th and 10th cent., probably Norwegian in origin, and the *Younger* or *Prose Edda* of Snorri Sturluson compiled about 1230. They treat of mythical and religious legends of an early Scandinavian civilisation.

Eddystone Lighthouse, 13 miles south of Plymouth, is one of the most isolated in the world. The tower is 168 ft. high, and its light can be seen for 17½ miles. The present structure is the fourth that has occupied this dangerous position. The first was of wood, completed by Winstanley in 1698, but it was destroyed by storm in 1703. In 1708 a second and stronger lighthouse was built by Rudyerd. This lasted until 1755, when it was destroyed by fire. Smeaton built the third lighthouse of granite and this withstood storm and tempest for over a hundred years, 1759–1881. The present lighthouse, also of granite, was built 1879–81 on a nearby rock by Sir James Douglass.

Edelweiss, a white perennial flower of the daisy order, common in Alpine regions.

Education History of. *See* J13.

Eels, edible fishes of the order Apodes, with snakelike body covered with minute scales embedded in the skin. The common or freshwater eel *Anguilla anguilla* is found in the Atlantic coastal areas of N. America and Europe and in the Mediterranean, and breeds S.E. of Bermuda. The electric eel of S. America is a variety of great interest, being able to cause electric shocks.

Egg-plant *or* **Aubergine**, a plant cultivated for its ovate fruit, varying in colour from dark purple to white.

Egret, a slender, graceful bird of the heron family, of pure white plumage, famed for its beautiful silky plumes (aigrettes), which appear in the

breeding season, and for which it was ruthlessly hunted and would have been exterminated had not international action been taken to protect it. The Little Egret with black bill, black legs, and yellow feet breeds in Mediterranean lands.

Ego. *See* Freudian Theory, Section F, Part III.

Egyptian Vulture is smaller than other vultures. Found in S. Europe, frequents native villages and scavanges for offal.

Eider, a large diving duck, found along the rocky coasts of northern latitudes, well known for the beautifully warm soft down, called "eider down," which the female bird plucks from her breast to line her nest. In Norway and Iceland the haunts of the eider are preserved and the birds protected by law on account of the much prized "eider down," which is collected from the nests just before the breeding season. "Eider down" is so elastic that a pound or two of it will fill an ordinary bed covering.

Eiffel Tower, built by the French engineer Alexandre Gustave Eiffel (1832–1923) for the Paris Exhibition of 1889. The tower which is made of iron is 985 ft. high and weighs about 7,000 tons.

Eisteddfod (a sitting) was originally a congress of Welsh bards and minstrels, and dates from before the 12th cent. These assemblies, discontinued for a long period, were resumed in 1819, and have been held yearly since, each lasting three or four days. Their object is to foster the Welsh patriotic spirit; they are devoted to orations and competitions in poetry, singing, and harp-playing, prizes being awarded to the successful contestants.

Eland, largest species of antelope, native of Africa; large pointed horns, stands 5 feet high at the withers, and weighs several hundred pounds.

Elder, small trees of the *Sambucus* genus, with pinnate leaves, and clusters of white flowers and, later, small purplish-black berries. The black elder, the best known, is common in most parts of Europe, and thrives in Britain. A wine is made from its berries.

El Dorado, a "golden land," was an idea much favoured in the days of the early Spanish explorers. It was believed that somewhere on the South American continent there was a country abounding in gold and precious stones. Many expeditions were fitted out to discover it. Sir Walter Raleigh also went forth on this illusive quest. The term is still used in regard to any place of rich promise.

Electret, a piece of solid matter which retains a permanent electric polarisation analogous to the magnetic polarisation of a permanent magnet. There are various recipes for making them; carnauba wax is a common constituent.

Electricity. *See* F18, *also* Energy Conversion.

Electric Light is produced in several ways, commonly by causing a tungsten wire to heat up to incandescence by passing a current through it. Current may also be forced through ionised gases, causing them to glow. Such discharges include neon lights, sodium and mercury-vapour street-lamps, and various intense electric arcs used for technical purposes. In fluorescent lights an electric discharge causes ultra-violet (invisible) light, which then excites luminosity in certain chemical substances called luminescent materials. Other forms of electric lighting are being investigated.

Electric Telegraph may be said to date from 1836, when Sir Charles Wheatstone and his co-inventor Cooke introduced their Single-Needle instrument, which was soon followed by the Double-Needle apparatus. Morse, in 1837, invented his famous recording instrument. The first electric cable was between Dover and France, and was laid in 1850. The first Atlantic cable was laid in 1858, and the second in 1866. It was in 1899 that the first Marconi wireless telegraph messages were sent between England and France.

Electrolysis is the condition established when an electric current passes through a conducting substance, between electrodes, resulting in decomposition and separation into constituents. Water thus becomes decomposed into hydrogen and oxygen.

Electrometer, an instrument for measuring differences of electrical potential. The moving part, perhaps a needle, is affected by electrostatic forces and no current flows through the instrument. High sensitivity can be obtained.

Electron. *See* F10, 14.

Electron Microscope. A microscope in which beams of electrons are focused by magnetic lenses in a manner analogous to the focusing of light beams in the ordinary optical microscope. Modern electron microscopes have very high resolving power and can magnify up to 1,500,000 times, making it possible to explore the cell and the virus. A development of the electron microscope is the scanning electron microscope (stereoscan), recently developed at Cambridge, which can examine an essentially thick object, giving a very large depth of focus. *See* Section F, Part IV.

Electronvolt, unit of energy used in nuclear physics. It is the amount of energy required to move one electronic charge through a potential difference of one volt. It is very small—$1{\cdot}6 \times 10^{-12}$ ergs—and therefore suited to atomic physics. 1 MeV = a million electronvolts and this larger unit is used in nuclear energy physics.

Electronics. The science which deals with the behaviour and control of free electrons. It started with the discovery of the electron by Sir J. J. Thomson in 1897. The practical applications, constituting electronic engineering, have given us radio, radar, photo-electric cells, cathode-ray oscillographs, electron microscopes, television. Nowadays electronics uses devices like transistors such that the electrons move inside solid matter instead of *in vacuo*. This is sometimes referred to as "solid state electronics."

Electrophorus, a simple device for producing static electricity, consisting of a smooth disc of resin or ebonite mounted on a metal base and with a metal cover carrying an insulated handle. The disc is first electrified (negatively) by rubbing it with a dry catskin or flannel and the cover replaced, the upper surface receiving a positive charge and the lower a negative. On lifting off the cover, after having touched it with the finger, the negative charge leaks away to earth and the positive charge is isolated on the cover. The action may be repeated a number of times before it is necessary to replenish the original charge on the disc. Of historical interest only.

Elements. In chemistry, an element is a substance in the simplest form to which it has been reduced. Ninety elements are found naturally on the earth, one is observed spectroscopically in the stars, and a further twelve have been made artificially. Between them these elements can appear in some 1,200 different isotopes, of which 317 occur in Nature. (There are 274 stable isotopes among 81 stable elements.) *See* F9(2), N34.

Elephant, a proboscidian mammal of which only two species survive—the Asiatic, in India, and the African elephant. No other animals possess a trunk. Both males and females have large ivory tusks, of considerable commercial value. The Indian elephant is usually about 9 ft. high and weighs about 3 tons; African elephants are larger, weigh about 6 tons, and are usually much fiercer. Several fossil elephants of still larger bulk have been discovered, including the mammoth and the mastodon. The Indian elephant is domesticated and used as a beast of burden, and may live 70 years.

Eleusinian Mysteries, festivals common throughout ancient Greece, agricultural in their symbolism.

Elgin Marbles, a collection of ancient Greek sculptures and architectural fragments got together by the 7th Earl of Elgin and brought to England between 1802 and 1812. These celebrated treasures had originally formed part of the Parthenon at Athens, and were probably carved by pupils of the sculptor Phidias. Lord Elgin expended over £70,000 upon them, and they were purchased for £35,000 for the British Museum, where they can now be seen displayed.

Elk, the largest animal of the deer family, possessing enormous antlers, and standing, when mature, about seven feet high. The American moose is of the same family.

Elm, a stately, wide-spreading tree having some 20 species spread over north-temperate regions, several of which are native and peculiar to Britain. The grandest of the field elms is the English elm, *Ulmus procera*, which may reach a height of 140 ft. and a girth of 25 ft. The

wych elm, *U. glabra*, or Scots elm, is a valuable hardwood and used in boat-building.

Elzevir, the name of a celebrated family of Dutch printers, who produced editions of Latin, French, and German classics, which were highly valued for their beauty of type and accuracy of printing. They flourished in the 17th cent.

Embalming, the process by which dead bodies are preserved from decay by means of spices and drugs. The art reached perfection in ancient Egypt, as the mummies which still exist so powerfully testify. In modern times many experiments in embalming have been tried, with various degrees of success.

Ember-days are set apart for fasting and prayer in the Western Church, at the periods appointed for ordination, viz., the Wednesday, Friday, and Saturday after the first Sunday in Lent, Whit-Sunday, Sept. 14 (Holy Cross Day), and Dec. 13 (St. Lucia's Day). They are of very ancient origin.

Embossing, the art of stamping in relief letters or designs upon pliant substances.

Embryology, that branch of biology which deals with embryos, tracing their development from fertilisation of the germ or seed to birth.

Emerald. The rich green variety of beryl (beryllium aluminium silicate). The colour is due to the presence of chromium oxide.

Emery, a granular substance of the corundum order, generally mixed with other metallic substances, and used in a powdered state for polishing and grinding purposes. Emery is mined in Asia Minor and the Grecian archipelago.

Enamel, a vitrified substance applied as a coating to pottery and porcelain. The art was practised by the Assyrians and Egyptians, and was introduced into Europe by way of Greece. Enamels are all either of the transparent or opaque kind, and are susceptible to an immense variety of colouring, according to the metallic oxides introduced.

Encaenia, a festival commemorating a dedication; at Oxford University the annual commemoration of benefactors, accompanied by the conferring of honorary degrees, is held in June.

Encyclical Letters, a term used in reference to letters addressed by the Pope to his bishops upon matters of doctrine or discipline.

Encyclopaedists, a term first applied to the eminent writers who collaborated in the French *Encyclopédie* (1751–65). They included Diderot, D'Alembert, Voltaire, Helvetius; their writings generally were sceptical as to religion, destructive as to politics, and had great influence in popularising the social ideas which afterwards resulted in the French Revolution.

Energy. One of the most fundamental concepts of science. A body in motion possesses *kinetic energy* as a result of the *work* done by the forces creating the motion. But a force which does work to stretch a spring does not create motion. Instead, the work is stored up in the spring and is one example of *potential energy*. A raised body also possesses potential energy which turns into kinetic when the body falls. The *heat energy* contained in a body is the sum of the kinetic and potential energy of the constituent atoms which are vibrating all the time. Heat and motion are obtainable from electrical, magnetic, chemical, atomic, and other sources, and physicists therefore define corresponding forms of energy. The vital point is that all forms of energy are transferable into one another *without loss or gain*. This is the Law of Conservation of Energy. It is one of the most fundamental laws of science, and its general validity is the reason why energy is an important idea. Since Einstein, it has been recognised that mass also is interchangeable with energy. *See* F13, *also* Nuclear Energy.

Energy Conversion. For practical purposes it is frequently necessary to change energy from one into another of its many forms; indeed almost every activity does this in one way or another. The primary sources of energy are the sun, uranium and other elements from which nuclear energy can be drawn, and the tides. The sun is not much used *directly* because its heat is intermittent and not very intense, but solar cookers and refrigerators have been invented and solar batteries (*q.v.*) are used in spacecraft. The sun can be used *indirectly* because it has produced, *via* living processes, fossil fuels like coal and oil and still continues to generate winds, rain, and rivers and hence hydroelectric and wind power. Commonly both fossil fuels and the energy of river or tidal waters are converted into electricity. Wind-mill type electricity generators are also quite common. The bulk of electricity production is a two-stage process: first fossil or nuclear fuel is used to create heat (*see* Nuclear Reactors); then the heat is used to raise steam and drive generators. Efforts are being made to convert heat into electricity more directly, *e.g.*, by using thermoelectric or thermionic effects (*q.v.*), but these have not been used for large-scale production. Once electrical energy is available, factories can make chemical batteries in great numbers and these can then be used as portable energy sources, as can petrol and other refined forms of fossil fuel. *See* Battery, Fuel Cell.

English Language. *See* M29.

Engraving is the art of cutting or otherwise forming designs of pictures on wood, stone, or metal surfaces for reproduction by some method of printing. Wood-engraving was the earliest in the field, dating from the 15th cent. Later, engraving on steel and copper plates was introduced, and mezzotint, lithography, stipple, aquatint, etc. With the development of photography, and an increased knowledge of the use of acids, many readier methods of engraving were adopted, and now wood-engraving, which was formerly resorted to for all general engraving purposes, is comparatively little used. What is styled "process" engraving is the most utilised.

Ensilage, a method of storing and preserving fodder, vegetables, etc., in pits dug in the ground and excluded from air or light. The system was practised in ancient Rome and revived in England in the 19th cent.

Entablature, that portion of a building which surmounts the columns and extends to the roof of the tympana of the pediments; it comprises the architrave, the frieze, and the cornice.

Entomology is the study of insects. *See* Insects.

Entrepreneur. An entrepreneur or undertaker, is a firm which brings together the factors of production needed for producing goods or services, undertaking the risks and uncertainties involved—though it may transfer some of them by insurance or by other methods. The entrepreneur may be either an individual or a company or corporation, private or public.

Enzymes. Organic catalysts which accelerate chemical processes occurring in living organisms. There are a large number present in the cell, and most have a high degree of specificity. Enzyme mechanisms are the key to basic biological processes. *See* F23(1).

Epaulette, a shoulder badge fringed with cord, worn by English army officers until 1855; now confined to naval officers, and varying in form and richness according to the rank of the wearers.

Ephemoptera *or* **May-flies**, an order of insects. In the larval condition they exist from two to three years aquatically, but no sooner do they arrive at maturity than their lives are hurried to a close. They rise up in pyramids on warm summer nights, take no food, propagate, and perish. The Latin name expresses the fact that the adults have an ephemeral existence.

Ephod, a vestment worn by a Jewish high priest, and sometimes by priests of lower rank. In olden times it was of rich texture and set with gems.

Epiphany, a church festival celebrated on January 6, Twelfth Day.

Equator, the imaginary great circle of the earth, every point of which is 90 degrees from the earth's poles, and dividing the northern from the southern hemisphere. It is from this circle that the latitude of places north and south is reckoned. The celestial equator is the circle in which the plane of the earth's equator meets the celestial sphere (the imaginary sphere, in which the observer is at the centre, used for representing the apparent positions of the heavenly bodies).

Equinox, the time when the sun crosses the plane of the earth's equator, making day and night of equal length. *See* N25.

Eras are distinctive periods of time associated

with some remarkable historical event or personage. *The Christian era* is computed according to a 6th-cent. reckoning to begin with Jesus's birth, A.D. 1. The date is placed some years too late. Scholars now believe that Jesus was born *c.* 6 B.C. The *Jewish era* dates from 3761 B.C.; the *Julian era* from the alteration of the calendar by Julius Caesar 45 B.C.; the *Mohammedan era* from the date of the *Hejira*, or the flight of Mohammed from Mecca to Medina, which is A.D. 622, July 16, in the Gregorian Calendar.

Erbium, belongs to the group of rare-earth metals discovered by Mosander in 1842.

Erg, the unit of work and energy in the centimetre-gram-second system: the energy involved when a force of 1 dyne moves its point of application through a distance of 1 cm.

Erl-King, a forest fiend of German mythology, who lured children from their homes and carried them off. In Goethe's ballad the "Erlkönig" it is a traveller's child who is lured to destruction.

Ermine. *See* **Stoat.**

Ernie, the name given to the "electronic random number indicator equipment", the electronic machine which selected the prizewinning numbers in the first Premium Bond draw held June 1–2, 1957.

Eros. This asteroid is 15–20 miles in diameter. It comes closer to the earth than any other member of the solar system with the exception of the moon and several very small asteroids. Determination of solar parallax based on observations of Eros in 1930–31 yielded the most accurate estimate of the distance of the sun from the earth (93,004,000 miles).

Erse, a term used by Lowland Scottish, and English writers for the Gaelic language spoken in the Highlands of Scotland. Sometimes erroneously applied to Irish, the Gaelic language as spoken in Ireland and revived as an official language in recent times. Dr. Johnson, Sir Walter Scott, and other writers used "Erse" to signify Scottish Gaelic. The language of the Scottish Lowlands (that used by Robert Burns) is related to the English language and not to Gaelic and is variously termed Scots, Braid Scots, the Doric, the Scottish vernacular, and, fashionably of late, Lallans.

Escutcheon, a shield-shaped surface called a field, upon which a man's armorial bearings are represented. A woman's escutcheon is lozenge-shaped.

Espalier, lattice work upon which to train fruiting or ornamental trees.

Esparto Grass grows in great abundance in Spain and North Africa, and the pulp is largely used for paper-making as well as for other purposes.

Esperanto, an artificial international language created by L. Zamenhof of Warsaw and first published in 1887. It does not seek to replace national languages but to serve as a second language for international communication. It is based on the internationality of many words in the principal modern languages, and is entirely phonetic in spelling and pronunciation.

Esquire, formerly a title applied to a young man of noble birth who attended on a knight and carried his shield. The title ranked next below that of knight and was applied to the eldest sons of knights and the younger sons of peers. Later it became a courtesy title and given to any man as a mark of respect.

Essential Oils are oils derived from plants by distillation or expression, and much used in perfumery as well as to some extent in medicine.

Estate Duty is the duty payable upon the value of all property passing on the death of any person. As from 4 April 1963 the rates are: not exceeding £5,000, nil; £5,000–£6,000, 1%; £6,000–£7,000, 2%; £7,000–£8,000, 3%; rising gradually to 80% on estates exceeding £1,000,000. After March 19, 1968, gifts made by deceased during his life are liable to duty if made within seven years before death, subject to graduation of the charge in the case of gifts made more than four years before death. Gifted insurance policies and other gifts in which the deceased never had an interest are subject to aggregation with other property chargeable. Gifts made for charitable purposes are liable to duty if made within one year before death. Gifts made in consideration of marriage (parties to the marriage and their issue) are exempt from estate duty as are buildings and land of special interest bequeathed to non-profit-making bodies for preservation. Gifts not exceeding £100 in value (or in certain circumstances £500) also exempt.

Estates of the Realm in Great Britain are the Lords Spiritual, the Lords Temporal, and the Commons. They are the great classes invested with distinct political powers, and whose concurrence is necessary to legislation.

Esters. Organic chemicals formed by combining an alcohol with an acid. They have a pleasant smell, and occur naturally in plants as the scent of flowers. Manufactured for use in the perfumery industry, and as flavourings in food. Some esters are used as solvents, notably amyl-acetate ("pear drops") in quick-drying paints. The polymeric fibre "Terylene" consists of chains of molecules containing many ester groups, formed by reacting an alcohol having two alcoholic (OH) groups with an acid having two acid (COOH) groups.

Etching, a process of engraving, on copper usually, the design being drawn with a steel needle, and the lines produced by the action of an acid or mordant.

Ether, in chemistry, is a volatile inflammable liquid composed of carbon, hydrogen, and oxygen. It is a valuable anaesthetic obtained by heating alcohol with sulphuric acid. In physics, in the 19th cent., all space was supposed to be filled with a substance called ether, the chief property of which was to carry light waves, *i.e.*, light was supposed to be waves in this all-pervading medium known as the ether. Speculation and experiment concerned with the ether were very fruitful in advancing physics. Ultimately the attempts by Michelson and Morley to detect the motion of the earth through the ether were unsuccessful in this respect but profoundly successful in stimulating the theory of relativity. The ether concept has now been abandoned. *See also* **F13(2).**

Ethylene. A gas compounded of carbon and hydrogen, it is related to acetylene and ethane. Industrially it is obtained as a by-product in petroleum refining. It has wide uses as a starting material in the industrial manufacture of intermediates, especially alcohol. Its most important application is in the production of polythene (poly-ethylene). *See* **Catalyst.**

Etruscans, people believed to have come from Asia Minor who colonised Italy about 900 B.C., settled in what is now Tuscany and part of Umbria, reached the height of their civilisation about 500 B.C., and were ultimately absorbed by the Romans. They were skilled technicians in bronze, silver, and goldwork, and excelled in the art of granular decoration.

Etymology treats of the science and structure of words, including classification and derivation.

Eucalyptus. This genus includes 300 species of evergreen, leathery-leaved trees native to Australia. The oils yielded by different species vary a great deal in their scent and other properties and are chiefly used in pharmacy and perfumery; about 30 species produce oils suitable for medicinal purposes. Various species produce timber.

Europium, element discovered by Demarcay in 1906. A member of the rare-earth metal group.

Evaporation is the process by which a solid or liquid is resolved into vapour by heat. The opposite process is condensation. Wherever a liquid or solid surface is exposed, evaporation takes place into the space above. If the vapour is continually removed the solid or liquid vanishes into vapour; the higher the temperature the quicker the process. If the vapour is confined, then it collects, getting more concentrated until as many atoms of vapour are condensing as are evaporating. The vapour is then said to be saturated. Evaporation of water from sea, soil, plants, skin, etc., is continuously in progress, so it is a process of fundamental importance to meteorology, botany, physiology, industry, not to speak of human comfort and homely activities such as laundry.

Everest Expeditions. For many years after Mt. Everest had been shown to be the highest mountain in the world, political conditions in Nepal, lying south of the summit, and in Tibet, to the north, prevented mountaineers from

attempting an ascent. At last in 1921 the Tibetan authorities gave permission, and the first expedition, organised, as were all subsequent British expeditions, by a joint committee of the Royal Geographical Society and the Alpine Club, and led by Col. C. K. Howard-Bury, was sent out. This was primarily a reconnaissance; besides mapping the northern flanks, it found a practicable route up the mountain. By 1939, six further expeditions had climbed on the northern face. Some were baulked by bad weather, others by problems previously little known, such as the effect of high altitudes on the human body and spirit. Nevertheless, notable climbs were accomplished. In 1924, for example, Col. E. F. Norton reached 28,163 ft., and it was on this expedition that G. L. Mallory and Andrew Irvine were seen going well at about the same height. They never returned, however, and what disaster befell them is not known. After the war, political conditions again closed the Tibet route: permission was eventually obtained from the Nepalese Government to make the attempt from the south. In 1951 a reconnaissance expedition under Eric Shipton reached the ice-fall at the exit of the Western Cwm (a high valley lying south-west of the massif), and reported favourably on the prospects for an ascent. The first attempt from this side was made the following year by a Swiss expedition led by Dr. E. Wyss-Dunant, two members of which made an attempt on the summit, but were stopped at approx. 28,200 ft. by the intense cold and the very strong winds. When the British 1953 Expedition, led by Col. (now Brig. Sir) John Hunt, was being organised, stress was laid on three main points; proper acclimatisation of the climbers; use of oxygen for the final stages; and the establishment of very high altitude camps, so that the final assault parties would set out fresh and unencumbered. Great attention was also paid to recent developments in diet, clothing, and equipment. In all these matters the 1953 expedition was able to draw on the accumulated experience of their predecessors. By the end of April, a base camp had been established below the ice-fall, and with the aid of thirty-four Sherpa porters supplies had been carried up into the Western Cwm. The next critical stage was the ascent of the steep head of the cwm, the Lhotse face, with the threat of avalanches always present. By most strenuous efforts, a camp was established on the South Col (25,800 ft.) on May 21. From this camp on May 26, T. D. Bourdillon and R. C. Evans climbed the South Peak of Everest (28,720 ft.), then the highest altitude ever attained. On May 28 Edmund Hillary and the Sherpa leader, Tenzing Norkey, spent the night at the highest camp (27,900 ft.) and on the following day, May 29, climbed to the South Summit, negotiated the difficult final ridge, and reached the summit of Everest—the climax of a long, arduous, and stirring endeavour.

Evolution, in the words of Sir Julian Huxley, "a natural process of irreversible change which generates novelty, variety, and increase of organisation." The theory, as laid down by Darwin, is that all existing species, genera, and classes of animals and plants have developed from a few simple forms by processes of change and selection. Up to the time of Darwin a large part of the civilised world believed that life had been created suddenly at the beginning of the world which God had created, according to Archbishop Usher, on 22 Oct. 4004 B.C. The evidence of the rocks, however, has given a more convincing theory of creation, and by studying the fossils preserved in the various layers of the earth's crust the past history of the earth's life has been pieced together. Darwin has been called the Newton of biology. *See* F36.

Excommunication, exclusion from the rights and privileges of the Church. It is of two kinds—the major, which means a total cutting off, and the minor, which shuts out only from participation in the Eucharist. In mediæval times, major excommunications were often launched against rulers and leaders.

Exchequer, which derives its name from the checkered tablecloth on which accounts were calculated in early Norman times, is a term connected with the revenues of the Crown. In former times it had jurisdiction in all revenue matters. The term Exchequer is now applied to the Governmental department which deals with the public revenues, the working head of which is the Chancellor of the Exchequer.

Existentialism. *See* J15.

Exploration. Modern exploration began in the second half of the 15th cent. with the voyages of the great Portuguese and Spanish discoverers. They were followed by sailors of other European nations, who profited from their developments in navigation and from their charts, and in less than one hundred years the coast-lines of much of the Americas, Africa, and south-west Asia had been revealed and the globe circumnavigated. The motives of these early explorers were mixed: they were seeking adventure, trade, plunder, national power, and the conversion of the heathen. Few if any were directly interested in advancing scientific knowledge. But from the reports of their voyages and travels, scholars at home compiled descriptions of the strange new world which stimulated their successors to undertake more systematic enquiries. One of the earliest English expeditions to be despatched for scientific research was that of William Dampier on the *Roebuck*, which was sent out by the Admiralty in 1699 to examine the coasts of North-west Australia. In the 18th cent. British explorers were at work mainly in the Pacific Ocean, with the object of breaking the Spanish monopoly of trade. Capt. James Cook sailed thither in 1769 to observe first the transit of Venus at Tahiti, and then to search for the alleged great southern continent. On this voyage he discovered and charted much of the coasts of New Zealand and the east coast of Australia. On his second voyage he was the first to sail across the Antarctic Circle, and he showed that the southern continent was much smaller than had been supposed. By 1800 the general outlines of the continents, except for Antarctica were known, and explorers in the 19th cent. were largely engaged in opening up the interiors. In Africa British explorers solved two problems which had puzzled men for centuries: Mungo Park and Richard Lander established the true course of the River Niger, and Sir Richard Burton, J. H. Speke, Sir Samuel Baker, and others revealed the true sources of the Nile. The greatest African explorer of that age was undoubtedly David Livingstone, the missionary, who in three great journeys explored the Zambesi and the region of the Great Lakes, spreading the Gospel, fighting the slave trade, and opening up the interior to settlement and trade. In North America Alexander Mackenzie was the first to cross the main breadth of the continent from sea to sea. In Asia motives were also mixed; men like Charles Doughty, who explored in Arabia, and Sir Francis Younghusband, who journeyed from China to India across the Gobi and the Himalaya, were impelled by a love of adventure and the quest for knowledge, but political considerations were often involved. In recent years, with the main features of the world's surface known, exploration has become more intensive. Teams of scientists go out to study restricted areas in detail. An Antarctic expedition can contribute to our knowledge of world weather, or by biological research into the life history of whales, can help to improve our food supplies. Similarly, expeditions in Africa can help to check the loss of valuable agricultural land through soil erosion, or to develop areas of settlement by schemes for irrigation and power. And there are still great areas to be adequately mapped. All these problems are inter-related, and in solving them the modern explorer can call on many improved techniques and instruments—the aeroplane, the aerial camera, tracked motor vehicles, radio, in fact all the resources of modern science. But the human element is still vital, and for those with the old explorers' spirit there will always be problems left to solve.

Explosives, substances which burn violently to produce gases in such volume that an explosion is induced. Gunpowder was the first explosive to be used; Roger Bacon's powder, consisting of charcoal, sulphur, and nitre, was the only

practical explosive for centuries. 1845 brought gun-cotton, made by treating cotton with a mixture of sulphuric and nitric acids; but it was not until 1865 that Sir Frederick Abel perfected the process of manufacture that made it safe enough to store and use. In 1867 Alfred Nobel discovered how to make dynamite by absorbing nitro-glycerine in kieselguhr; in 1886 he produced cordite, evaporating a solution of gun-cotton and nitro-glycerine in acetone, the resultant jelly being squeezed through jets to form cords. Cordite came into general use as a propellant. High explosives, providing bursting charge for shells and bombs, include: T.N.T. (trinitrotoluol), picric acid (known as lyddite, melinite, etc.), cyclonite (R.D.X.). Chemical explosives have been eclipsed by nuclear explosives which have developed from the first atom bomb (dropped on Hiroshima 6 August 1945) to the 100-megaton hydrogen bomb.

Expressionism, a modern art movement confined primarily to the non-Latin countries of Europe which sought to give expression to intimate and personal emotions by means of distortions of line and colour and simplified style which carried a greater impact in terms of feeling. Broadly speaking, this has been characteristic of northern art in general. (*See* Gothic) The term is usually used of the modern movement which influenced the Post-impressionists and subsequent movements in France. Tired of the naturalism of the Impressionists, such artists as van Gogh, Gauguin, Matisse, and Rouault together with the Fauvists (*q.v.*) made use of simple outlines and strong colours. Apart from Toulouse-Lautrec, the principal Expressionists were Norwegian, like Munch, or German, like the painters of *Die Brücke* and *Der Blaue Reiter* groups. Individual artists were Ensor, Kokoschka, Nolde, Rouault, and Soutine.

Extreme Unction, the final sacrament of the Roman Catholic and Greek Churches, administered to a dying person, and consisting of the anointing with holy oil, after confession and absolution.

F

Fabian Society. *See* J16.

Fables are fictitious narratives intended to enforce some moral precept, and may be either in prose or verse, and deal with personified animals and objects or with human beings. Aesop in ancient times and Hans Christian Andersen and the Brothers Grimm (in many of their stories) in later days, have given fables. Mention must also be made of La Fontaine's and Krylov's fables.

Faience, a kind of decorated glazed earthenware invented in Faenza, Italy, about the end of the 13th cent. Wedgwood-ware is a notable example of modern faience.

Fairs were established in mediæval times as a means of bringing traders and customers together at stated periods, and formed the chief means of distribution. The great English fairs of early times were those of Winchester and Stourbridge near Cambridge. Traders from the Netherlands and the Baltic gathered there with the great merchants of London, and goods of every kind, wholesale and retail, were sold. The British Industries Fair is the modern counterpart of the mediaeval trade fair. One of the biggest trade fairs was at Nijni-Novgorod, founded in the 17th cent.; other big continental fairs are those of Leipzig (founded in the 12th cent.), Lyons, and Prague.

Fairy Rings are the circles caused in grassland by certain fungi. The circles expand outwards as the fungus spreads, the fruiting bodies being at the periphery. Farther inward where the fungi are decaying the grass grows more strongly, fertilised by the nitrogen released from the rotting fungi. In olden times these rings were held to be the scene of fairy dances.

Falcon, name given to diurnal birds of prey which belong to the same family, *Falconidae*, as the hawk, eagle, buzzard, kite, and harrier. They are swift of wing and feed on birds and small mammals. These birds have long, pointed wings, strong, hooked and notched bill, long, curved claws, and an eye of great power. They are found all over the world. Those that breed in Britain are the Kestrel (the most common), Hobby (one of the swiftest of European birds), Merlin, and Peregrine, a swift and magnificent bird with slate-grey back, blackish crown, black "moustache" and whitish breast. Other members of the family are the Gyr Falcon from northern latitudes, Iceland and Greenland, which is a winter visitor to Britain, the Lanner, Saker, Eleonora's falcon, Red-footed falcon, and the Lesser Kestrel. The Gyr Falcon and the Peregrine were used in the sport of falconry in olden times. Because of its fearlessness and larger size, the female bird was used. When the quarry was sighted, the bird was unhooded, set free, and after mounting high into the air would dart swiftly down to strike the prey. The heron was the usual victim.

Fall-out. Radioactive material produced by nuclear explosions which may cause bodily and genetic damage. (1) *Local fall-out*, due to the return to earth of larger particles, occurs locally, and within a few hours after the explosion; (2) *Tropospheric fall-out*, due to particles which remain in the troposphere and come down within a month or so, possibly all over the world, but within the altitude in which the explosion occurred; (3) *Stratospheric fall-out*, which comes from fragments taken up into the stratosphere and then deposited, in the course of many years uniformly all over the globe. The two radioactive materials which have given rise to the greatest concern for the health of the individual are strontium-90 and iodine-131. Both these materials are liable to become concentrated in certain parts of the human body, strontium-90 in bone and iodine-131 in the thyroid gland. Iodine-131 gives off radiation, but after a few weeks this becomes negligible; the risk is likely to be limited to children under one year old. Strontium-90 continues to give off radiation for many years, and particular attention is therefore paid to levels of strontium-90 in milk and in the bones of young children who are growing rapidly. Radiation exposure may produce genetic effects, that is effects which may show up in succeeding generations. So far as these genetic effects are concerned, the most important components of fall-out are caesium-137 and carbon-14.

Fallow Deer received its name from its fallow or yellow colour. It is smaller than the red deer, and has cylindrical antlers with palmated ends. It is native to many parts of Europe.

Fandango, a lively Spanish dance executed by two persons, who usually mark time with castanets.

Fantail, a variety of the domestic pigeon; also a genus of Australian birds of the *Muscicapidae* family. A small New Zealand bird is called a fantail.

Fan Tracery, a complicated style of roof-vaulting, elaborately moulded, in which the lines of the curves in the masonry or other material employed diverge equally in every direction. It is characteristic of the late Perpendicular period of Gothic architecture, and may be seen in St. George's Chapel at Windsor and the Chapel of Henry VIII, at Westminster Abbey.

Farmer-General, the name given to the financiers who in the days of the old French monarchy farmed certain taxes, contracting to pay the Government a fixed sum yearly, on condition that the specified taxes were collected and appropriated by themselves. The revolution of 1789 swept Farmers-General away.

Fascism. *See* J16.

Fata Morgana, the name given to a curious mirage often observed over the Straits of Messina, attributed to the magic of the fairy Morgana, half-sister of King Arthur, who was fabled to live in Calabria.

Fathers of the Church were early writers who laid the foundations of Christian ritual and doctrine. The earliest were the Apostolic Fathers, (*q.v.*). The Four Fathers of the Latin Church were St. Ambrose, St. Jerome, St. Augustine, and St. Gregory the Great. The Four Fathers of the Greek Church were St. Basil, St. Gregory Nazianzen, St. John Chrysostom, and St. Athanasius.

Fats are important foodstuffs. In physiology they constitute a valuable form of reserve food. They contain carbon, hydrogen and oxygen; chemically they are described as esters of

glycerol (glycerine). Commonest fats are stearin, palmitin, and olein, esters formed by the combination of glycerol with stearic, palmitic, and oleic acid respectively. Fats are converted into soap by alkali; this process (saponification) also releases glycerol.

Fault, a term designating a breakage coupled with displacement of geological strata.

Fauvism (Fr. *fauve* = wild beast), a term contemptuously applied to the work of a group of French painters led by Matisse who exhibited at the Salon d'Automne in Paris in 1905. Their belief was that a painting must be not only a consistent and harmonious decoration but the expression of an idea or feeling. Forms and colours are emotive in their own right. The objects painted by the Fauves, though simplified, distorted, and often violently coloured, are easily recognisable. Inspiration for their highly decorative canvasses came from many sources: Byzantine and Persian art in the case of Matisse; German Expressionism in the case of Derain and Vlaminck. The Fauves paved the way for the Cubists (Braque joined Picasso in 1909) who approached nature in more arrogant mood, from a more intellectual point of view.

February, the second month of the year, contains in ordinary years 28 days, but in leap years 29 days. When first introduced into the Roman calendar by Numa *c.* 700 B.C. it was made the last month of the year, preceding January, but in 452 B.C. the position of the two months was changed, February following January.

Federation. *See under* Confederation.

Félibrige, a movement founded in 1854 to revive the ancient glories of Provence, initiated by the French poet Frédéric Mistral.

Felspar, the name given to a group of minerals, silicates of aluminium with some calcium and sodium, or potassium, which make up probably more than half of the earth's crust. It is formed in granite and other rocks, both igneous and metamorphic.

Fenestella, the niche set apart on the south side of the altar for the piscina in Roman Catholic churches.

Fermentation, the action of chemical ferments or *enzymes* in bringing about chemical changes in the materials of living animals and plants, *e.g.*, the breaking-down of sugar by yeast into alcohol.

Ferret, a carnivorous animal of the Pole-cat family, with a pointed head and long sinuous body, well adapted for following rabbits and game into their burrows and hiding-places, it being kept in this country for that purpose. It is a native of Spain and Africa, and does not exist in England in a condition of natural freedom. *See* Z12.

Ferrites are compounds containing iron, oxygen, and one or two of a certain range of other possible metallic elements. Ferrites have recently become very important technically, because, unlike ordinary magnetic materials, they combine strong magnetism with electrical insulating properties. Ferrite-rod aerials are now common in portable radios, and ferrite devices are used in radar.

Feudalism. *See* J17.

Fieldfare, the largest member of the thrush family, a regular winter visitor to Britain from Scandinavia. It is brown in colour with a lighter spotted breast and a grey head.

Field-Marshal, the highest ranking title in the British army, and only bestowed on royal personages and generals who have attained great distinction. The first British Field-Marshal was created in 1736, when John, Duke of Argyll, had the title conferred upon him by George II.

Fifth Column. When Franco, the Spanish dictator, revolted against the Spanish Republic in 1936 and attacked Madrid with four armies, he declared that a group of fascists within the city was assisting the besiegers. The term is used to describe a body of spies behind a fighting front.

Fighting-Fish, small pugnacious Siamese fish with long caudal and ventral fins. They are kept in glass globes in Siam, and when brought into contact will fight to the death, these encounters being the occasion of much gambling.

Filibuster, a name first given to pirates and buccaneers in the 17th cent. who took possession of small islands or lonely coast lands, and there maintained themselves apart from any governing authority. In later times the term was used to specify men taking part in expeditions whose object was to appropriate tracts of country, and settle upon them in disregard of international law. The most notable expeditions of this kind in modern times were those of Narcisco Lopez against Cuba in 1850–51, and of William Walker against Nicaragua, between 1855 and 1860. Both leaders were captured and executed. The term is also used to express the right of a minority in the United States Senate for unlimited debate, which is used on occasions to delay legislation for an unlimited period.

Finches, a large family of small birds belonging to the Passerine or perching order of birds. There are about 200 species, including greenfinch, hawfinch, chaffinch, goldfinch, siskin, bullfinch, crossbill, linnet, twite, and buntings.

Fir, a cone-bearing tree with small evergreen leaves and of considerable use as timber. There are two types: the Silver Firs and the Douglas Firs numbering about 25 species. All these firs attain to a considerable height, and all yield turpentine or other resinous material.

Fire-Fly, a small winged insect of the *Eleteridae* family, is able to throw out a strong phosphorescent light in the dark. There are some remarkable specimens in tropical countries.

Fire of London, of 1666, extended from East to West, from the Tower to the Temple church, and northward to Holborn Bridge. It broke out in a baker's shop in Pudding Lane, and lasted four days, and destroyed 87 churches, including St. Paul's Cathedral, and many public buildings, among them the Royal Exchange, the Custom House, and the Guildhall. In the ruins were involved 13,200 houses and 400 streets. About 100,000 people were made homeless yet in about 10 years all the houses had been rebuilt. The plague had not disappeared from London when the fire occurred.

Firkin, a former measure of capacity, the fourth part of a barrel, now only used in reference to a small cask or tub for butter, lard, tallow, etc.

Fischer-Tropsch Process. A process for making synthetic petrol from carbon monoxide and hydrogen. The synthesis is accelerated by cobalt-thoria and nickel-thoria catalysts.

Fish Louse. Parasitic crustacea found on marine and fresh-water fishes and whales.

Fission, Nuclear. A nuclear reaction in which the nucleus of an atom (*e.g.*, uranium 235, plutonium) captures a neutron, and the unstable nucleus so produced breaks into two nearly equal fragments and throws out several neutrons as well. In biology the term fission is applied to reproduction by fragmentation of a single-cell organism, as in amœba. *See* F12(1).

Flagella, single hair-like projections found on many micro-organisms. Their sole function is, by complicated motion, to move the organism about. They are longer and less versatile than cilia (*q.v.*).

Flag Officer, a British naval officer who enjoys the right of carrying a flag at the mast-head of his ship, and is of the rank of Admiral, Vice-Admiral, or Rear-Admiral.

Flagship, the ship that flies the Admiral's flag, and from which all orders proceed.

Flamingo, a strangely beautiful, extremely slender wading bird of white and rose-pink plumage with long, slender legs and neck and a long, down-curved bill with which it rakes the mud and obtains its food of worms and molluscs. The wings are bright crimson, bordered with black, and a flock in flight is a picture of singular beauty. There is a large and famous colony in the Camargue.

Flash-Point. This is found by heating an oil in a special cup and taking the temperature at which sufficient vapour is produced to ignite when a small flame is applied. It is an index of the inflammability of oils.

Flea. Fleas are small parasitic insects belonging to the order *Aphaniptera* (so called because these creatures have no wings). They obtain their food by sucking blood from their host. They are laterally compressed, which immediately distinguishes them from lice. The human flea

(*Pulex irritans*) is able to jump vertically a distance of over 7 in.

Fleet Prison, a noted debtors' prison that stood in Farringdon Street, London, where the Congregational Memorial Hall now stands, taking its name from the Fleet Ditch. Notorious for the cruelties inflicted on prisoners. It was pulled down in 1846.

Fleet Street, a famous thoroughfare in London, now the centre of journalism and newspaperdom, though it was long celebrated for its taverns where the literary coteries of the day were wont to meet. It takes its name from the Fleet stream which used to run from Hampstead through Holborn to the Thames at Blackfriars.

Flemings, the people of Flanders, whose ancestors of mediaeval times excelled in the textile arts; England owes its early eminence as a manufacturing nation to the migration of numbers of Flemings to this country in the 16th and 17th cent. *See also* Walloons.

Fleur de Lis, the former national emblem of France, the flower of the lily. It was superseded by the Tricolour in 1789, but is still adhered to by the supporters of the old French royalties.

Flint, consists of granular chalcedony with some opaline silica, and occurs as nodules and bands in the Chalk. It is hard and has a conchoidal fracture, so enabling it to be used in making cutting implements in prehistoric times. Before the invention of lucifer matches, it was used along with steel for striking lights.

Flint implements are objects found in the younger geological strata, and constituting evidence of the condition and life of the period. They include knives, clubs, arrow-heads, scrapers, etc., used as weapons, tools and possibly as surgical instruments and in religious ceremonies. At the end of the Neolithic Period and the beginning of the Bronze Age a people using a new type of stone axe became evident in Europe, advancing towards the south and central regions, and supposed by many to be the ancestors of the present European stock, or Aryans. Similar to prehistoric specimens are the flint and obsidian implements of some of the primitive peoples of today. Ritual weapons and sacrificial knives continued to be made of stone long after the introduction of metals for practical purposes.

Flounder, one of the most familiar of the smaller flat fishes common round the British coasts, and seldom attaining a weight of over three pounds.

Fluorine, a chemical element, member of the halogen family, symbol F, it is found in combination with calcium in fluorspar, and occurs in minute quantities in certain other minerals. Discovered by Scheele in 1771, it was first obtained by Moissan in 1886. A pale yellow gas, it is very reactive and combines with most elements except oxygen. Its acid, hydrogen fluoride, etches glass, the fluorine combining with the silicon to form volatile silicon fluoride. Organic fluorine compounds have found use as very stable polymers which resist a wide variety of chemical actions.

Fluorescent Lamp. *See* **Electric Light** and **Ultra-Violet Rays.**

Fluorspar, a mineral; chemically, calcium fluoride. Can be colourless, green, or yellow, but is most commonly purple. Blue fluorspar under the name of Derbyshire "blue John" has been used for ornamental purposes.

Fly, the popular name for a large number of insects with one pair of wings and a proboscis terminating in a sucker through which fluid substances can be drawn up. The best-known species are the common house-fly, the bluebottle, and the blow-fly. In the larval form flies are maggots, and feed upon decaying substances, animal flesh, etc. Flies are able to walk upon ceilings or upright surfaces by having suckers at the soles of their feet. *See* Diptera.

Flycatcher, name of a large family of small birds, the *Muscicapidae*. They are insect feeders, catch their food in the air, and are distributed over most countries of the world. The spotted and the pied nest in Britain, which they visit from April to September.

Flying Fish are frequently to be seen in southern waters, and are capable of gliding considerable distances without touching the water. To build up speed for its "take-off" the fish swims rapidly, to break the surface at 15–20 miles an hour. Maximum air speed is about 40 m.p.h.

Flying Fox, a member of the bat family, but of much larger size, and confined to the tropical and sub-tropical Old World. Like the bats, it is nocturnal, but it feeds entirely on fruits.

Flying Lemur. *See* Colugo

Flying Lizard, or *Draco*, an Asiatic lizard, possessing wing-like projections from each side, which enable it to make flying leaps through the air, though not sufficient for continuous flight.

Flying Saucers, the name given to certain saucer-like shapes which have on occasion been seen travelling through the atmosphere. For some time speculation was rife, especially in America, but it is now believed that when not hallucinations, meteorological or cosmic-ray balloons, they are nothing more than atmospheric phenomena like mirages or mock suns caused by unusual atmospheric conditions. Described by Dr. Menzel, astrophysics professor at Harvard, "as real as rainbows are real, and no more dangerous". It has been suggested that the study of some of the people who report the sighting of unidentified flying objects (UFOs) would be more rewarding than the investigation of what they saw!

Flying Squirrel, rodents of which there are several species in Europe, Asia and America. It possesses a parachute-like fold of skin by means of which it projects itself through the air. In appearance they are much like ordinary squirrels, to which they are related. The African flying squirrels belong to a different family.

Fog is caused by the presence of particles of condensed water vapour or smoke in the surface layers of the atmosphere, the term being applied meteorologically when the resulting obscurity is such as to render objects invisible at distances of up to 1 km. Fogs are frequently formed when the air near the ground is cooled below its dew-point temperature by radiation on a still, cloudless night; by flowing over a relatively cold land or water mass; or by mixing with a colder air stream. An accumulation of smoke over a large city may cause a high fog cutting off the daylight and producing gloom. *See* **Pollution** *and also* **Aerosol.**

Foliation, a geological term applied to rocks whose component minerals are arranged in parallel layers as the result of strong metamorphic action.

Folio, a printing term for a sheet of paper folded once, a half sheet constituting a leaf.

Folklore concerns itself with the mental and spiritual life of the people—both civilised and primitive—as expressed in the traditional beliefs, customs, institutions, and sayings that have been handed down from generation to generation by word of mouth and with the observation recording, and interpretation of such traditions. (The word *folklore* itself was first suggested and used—as two words *Folk Lore*—by W. J. Thoms in the *Athenæum* of August 22nd, 1846, and was at once absorbed into the English language.) Traditional lore of the kind included in the term folklore takes many forms and ranges from omens of good and bad luck (spilling the salt breaking a mirror, dropping an umbrella, etc.) and the wearing of amulets or the possession of talismans (such as the horseshoe) as protection against misfortune, to elaborate ceremonial dances such as the Abbots Bromley Horn Dance, the Hobby horses of Padstow and Minehead, the Northern sword-dances, and the Christmas mummers' plays. Especially important are the beliefs and customs associated with birth, babyhood, marriage, and death such being occasions when the individuals concerned require special protection or when unusual happenings can be used for foretelling their future. The child born on a Sunday will be the luckiest; rocking an empty cradle will ensure the speedy arrival of a new baby; throwing an old shoe after a newly-married couple brings them luck; the bride should be carried over the threshold of the new home; on the sea-coast, death is believed to take place at the ebb-tide; the bees must be told of the death of the master of the house, or they will leave the hive. Another very large section of the subject deals

with the traditional sayings and practices associated with particular days and seasons of the year—calendar customs, as they are called. The eating of pancakes on Shrove Tuesday; Mother Sunday customs and the simnel cake; Good Friday as the right day for planting potatoes, but emphatically the wrong day for washing clothes or cutting one's finger-nails; the necessity of wearing something new on Easter Sunday; the children's maypole dances and May garlands; midsummer fires; All Hallowe'en as the most favourable occasion for divining the future—especially in respect of marriage—and for games and sports such as apple-bobbing; the numerous practices accompanying the harvest. All these are examples of calendar customs; their full story would occupy several volumes. Folklorists are interested in all such oral tradition because they think that to a large extent it represents what folk have mentally stored up from the past and transmitted to their descendants throughout the centuries, and because therefore it is able to assist other historic methods—ethnographical linguistic, archaeological, etc.—in the elucidation of the early story of man. In those countries with a great diversity of peoples in all stages of culture, a knowledge of folklore and what it can teach of the mind of man is of great importance to administrators. The Folk-Lore Society was founded in 1878, and that part of the subject represented by song and dance has now its own organisation in the English Folk Dance and Song Society.

Force, as a term in physics, signifies an influence or exertion which, when made to act upon a body, tends to move it if at rest, or to affect or stop its progress if it be already in motion. In the c.g.s. system, the unit of force is the dyne; in the foot-pound-second system, the poundal; in the SI system, the newton. *See* N14.

Formaldehyde. Chemically it lies between methyl alcohol and formic acid; oxidation of methyl alcohol yields formaldehyde, and oxidation of formaldehyde produces formic acid. It is used as a disinfectant, in silvering mirrors, and in the manufacture of phenol-formaldehyde plastics (of which bakelite is the best-known example). Solutions of formaldehyde in water, formalin, are used to preserve biological specimens.

Forme, a body of letterpress type, composed and secured for printing from; or a stereotype or electrotype. The former is used more for newspaper formes and the latter in good book work.

Formic Acid can be obtained from a colourless fluid secreted by ants and other insects and plants. It is a strong irritant. Commercially it is obtained from sodium formate, which is synthesised by the absorption of carbon monoxide in caustic soda. It is used in the electroplating, tanning, and textile industries.

Formula, in mathematics and physics a statement of certain facts in symbolical form. In chemistry a representation of the composition of a compound.

Fossils. Remains of animals and plants, or direct evidence of their presence, preserved in rocks. They include petrified skeletons and shells, leaf imprints, footprints, etc.

Four Freedoms, a phrase coined by President Roosevelt in January, 1941, embodying what should be the goal of the Allies. They were (1) Freedom of speech and expression; (2) Freedom of every person to worship God in his own way; (3) Freedom from want; (4) Freedom from fear.

Fox, carnivorous animal of the canine family, found in considerable numbers in most parts of the world. The common fox *Vulpes vulpes* of Europe is a burrowing animal of nocturnal habits, living upon birds, rabbits, and domestic poultry, in the capture of which it displays much cunning. The fox in Britain is preserved from extinction chiefly for hunting purposes. Among other notable species are the Arctic fox and the red fox of North America, of which the valuable silver fox, coveted for its fur, is a variety.

Fox-Shark, *or* **Thresher Shark**, a large species of shark common in the Atlantic and in the Mediterranean. It is very destructive to small fish, but although it attains a length of 15 ft. it is not dangerous to man.

Franciscans. *See* **Friars.**

Franco-German War (1870–71) was opened by a declaration of war by Napoleon III., but the Germans who were better prepared than the French, won victory after victory. In September Napoleon and the whole French army were made prisoners at Sedan, a republic was then proclaimed, and Paris sustained a four months' siege. In the end France ceded Alsace and part of Lorraine to Germany, who claimed a war indemnity of over £20 million.

Francolin, a genus of birds closely related to the common partridge, belonging to Africa. It includes the spur-legged partridge, and the black partridge which ranges from Cyprus to Assam.

Frankincense is of two kinds, one being used as incense in certain religious services and obtained from olibanum, an Eastern shrub, the other is a resinous exudation derived from firs and pines, and largely used in pharmacy.

Franklin, the name given in feudal times to a country landowner who was independent of the territorial lord, and performed many of the minor functions of local government, such as serving as magistrate.

Fresco, a painting executed upon plaster walls or ceilings, a technique which has remained unchanged since it was practised by the great Renaissance artists.

Freshwater Shrimp, a small crustacean abounding in British streams, and feeding on dead fish or other decomposing matter. Although of shrimp-like form it is not closely related to salt-water shrimps. Its generic name is *Gammarus*.

Friars, members of certain mendicant orders of the Roman Catholic Church. The four chief orders are the Franciscans or Grey Friars, the Dominicans or Black Friars, the Carmelites or White Friars, and the Augustinians (Austin Friars).

Friday, the 6th day of the week, named after Frigga, the wife of Odin. It is the Mohammedan Sabbath, a general abstinence day of the Roman Catholic Church, and according to popular superstition, an unlucky day.

Friends, The Society of. *See* J17.

Frigate-Bird, a web-footed bird widely distributed over tropical latitudes, and deriving its name from its great expanse of wing and forked tail, resembling the shape of a swift vessel. It feeds on flying fish mostly, being unable to dive and also steals from other birds. A frigate-bird was found dying on the Hebridean island of Tiree in July 1953; only twice previously had one been recorded in Europe—the first on the German coast in 1792, and the second on the coast of France in 1902.

Frog, a familiar amphibian, breathing through gills in the earlier (tadpole) part of its existence, and through lungs later. It remains three months in the tadpole stage. The frog hibernates underwater in the mud during the winter.

Frost occurs when the temperature falls to, or below, 0° C., which is freezing point. Hoar frost is applied to the needles or feather-like crystals of ice deposited on the ground, in the same manner as dew. Glazed frost is the clear icy coating which may be formed as a result of rain falling on objects whose temperatures are below the freezing point. These layers of ice, often rendering roads impassable for traffic, damaging overhead power and communication systems and endangering aircraft, can also be caused by condensation from warm, damp winds coming into contact with very cold air and freezing surfaces.

Froth-Hopper *or* **Frog-Hopper.** A family of bugs (belonging to the insect order *Hemiptera*) which in the larval stage surround themselves with a protective mass of froth ("cuckoo spit"). These insects, which suck the sap of plants, bear a faint resemblance to frogs, and the adults possess great leaping powers.

Fuel Cells. A recent development is a type of battery into which the active chemicals are fed from external fuel tanks. This is the *fuel cell*, which is being developed in a number of versions in several countries. One was demonstrated in action when in 1959 Bacon of Cambridge University used his fuel cell to drive a fork-lift truck and a welding machine. The Bacon fuel cell consists of two electrodes of porous nickel dipping into a solution of caustic potash in water. One electrode is supplied with

hydrogen gas from an outside cylinder and the other with oxygen. These gases, forming layers on the nickel, are the active chemicals. The oxygen combines with water to make two negatively charged ions, each consisting of an oxygen and a hydrogen atom joined together (a hydroxyl ion). The hydroxyl ions travel through the solution to the hydrogen electrode, where they combine with hydrogen to form neutral water. Their negative charge (one electron per ion involved) has now arrived at the hydrogen electrode and is ready to flow back to the other electrode through any outside circuit that is provided. This flow constitutes the useful electric current, and it has been provided at the expense of creating water out of the original hydrogen and oxygen. The water can be removed in the form of steam. What is the advantage of all this? In the first place the fuel gases are easy to make and to store in cylinders. Supplying a new gas cylinder is easier and quicker than recharging an ordinary accumulator. Furthermore, a fuel cell is lighter for a given power than an accumulator; satellite designers have found them useful. The fuel cell is not damaged by heavy overloading, and this is valuable for application to vehicle driving. Fuel-cell-driven buses could combine the advantages of diesel buses and trolleybuses. Fuel cells are still in the development stage. It is not certain how they will compete with combustion engines or, in the oil-less future, with improved ordinary batteries.

Fulani, a non-Negro people of Hamitic stock widely distributed in N.W. Africa, chiefly in Nigeria. There are two main branches: the dark-skinned Fulani, settled farmers and city dwellers, Moslem in religion, and the light-coloured Bororo'en who are semi-nomadic herdsmen. The Fulani are different from any tribe in W. Africa though they resemble in some ways the Masai of E. Africa. The Fulani conquered the Hausa states at the beginning of the 19th cent. which passed under British suzerainty after 1903. Sokoto, built in 1810, was capital of the Fulani empire.

Fuller's Earth, a special kind of clay or marl possessing highly absorbent qualities, originally used in the "fulling"—that is, cleansing and felting—of cloth. Now used in clarifying oils. Deposits in America and in south of England.

Function. In mathematics, one quantity y is said to be a function of another quantity x, written $y = f(x)$, if a change in x results in some corresponding change in y. Thus $\sin x$ or $\log x$ are functions of x. If y depends not only on x but on several other quantities as well, y is called a function of many variables.

Functionalism, in architecture, a movement originated by Le Corbusier, Swiss-born French architect and town-planner, who applied the austere principles of the Purist movement in painting to his own art. From about 1924 he designed in concrete, steel, and glass, buildings in which every part had a significance in terms of function on the theory that objects created to carry out their particular function to perfection cannot help being beautiful. "A house is a machine for living in." The style was in vogue between the two wars, and although its severity became somewhat modified, it is still the basis of most modern architecture.

Fungi, a class of simple plants, which reproduce from spores and lack the green colouring matter *chlorophyll*. It includes moulds, rusts, mildews, smuts, mushrooms, etc. Potato blight is a fungus disease which caused the failure of the potato crop in Ireland in 1846. 50,000 different fungi are known. *See also* F32(2), P8(1).

Furniture Beetle (*Anobium punctatum*). The common furniture beetle is responsible for 80 per cent of all woodworm damage and is the great pest of the comparatively modern house, causing damage in the main to softwood roofing and flooring timbers. Adults one-eighth of an inch long. The grub tunnels for about 33 months. *See also* Woodworm, Death Watch Beetle.

Futurism, the only important modern art movement to arise outside France, initiated by Marinetti, an Italian writer and mountebank friend of Mussolini at a later period. Its origin took the form of a manifesto published in Paris in 1909 in which Marinetti glorified violence, war, and the machine age. In its aggression it favoured the growth of fascism. One of the distinctive features of Futurist art was the use of the principle of "simultaneity" in which the same figure (*e.g.*, a woman descending a flight of stairs) is represented in successive positions like film "stills" superimposed on each other. In spite of two further manifestos it was not until 1911 that the first examples of Futurist painting and sculpture appeared by the artists Severini, Balla, and Boccioni. Apart from the principle of simultaneity, Futurism derived from Cubist and Post-impressionist techniques. The movement faded out early in first world war.

G

Gabardine, a long, loose, coarse, over-garment, worn by men of the common class in the Middle Ages, and prescribed by law as the distinctive garment of the Jews. The name is now given to a closely woven cloth of wool and cotton used to make raincoats.

Gabbro, a kind of igneous rock, often very coarse-grained, containing a good deal of plagioclase felspar, and monoclinic pyroxene; it may occasionally also include biotite, magnetite, ilmenite, and hornblende. A gabbro containing nickel at Sudbury in Canada is one of the richest sources known of that metal.

Gadfly, a widely distributed family of flies with only one pair of wings, including the horse fly. The females are very voracious, being able to bite through the skin and suck the blood of animals. The males are harmless.

Gadolinium. An element belonging to the rare-earths metals discovered in 1886 by Marignac. It is strongly magnetic.

Gaelic, relating to the Gaels and their language, a term now applied only to the Celtic people inhabiting the Highlands of Scotland, but formerly also to the Celts of Ireland and the Isle of Man.

Galago, "Bush Babies," related to the lemur, native to Africa, large-eyed, in keeping with its nocturnal characteristics.

Galaxy *or* **Milky Way Galaxy** is the huge disk-shaped cloud of gas and stars (some 100,000 million, one of which is the sun) that is turning in space like a great wheel, with a diameter of about 100,000 light years. The Milky Way (that part of the heavens in Milton's words "powdered with stars") is really only a small part of this disk, and every star in the galaxy is moving round the centre under the gravitational control of the whole. The sun and planets lie near the edge of the disk, and it takes them about 250 million years to travel once round. The number of stars that can be seen with the unaided eye is about 3,000, and they all belong to the Milky Way Galaxy, as do most of the stars that can be seen with anything but the greatest telescopes. With the large modern optical and radar telescopes many other systems, similar in size and weight to our galaxy, have been discovered, scattered more or less uniformly through space, and the universe is said to include at least 10,000 million such galaxies. *See also* F3–6.

Gale, a high wind now technically defined as one of at least Beaufort force 8. Between thirty and forty gales a year occur on the north and west coasts of the British Isles and only about half of this number in the south-east. At St. Ann's Head, Pembroke, the anemometer registered a gust of 113 m.p.h. on Jan. 18, 1945, which is a record for these islands. Gusts exceeding 70 m.p.h. are rarely experienced in London. Gale warnings are issued for specified areas by the Meteorological Office, the warnings taking the form of radio broadcasts and the hoisting of storm signals at certain points on the coast. *See* Beaufort Wind Scale, N33.

Gall, abnormal vegetable growths caused by insects, mites, bacteria, or fungi, found on all parts of the plant. Oak-apples, Robin's pincushion (on wild rose), "witches brooms" (on trees) are examples. Some are useful commercially, *e.g.*, oak apples yield tannic acid and the black oak gall is used in America as animal food.

Galleon, the name given to the old three-decked Spanish treasure vessels employed in conveying the precious minerals from the American

colonies to Spain. The term is often applied to any large, especially stately, sailing vessel.

Galley, an oar-propelled sea-boat used by the ancient Greeks and Romans for transport purposes, manned by slaves. Boats of a similar class were used by the French down to the middle of the 18th cent., and manned by convicts.

Gallic Acid, obtained from gall nuts, sumach, tea, coffee, and the seeds of the mango, is used in the manufacture of inks and as an astringent in medicine. It was discovered by C. W. Scheele (1742–86), a Swedish chemist.

Gallium, a white metal, symbol Ga, related to aluminium, but which can be cut with a knife. It was discovered spectroscopically by L. de Boisbaudran in 1875. Long before Mendeleyev had predicted that an element with its properties would be found to fill the then existing gap in the Periodic Table; this gap came immediately below aluminium, so he suggested the name "eka aluminium" for it.

Gallup Poll, a system, introduced by Dr. Gallup of the United States, for testing public opinion on topical subjects by taking a test poll on questions framed to elicit opinions.

Galvanised Iron is iron coated with zinc. The name comes from the fact that such a coat protective against rust could be deposited electrolytically. Electrodeposition is sometimes used, but the cheaper and more common process depends on dipping the iron in a bath of molten zinc.

Gamboge, a resinous gum obtained from the sap of *Garcinia morella*, a tree native to Thailand, Cambodia, and Ceylon, and used as a yellow pigment in paints and also as a purgative.

Game is the term applied to wild animals which are protected from indiscriminate slaughter by Game Laws. In the United Kingdom game comprehends deer, hares, pheasants, partridges, grouse, black game, moor game, woodcocks, bustards, and certain other birds and animals of the chase. Game can only be killed (with few exceptions) by persons holding game licences. Occupiers of land and one other person authorised by them in each case are allowed to kill hares and rabbits on their land without licence. Game cannot be sold except by a person holding a proper licence. There is a "close time" prescribed for the different classes of game; for instance, the selling or exposing for sale of any hare or leveret during March, April, May, June, or July is prohibited by law. Grouse cannot be shot between Dec. 11 and Aug. 11; patridges between Feb. 2 and Aug. 31; pheasants between Feb. 2 and Sept. 30; and black game between Dec. 11 and Aug. 10. In regard to foxes, stags, and otters, custom and not Parliament prescribes a certain law which sportsmen rigidly adhere to. Game reserves are legally protected areas where natural vegetation and wild life are allowed to remain unmolested by sportsmen or those who might destroy for economic ends. *See* British Game Seasons, N25.

Gaming, *or* **Gambling**—*i.e.*, staking money on the chances of a game—differs from betting in that it depends upon the result of a trial of skill or a turn of chance. The Betting and Gaming Act of 1959, passed by the Macmillan administration, replaced all the old laws on gaming, which went back to an Act of 1541 entitled "An Acte for Mayntenance of Artyllarie and debarringe of unlauful games," under which some games were unlawful if played for money in any circumstances. Roulette and any game of dice were among such games. Under the 1959 Act any game was lawful, subject to certain conditions. The Labour Government is bringing in a new Gaming Bill to prevent the exploitation of gaming by commercial interests.

Gammexane, a powerful insecticide, used particularly to kill the tsetse fly and mosquito.

Gamut. The set of lines and spaces on which music is written.

Gangue. Useless minerals associated with metallic ores.

Gannet, a fish-eating bird which dives on its prey from a great height, swallowing it under water; is found in large numbers off the coast of Scotland, and has breeding stations in the Hebrides, St. Kilda, Ailsa Craig, the Bass Rock, Grassholme Island, and on Ortac and Les Etacs (rocks off Alderney). It is a bird of white plumage, black tips to long narrow wings and wedge-shaped tail, and weighs about 7 lb. The gannet breeds in colonies on ledges of steep, rocky, island cliffs. Related to the cormorants, pelicans, and frigate-birds.

Garden Cities in England were founded by Ebenezer Howard (1850–1928), and his ideas were put forward in his book *Tomorrow—A Peaceful Path to Real Reform* (later re-issued as *Garden Cities of Tomorrow*). New towns should be so placed and planned as to get the best of town and country life, an adaptation of the model villages of certain industrial philanthropists such as Salt, Richardson, Cadbury, Leverhulme, and others. The Garden City Association (later the Town and Country Planning Association) was formed in 1899, and the first garden city was begun at Letchworth in 1904 and successfully established. Welwyn Garden City was also Howard's foundation, established in 1919.

Gardener-Bird, a bird possessing many of the characteristics of the bower-bird, and found only in Papua–New Guinea. *See also* Bower Bird.

Gargantua, the giant hero of Rabelais' satire, of immense eating and drinking capacity, symbolical of an antagonistic ideal of the greed of the Church.

Gargoyle, a projecting spout for carrying off water from the roof gutter of a building. Gargoyles are only found in old structures, modern water-pipe systems having rendered them unnecessary. In Gothic architecture they were turned to architectural account and made to take all kinds of grotesque forms—grinning goblins, hideous monsters, dragons, and so forth.

Garlic, a bulbous plant of the same genus as the onion and the leek, and a favourite condiment among the people of Southern Europe. It possesses a very strong odour and pungent taste and its culinary use is agelong.

Garnet, a group of minerals; chemically they are orthosilicates of the metals calcium, magnesium, titanium, iron, aluminium. Garnets can be coloured yellow, brown, black, green, or red; the blood-red garnet is an important gemstone.

Garrotte, a method of strangulation used as capital punishment in Spain, and consisting of a collar which is compressed by a screw that causes death by piercing the spinal marrow. Garroting was also applied to a system of highway robbery common in England in 1862–63, the assailants seizing their victims from behind, and by a sudden compression of the windpipe disabling them until the robbery was completed.

Garter. The Most Noble Order of the Garter was founded (*c.* 1348) by King Edward III., and is the premier order of knighthood in Great Britain. The traditional story associating the garter and the motto with the Countess of Salisbury, who it was said dropped her garter while dancing with the King, who remarked "honi soit qui mal y pense" cannot be accepted. The order was originally limited to the Sovereign and 25 knights, but the number has been extended, and it may now be bestowed on royal personages and leading representatives of the British peerage. The insignia of the order are the garter of dark-blue velvet with the motto in letters of gold, the mantle of dark-blue velvet lined with white silk, the surcoat and hood, and the gold-and-enamel collar. The garter is worn on the left leg below the knee and by women as a sash over the left shoulder. *See* Knighthood.

Gas is an elastic fluid substance, the molecules of which are in constant rapid motion, and exerting pressure. The technique whereby gases are liquefied depends on increasing pressure and diminishing temperature. Each gas has a critical point; unless the temperature is brought down to this point no amount of pressure will bring about liquefaction. Last gas to be liquefied was helium (1908) which boils at —209° C. *See* F16(2).

Gas from coal was first used as an illuminating agent by William Murdoch towards the end of the 18th cent. in Birmingham, and about 1807 was introduced in London, one side of Pall Mall being lighted with it. It became widely used as an illuminant, and for space heating and cook-

ing. Processes to convert fuel oil to gas have been developed in recent years. In the United Kingdom there has been increasing attention paid to the possibility of using a primary fuel—natural gas—instead of producing gas from coal or oil. *See* **Gas, Natural.**

Gas, Natural, natural mixture of gases often present with deposits of petroleum, found issuing from the ground in many parts of the world—in the oilfields of Venezuela and the Caucasus, in China, Saudi-Arabia, but chiefly in North America. Its chief component is methane. Large industrial centres have made use of this gas since the latter part of the 19th cent., but much of this valuable fuel still goes to waste. Pipelines have been constructed to deliver the gas to where it is wanted. Britain began to ship liquid methane from the Saharan oilfield in 1964. Natural gas reserves have recently been discovered in the North Sea and are being actively exploited. Domestic gas appliances have to be modified if the natural product is substituted for ordinary town gas because the burning characteristics are different.

Gas Turbine. In this kind of engine mechanical movement is produced by a jet of gas impinging on a turbine wheel; used in aeroplanes, locomotives, and ships. These engines are mechanically simple compared with internal combustion engines, and require less maintenance. It has been stated that the jet-propelled Comet cruises at 450 m.p.h. burning less than ½ lb. of kerosene per passenger mile.

Gauge, a standard dimension or measurement, applied in various branches of construction. Thus, the standard railway gauge is 4 ft. 8½ in. in the United Kingdom, United States, Canada, France, Germany, Austria, Holland, Egypt, Belgium, Denmark, Italy, Hungary, Sweden, Switzerland, and Turkey. In India, Ceylon, and Spain the gauge is 5 ft. 6 in. In Soviet Russia and Finland, 5 ft., Ireland, 5 ft. 3 in. Narrow railway gauges of different standards are in use on very steep inclines in various countries. Other standard gauges are fixed in building and gun-boring.

Gauls were inhabitants of ancient Gaul, the country which comprised what is now France, Belgium, and parts of the Netherlands, Switzerland, and Germany.

Gault, a stratum of blue clay between the Lower Greensand and the Chalk. A typical section of the Gault can be seen at Folkestone.

Gauss, a unit of magnetic induction in the c.g.s. system, named after the great German mathematician and astronomer, K. F. Gauss.

Gavelkind, an old English custom of land tenure in Kent and other places in England, whereby on the death, intestate, of a property owner, his property is divided equally among his children and not according to the law of primogeniture. Abolished by the Law of Property Act, 1922, and the Administration of Estates Act, 1925.

Gazelle, an animal of the antelope family, of small and delicate shape, with large eyes and short cylindrical horns. It is of a fawn colour, a native of North Africa, and easily domesticated.

Gecko, the name of a family of drab lizards common in or near the tropics. They are nocturnal, insectivorous, and harmless.

Geiger Counter, an electrical device, invented by Geiger, which can detect individual atomic particles, *e.g.*, electrons, protons, etc. It often consists of a tube of gas at a few cm. Hg pressure, fitted with two electrodes—a cylinder and an axial wire. A high voltage is kept across the electrodes, and the passage of a charged particle through the gas releases ions which permit a momentary discharge between the electrodes. Electronic circuits register this discharge as a "count." Geiger counters are widely used to detect and measure radioactivity and cosmic rays, both for technical and research purposes.

Gelatine, a transparent, tasteless, organic substance obtained from animal membranes, bones, tendons, etc., by boiling in water. It is of various kinds, according to the substance used in making it. Isinglass, the purest form of it, is made from air-bladders and other membranes of fish, while the coarser kind—glue—is made from hoofs, skin, hides, etc. Its constituents are carbon, hydrogen, oxygen, and nitrogen. Gelatine is applied to an immense variety of purposes, from the making of food jellies to photographic materials.

Gemsbok, a large South African antelope, with long straight horns and tufted tail. Light fawn in colour, it has a black streak across its face, and is very fleet of foot.

General, a military title next in rank to that of Field-Marshal, the highest officer in the army. Ranking below full General are Lieutenant-General, Major-General, and Brigadier.

Generation, a time-measure reckoned at about 30 years when children are ready to replace parents; also the body of persons existing at the same time or period.

Generation, Spontaneous. *See* **Abiogenesis.**

Genes, the elementary units of heredity. They exist as highly differentiated regions arranged along the length of the chromosomes which the nuclei of cells carry. A chromosome may carry hundreds or even thousands of genes, each with its own particular structure and specific properties. The position of a particular gene on a chromosome is called its locus. *See* **Cell Division, F23(2).**

Genesis, the first book of the Pentateuch, compiled in the 5th cent. B.C. from earlier documents, which carries the scriptural narrative from the creation to the death of Joseph. Sometimes there is disagreement, as in the story of the creation, Gen. i and ii. Gen. i reflects the views of the ancient Greek scientist Thales (*c.* 640–546 B.C.) and may be said to be the first scientific account of the creation of the world. The conditions described around the figures of Abraham, Isaac, Jacob, and Joseph have a genuine historical basis.

Genet, one of the smaller carnivorous animals, about the size of a cat, but with longer tail and spotted body. It is a native of Southern Europe, North Africa, and Western Asia, and is valued for its fine soft fur, and also for a perfume it produces.

Geneva Convention, an agreement made by the European Powers at Geneva in 1864, establishing humane regulations regarding the treatment of the sick and wounded in war and the status of those who minister to them. All persons, hospitals, hospital ships are required to display the Geneva cross—a red cross on a white ground. A second conference held at Geneva in 1868 drew up a supplementary agreement. An important result of this Convention was the establishment of the Red Cross Society in 1870.

Genouillières, ancient metal caps for covering the knees of an armed man; an example may be seen on the Black Prince's monument in Canterbury Cathedral.

Genre, an art term used to describe a style of painting which deals with subjects of homely life, but also applied to other kinds of paintings, *e.g.*, genre du paysage (landscape painting), genre historique (historical painting).

Gentian, the name for plants of the *Gentiana* genus, many of which have intensely blue flowers. The gentian-root of *G. lutea* is used in pharmacy.

Genus, a term applied in biology to designate a group of similar species. A group of similar genera is called a family.

Geodesy, the science of calculating the configuration and extent of the earth's surface, and determining exact geographical positions and directions, with variations of gravity, etc. Land-surveying is a branch of geodesy.

Geography, the science which describes the earth's surface, its physical peculiarities, and the distribution of the various animals and plants upon it. It is usual to divide the subject into two main branches—physical geography, which deals with the composition of the earth's surface and the distribution of its living occupants, animate and inanimate; and human geography, which includes economic, political, and social geography.

Geology, the science which deals with the condition and structure of the earth, and the evidence afforded of ancient forms of life. The geological strata are classified in the following categories: *Primary* or *Palaeozoic* (the oldest fossil-bearing rocks including the Cambrian, Ordovician, Silurian, Devonian, Carboniferous, Permian); *Secondary* or *Mesozoic* (Triassic, Jurassic, Cretaceous); *Tertiary* or *Cainozoic* (Eocene, Oligocene, Miocene, Pliocene, Pleisto-

cene): *Post tertiary* (most recent rocks). *See* F34.

Geometrical Progression is a term used to indicate a succession of numbers which increase or decrease at an equal ratio—as 3, 9, 27; or 64, 16, 4.

Geometry is the branch of mathematics which demonstrates the properties of figures, and the distances of points of space from each other by means of deductions. It is a science of reason from fundamental axioms, and was perfected by Euclid about 300 B.C. The books of Euclid contain a full elucidation of the science, though supplemented in modern times by Descartes, Newton and Carnot. Of recent years non-Euclidean geometry has been developed.

Geophysics, the branches of physics which are concerned with the earth and its atmosphere. Meteorology, geomagnetism, aurora and air-glow, ionosphere, solar activity, cosmic rays, glaciology, oceanography, seismology, nuclear radiation in the atmosphere, rockets, and satellites—all these are geophysical subjects. The object of the International Geophysical Year, 1957–58, was to investigate the physical phenomena occurring on and around the earth by means of carefully co-ordinated observations made simultaneously all over the globe. *See also* F9(1).

George-Noble, a gold coin, so called from St. George and the dragon depicted on its obverse. First issued in the reign of Henry VIII.

German Silver, an alloy of copper, zinc, and nickel, and used in the manufacture of table-ware, such as spoons, forks, etc.

Germanium. A grey, hard, brittle chemical element, symbol Ge, chemically related to silicon and tin. Discovered by Winkler in 1886. Its richest ore is germanite containing 6% of the metal. Coal is also a relatively rich source. Since 1948 it has assumed great importance as a semi-conducting material for making transistors (*q.v.*). Because of this it has been so intensively studied that more is known about its physical properties than about those of any other element.

Gesta Romanorum (Latin = deeds of the Romans), a mediaeval collection of Latin stories of unknown authorship which circulated widely in Europe during the Middle Ages. First printed in the 15th cent. The stories were used by Chaucer, Shakespeare and other writers who found many romantic incidents and legends which they were able to turn to good account.

Gestation, the carrying of young in animals during pregnancy, varies considerably in its length. In the case of an elephant, the period is 21 months; a camel, 12 months; a cow, 9 months; a cat, 8 weeks; a horse, 48 weeks; a dog, 9 weeks; and a pig, 16 weeks. Hens "sit" for 21 days; geese, 30; swans, 42; turkeys, 28; pigeons, 18.

Geysers, hot springs of volcanic origination and action, are remarkable for the fact that they throw out huge streams of boiling water instead of lava as in the case of a volcano. The most famous geysers are those of Iceland, which number over a hundred, the principal one having an opening 70 ft. in diameter and discharging a column of water to a height of 200 ft. There are also geysers in the Yellowstone region of America, and some in New Zealand. Also a device now in common domestic use for heating running water quickly by gas or electricity.

Ghost-Moth or **Ghost Swift**, an interesting nocturnal insect (*Hepialus humuli*), common in England, possessing in the male a white collar and known for its habit of hovering with a pendulum-like action in the twilight over a particular spot where the female is concealed.

Giambeaux, metal armour for the legs and shins, worn by the warriors of Richard II.'s reign.

Gibbon, the name of a long-armed ape mainly inhabiting S.E. Asia. It is without tail, and possesses the power of very rapid movement among the trees of the forests.

Gin, a well-known spirit distilled from malt or barley and flavoured with the juniper berry. The principal varieties are the English and American, known as "Gin" or "Dry Gin", and the Dutch, referred to as "jenever" or "Hollandse jenever". In Germany and Austria it is called "Schnapps". The word "Gin" is an abbreviation of "Geneva", both being primarily derived from the French genièvre (juniper).

Ginger is obtained from a reed-like perennial plant grown in tropical countries. There are two varieties, black ginger and grey ginger. The former is obtained by peeling and drying the root, the latter by scalding and drying. Ginger is largely used as a condiment

Giraffe, the tallest of existing animals, reaching a height of from 18 to 20 ft. when full grown. Its sloping back and elongated neck seem to be the natural evolution of an animal that has to feed on the branches of trees. It is a native of Africa, is of a light fawn colour marked with darker spots, and has a prehensile tongue.

Giralda, a beautiful and remarkable example of Arabian art, erected in 1195 at Seville, still in existence. Minarets similar to the Giralda are to be found at Morocco, Tunis, and Tetuan.

Glaciers form in the higher Alpine ranges, and are immense consolidated masses of snow, which are gradually impelled by their force down the mountain-sides until they reach a point where the temperature causes them to melt, and they run off in streams. From such glaciers the five great rivers, the Rhine, the Po, the Rhône, the Inn, and the Adige, have their source. The longest of the Swiss glaciers is the Gross Aletsch, which sometimes extends over 10 miles. Some of the glaciers of the Himalayas are four times as long. The Muir in Alaska is of enormous magnitude, and that of Justeldals Brae in Norway is the largest in Europe.

Gladiators were professional athletes and combatants in ancient Rome, contesting with each other or with wild beasts. At first they were drawn from the slave and prisoner classes exclusively, but so much were the successful gladiators held in esteem that men came to make a profession of athletics, and gladiatorial training schools were established. When a gladiator was vanquished without being killed in combat, it was left with the spectators to decide his fate, death being voted by holding the hands out with the thumb turned inward, and life by putting forth the hands with the thumb extended. Gladiatorial shows were the chief public displays in Rome from the 3rd to the 4th cent. A.D.

Glass, a substance obtained from the fusion of silica (sand) with various bases, and is more or less transparent. There are numerous kinds of glass, but they group themselves under one or other of the following classifications:—Flint glass, or crystal, whose components are potash, silica, and oxide of lead; window glass, made from soda, lime, and silica; Bohemian glass, containing potash, lime, and silica; and bottle glass, composed of soda, lime, alumina, silica, and oxide of iron. Heat-proof glasses used for making cooking utensils contain boron. Glass was made by the Phoenicians, and was familiar in ancient Egypt. The Egyptians introduced it into Rome. In the Middle Ages Venice was famed for its glass manufactures, but after the 17th cent. Bohemia acquired pre-eminence. English glass reached its highest level of artistic design in the 17th and 18th cent. Window glass was not used in this country for dwellings until the end of the Middle Ages.

Glass-Snake, genus, *Ophisaurus*, of legless lizards with long fragile tails capable of re-generation when broken. Six species are known; in S.E. Europe, S.W. Asia, Indo-China, and N. America. Attains a length of about 2 ft.; main colouring, green, with black and yellow markings.

Glauconite. A green mineral, chemically a hydrated silicate of potassium and iron. Commonly found in marine sands (hence these rocks are known as "greensands") and sandstones.

Glaucus is a curious genus of sea slugs often called the Sea Lizard belonging to the mollusca. It is without shell and has a soft body, with horny mouth and four tentacles. It is a native of the Atlantic, and is not more than 12 in. in length.

Glee, an unaccompanied piece for three or more voices. Glee-singing was popular in England during the 18th and early 19th cent. and glee-clubs are still in existence.

Globigerina, an oceanic unicellular animalcule with a perforated shell, and occurring in certain parts of the Atlantic in such vast numbers as to form a bed of chalk ooze with their empty shells.

Glockenspiel, an instrument composed of metal bars each of which is tuned to a note. The bars are struck by hand-hammers and give forth chiming sounds.

Gloria in Excelsis ("Glory to God in the highest") is the opening of the Latin hymn adapted from Luke ii. 4, and the most prominent hymn of the ecclesiastical rites in the Christian liturgies.

Gloria Patri, the lesser Doxology, with which chants are generally concluded in the English Church service—"Glory be to the Father, and to the Son."

Glow-worm, a beetle, possessing the power (much stronger in the female than the male) of emitting phosphorescent light from the hind end of the body. The female is wingless.

Glucinium. *See* **Beryllium.**

Glucose, Dextrose *or* **Grape Sugar** is a carbohydrate (*q.v.*). It is produced by hydrolysis from cane sugar, dextrine, starch, cellulose, etc., by the action of reagents. It also occurs in many plants, fruits, and honey. For brewing purposes glucose is prepared by the conversion of starch by sulphuric acid. Malt also converts starch into glucose.

Glutton *or* **Wolverine**, the biggest animal of the weasel family, inhabits the northernmost parts of Europe and America. In build it resembles the bear, and is rather larger than a badger. Its fur is of a brown-black hue, but coarse.

Glycerine *or* **Glycerol**, occurs in natural fats combined with fatty acids, and is obtained by decomposing those substances with alkalies or by superheated steam. It is colourless and oily and sweet, and is put to a variety of commercial uses, being widely utilised for medicaments, for lubricating purposes, and in the manufacture of nitro-glycerine.

Glycols. Organic compounds containing two alcohol groups. Ethylene glycol is the most widely known example: it is used as an anti-freeze in motor-car radiators on account of its property of greatly reducing the freezing point of water. Also used in the manufacture of "Terylene". *See* **Esters.**

Glyptodon, an extinct species of gigantic armadillo, fossil remains of which have been discovered in S. America. It was some 9 ft. long, carried a huge tortoise-like shell, and had fluted teeth.

Gneiss, a metamorphic rock usually containing quartz, felspar, and mica. It is banded, the light-coloured minerals being concentrated apart from the dark minerals.

Gnosticism. *See* **J18.**

Gnu, an animal of the antelope family, combining the characteristics of the buffalo in its head and horns, the ass in its neck and mane, and the horse in its long and bushy tail. There are two species, the common and the brindled, and they are about the size of an ass. They abound in Africa and congregate in herds.

Goat-Moth (*Cossus cossus*), a large moth of the *Cossidae* family, common in Britain, evil-smelling, and very destructive in the larval stage to trees of the poplar and willow genus, into the wood of which the caterpillar bores during its three years' period of development.

Goats are horned ruminant quadrupeds, indigenous to the Eastern Hemisphere, but now domesticated in all parts of the world. Though related to the sheep, they are a much hardier and more active animal. The male has a tuft of hair under the chin. Many species, including those of Cashmere and Angora, are valuable for their hair, which is used for fine textile fabrics. The milk of the goat is nutritive, and goat-skins are in good demand for leather for gloves, shoes, etc.

Gobelin Tapestry was originated by a family of dyers named Gobelin in the 15th cent. in Paris. The Gobelin establishment, which produced this beautiful tapestry, made of silk and wool, or silk and cotton, was taken over by the Government of Louis XIV., in 1662, and since then has been the French national factory for that class of fabric.

God and Man. *See* **J18.**

Gog and Magog, two legendary City of London giants, supposed to be the offspring of certain wicked daughters of the Emperor Diocletian and a band of demons. They were brought captive to London and made to serve as prisoners at the Palace of Brute, which stood on the site of Guildhall. Effigies of the giants have stood in Guildhall since the time of Henry V. They were destroyed in the Great Fire of 1666, replaced in 1672, and used to be carried through the streets of London in the Lord Mayor's Show. The present figures, newly carved in lime wood by Mr. David Evans, replaced those carved in 1708 by Richard Saunders, which were destroyed in an air raid during the last war.

Gold. Metallic element, symbol Au (Latin *Aurum*) related to silver and copper, the coinage metals. The greatest amount of gold is obtained by treating gold-bearing quartz by the cyanide process. The gold is dissolved out by cyanide solution, which is then run into long boxes filled with zinc shavings when the gold is precipitated as a black slime. This is melted with an oxidising agent which removes the zinc.

Gold-Beaters' Skin is the outside membrane of the large intestine of the ox, specially prepared and used by gold-beaters for placing between the leaves of gold while they beat them. This membrane is of great tenacity, and gets beaten to such extreme thinness that it is used to put on cuts and bruises.

Gold Standard. Under the gold-standard system, which was widely prevalent up to 1914, each gold-standard country fixed the value of its currency in terms of a weight of gold of a certain fineness and was, broadly speaking, ready to exchange its currency freely for gold, which could then be exported without restriction. This involved keeping a gold reserve big enough to meet all likely demands and also to serve as a backing for the issue of notes. The gold standard had to be given up during the First World War; and though it was in substance restored in Great Britain in 1925 (when Churchill was Chancellor), the restoration was never complete, as the gold reserve remained too small for complete freedom to export to be practicable. Sterling had to be devalued in the financial crisis of 1931 (which brought about the fall of the Labour Government) and Great Britain was forced off the gold standard. Most of the currencies important in world trade and payments are now convertible. The monetary crisis of March 1968 led to the present two-tier gold price system. *See* **Section G, Part III.**

Goldeneye, a species of wild duck, widely distributed over Arctic regions. It is a passage-migrant and winter-visitor to the British Isles. Has nested in Cheshire. Distinguished by a large white spot in front of each eye on a dark ground.

Golden Number, the number of any year in the metonic cycle of 19 years, deriving its name from the fact that in the old calendars it was always printed in gold. It is found by adding 1 to the number of the year A.D. and dividing by 19, the remainder being the Golden Number; or, if no remainder, the Golden Number is 19. The only use to which the Golden Number is put now is in making ecclesiastical calculations for determining movable feasts.

Goldsmiths Company, one of the richest London City Companies; the official assayers of gold and silver, invested with the power of "hall-marking" the quality of objects made from these metals. First charter granted in 1327.

Gondola, the old regulation black boats so common on the canals of Venice, propelled by a gondolier with one oar who stands at the stern, his passengers being accommodated in a covered space in the centre.

Gonfalon, the pennon affixed to a lance, spear, or standard, consisting usually of two or three streamers, and made to turn like a weather-cock.

Gophers. Rodent mammals. The pocket gophers are stout-bodied burrowers common in the U.S.A. The slender burrowing gophers, also called "ground squirrels," occur in central and western U.S.A. The sisel or suslik is a related European species. They are a great pest among grain crops.

Gordon Riots of 1780 were an anti-popery agitation fomented by Lord George Gordon. Called also "No-Popery Riots."

Gorilla, the largest of the anthropoid apes, found in the forests of Equatorial Africa, and at maturity standing from 4 to 5 ft. high.

Goshawk (*Accipter gentilis*), a diurnal bird of prey,

fearless and extremely agile; loves wooded country and is very destructive of poultry and game-birds. It resembles the peregrine falcon in appearance, but has shorter, rounded wings. This bird was a great favourite of falconers in mediaeval times.

Gospels are those portions of the New Testament which deal with the life, death, resurrection, and teachings of Christ. They are the gospels of Matthew, Mark, Luke, and John, and the first three are called the *synoptic gospels* because of their general unity of narrative. That of John is of somewhat wider scope, and gives in addition to the story of the Passion an account of the ministry in Judaea.

Gothic. A term applied to a style of architecture which followed the Romanesque, appeared in France during the 12th cent., and is typical of northern Europe. It was not generally appreciated south of the Alps. The high and sharply pointed arches, the walls supported outside by flying buttresses, the traceried windows, often filled with stained glass, and the lofty spires are in sharp distinction to the semicircular arches and the massive walls characteristic of the more sturdy Romanesque style. Yet the transition was gradual. The cathedrals of Chartres, Laon, and the Benedictine church of St. Denis just outside Paris are typical of early Gothic. The style found its full expression in the French cathedrals of the 13th and 14th cent.: Reims, Notre Dame, Beauvais, Bourges, and Amiens. From France the style spread to other lands in each of which it developed its own characteristics; thus the English churches tended to have massive towers and delicate spires and, as at Salisbury, were often set in open grounds surrounded by lawns; Flemish and Dutch churches were sometimes built of brick as were those in north Germany and Scandinavia; in Spain the Flamboyant style was followed. The main Gothic cathedral in Italy, that of Milan, although begun in 1386 was not completed until the early 19th cent. The lofty character of Gothic has been attributed by the romantic to pious aspiration, as if the spires were striving towards heaven and this concept may well have played a part. The more concrete reasons however were somewhat different: Romanesque churches were thick-walled, sturdy, small-windowed, and set often in open country or on heights (*a*) because architects had not yet discovered how to support a heavy roof without massive walls; and (*b*) because, being built in dangerous times, they had a defensive function. Gothic churches began to be raised in less troublesome times and were tall for the same reason that New York skyscrapers are tall (*i.e.*, the increasing price of land). Also they were built in growing cities where not much space was available and they were lavish in style because wealth was increasing and rich merchants were willing to contribute. Late English Gothic is seen, for example, at King's College Chapel, Cambridge, Henry's Chapel at Westminister, and St. George's Chapel at Windsor (all *c.* 1500). Gothic is also found in secular buildings, *e.g.*, Little Wenham Hall in Suffolk, the castle at Ghent, the town halls of Louvain and Middelburg, and the streets of Gothic houses in Bruges still in use today. Virtually Gothic as a style (excluding the "Gothic revival" of 19th cent. England) ended at the close of the 15th cent. Gothic art is best seen in the illuminated manuscripts of the 13th and 14th cent. and in the church sculpture. Its characteristic is a complete departure from the cool, perfectionist realism of classical times with distortion to produce emotional effects. The human figures are not ideal forms but recognisable as people we might meet in the street; yet there was also the element of wild imagination, intricate design, and a wealth of feeling which might be grotesque, humorous, macabre, or even obscene. This element of distortion and sometimes wildly "unrealistic" colouring which produced an effect more dramatic than the literal representation of the classic schools remained an important element in German art (*see* Expressionism) right up to modern times and is used by other modern schools.

Goths. A Teutonic people who originally came from southern Sweden (Gotland) and by the 3rd cent. were settled in the region north of the Black Sea. They began to encroach on the Roman Empire and early in the 4th cent. split into two divisions: the "wise" Goths or Visigoths between the Danube and the Dniester (referred to as the West Goths), and the "bright" Goths or Ostrogoths in southern Russia on the Dnieper (referred to as the East Goths). The Ostrogoths were conquered by the Huns *c.* 370, while the Visigoths under Alaric devastated Greece and sacked Rome in 410. Eventually the Visigoths spread to France and Spain and their last king Roderick fell in battle against the Moors in 711. The Ostrogoths regained their independence on the death of Attila in 453 and under their king Theodoric the Great conquered Italy in 493. They lost their identity after Justinian regained Italy, 525–552.

Gourd Family *or* **Cucurbitaceae.** This family of about 650 species of flowering plants includes the gourds, pumpkins, cantaloupes, cucumber, gherkin, water-melon and squashes. Most abundant in the tropics, the cucurbits are mainly climbing annuals with very rapid growth. The bath-room loofah is the skeleton of one curcurbit fruit, *Luffa cylindrica*. The squirting cucumber is another member of the family.

Governor. A device attached to an engine, turbine, compressor, etc., which automatically controls the engine's speed in accordance with power demand. Most governors depend upon the centrifugal action of two or more balls which are thrown outwards as their speed of rotation increases and actuate a throttle valve or cut-off. The centrifugal governor was invented by Thomas Mead, patented by him in 1787, and used on windmills. Watt adapted it to the steam engine.

Grail, Legend of the Holy, a tale of Celtic origin which became part of Arthurian legend and the subject of many mediaeval quest-romances. According to the Christian version the grail was the cup which Christ used at the Last Supper, brought to England by St. Joseph of Arimathea.

Grand Prix, the "French Derby," was established by Napoleon III., in 1863. It is the chief French race and is an international competition of three-year-olds.

Granite is a coarsely crystalline igneous rock consisting of quartz and alkali felspars plus mica or hornblende. It is a much used ornamental and building stone; it forms the high ground of Dartmoor and Bodmin Moor.

Graphite *or* **Plumbago,** commonly called black-lead, is a form of carbon occurring in foliated masses in marble, schist, etc. It is soft, will make black marks on paper or other plain surfaces, and is mainly used for lead pencils. It is also a valuable lubricant. Pure graphite has found a new use with the construction of atomic piles. Important deposits occur in Siberia, Ceylon, Madagascar, Canada, and the U.S.A.

Graptolites, fossil animals confined to Cambrian, Ordovician and Silurian strata. Once classified as hydrazoa but now considered more likely to be hemichordates.

Grasshopper. There are many species of these leaping insects which are related to the locusts and crickets. Most are vegetarians; some eat flies and caterpillars also. The chirping sound they make is made by scraping the hind legs against the wings; in some species a noise is produced by rubbing the wings together.

Gravitation. One of the four types of force known to physics. The others are electromagnetic forces and two types of nuclear force (F15(2)). Gravitational forces are an attraction that one piece of matter has for another; they dominate astronomical phenomena, but inside the atom they are negligible compared with the other three types of force. Einstein's General Theory of Relativity is the only theory at present extant which attempts to interpret gravitational forces in terms of more fundamental concepts. *See* F15(1).

Graylag, the ordinary wild grey goose of Europe, the species from which domestic geese are derived; frequents fens and marshes; breeds in Iceland, Scandinavia, and Scotland; distinguished by pinkish legs and feet and lack of black markings on bill.

Grayling, a fresh-water fish of the salmon family

having a large dorsal fin, and averaging about 1 lb. in weight.

Grebe, a diving bird of beautiful plumage found over a great part of the world on lakes and oceans. The two species familiar in Great Britain are the Dabchick or Little Grebe and the large and handsome Great Crested Grebe, which has a feathery tuft, lost in the autumn, on each side of the head. Grebes have remarkable courtship displays. The breast feathers are of a downy softness and silver lustre, for which they were formerly much hunted.

Greek Art. *See* Hellenic Art.

Greek Fire, a combustible, supposed to have been composed of sulphur, nitre, naphtha, and asphalt, used with destructive effect by the Greeks of the Eastern Empire in their wars.

Greek Kalends, equivalent to never, as only the Romans, not the Greeks, had kalends.

Greenwich Mean Time. The first Nautical Almanac, for the use of navigators and astronomers, was published by the Astronomer Royal in 1767. It was based on the meridian at Greenwich, with longitude measured east and west of 0°. A master clock, which still exists, was built at Greenwich Observatory in 1852 to control the railway station clocks and Greenwich Mean Time, or Railway Time as it was sometimes called, prevailed. In 1884 Greenwich was chosen as the prime meridian of the world and GMT became known as Universal Time. Continuously from Feb. 18, 1968, clocks in Britain are one hour fast on GMT but GMT remains as the standard time by which the time zones of the world are calculated. *See* British Standard Time.

Gregorian Calendar. *See* Calendar.

Gregorian Chant, ritual music with a system of harmony suitable for church use. First established by Pope Gregory I.

Gresham's Law states that if good money, *i.e.*, money with the higher intrinsic value, and bad money are in circulation together, the bad money will tend to drive out the good money from circulation. For instance, the good money is more likely to be melted down or demanded in payment by foreign creditors.

Gretna Green, a celebrated village in Dumfries, just over the border from England, where runaway marriages were performed from 1754 to 1856, though only completely stopped during present century.

Griffin, in ancient mythology, a winged creature with an eagle's head and body of a lion, found in ancient sculptures of Persia and Assyria. Its origin is traced to the Hittites. It had the same religious significance as the winged sphinx of Egypt. The griffin vulture is a bird named after the mythological creature, found in Europe, Africa and India.

Grilse, a young salmon that has only been once to the sea.

Grimm's Law, formulated by Jacob Grimm, an eminent German philologist, lays down a principle of consonantal change in the Germanic languages. For instance, Lat. *pater*, Eng. *father*, Ger. *Vater*; Lat. *frater*, Eng. *brother*, Ger. *Bruder*; Lat. *decem*, Eng. *ten*, Ger. *zehn*.

Grog, the beverage served out to sailors, and compounded of spirit and water in prescribed proportions. The name, it is said, was derived from the fact that Admiral Vernon, who introduced it into the English navy in 1745, wore Grogram breeches.

Grogram (French = *gros grain*), a kind of rough fabric made of wool and some other fibre, such as silk, mohair, or cotton, formerly much used for commoner kinds of wearing apparel.

Grotto, a natural or artificial cave. Among the most famous are the blue grotto of Capri and the stalactite grotto of Antiparos (Cyclades, Aegean). The latter has been known since 1673 and is of singular picturesqueness.

Ground Wave, that part of the energy emitted by a radio transmitter which travels along the ground; as opposed to the sky wave which is reflected back to earth by the ionosphere. With the lower radio-frequencies, the ground wave can be picked up over several thousand miles; in the broadcasting band, over a hundred or so miles; it is virtually useless at high frequencies.

Grouse, game bird of the northern latitudes where some 20 species occur. They are stout, compact, ground-dwelling birds, protectively plumaged (the willow grouse turns white in winter), the male usually being larger and more brightly coloured than the female. The red grouse of the British moorlands has been introduced into Belgium and W. Germany. Of the same family are the blackcock, ptarmigan, capercaillie, American prairie-hen, and the common partridge. Grouse shooting begins in Britain on Aug. 12.

Guanaco, a large species of llama, common to South America, and utilised as a beast of burden.

Guano, the excrement of sea-birds, found in large quantities on the rocky islands of the western coasts of South America and Nauru Is. It forms a useful fertilising agent, being rich in phosphate and ammonia, and first came into use in 1841, since which time Peruvian guano has been a recognised article of commerce. Beds of guano from 50 to 60 ft. in thickness are not uncommon. Fish guano and bat guano from caves in South America and the Bahamas are also used as fertilisers.

Gudgeon, a small fresh-water fish of the carp family with 2 small barbels on the upper lip.

Guelph and Ghibelline, italianised forms of the German words "Welf" and "Waiblingen," the names of two rival princely families whose conflicts made much of the history of Germany and Italy during the Middle Ages. The feuds between these two factions continued in Italy during the campaigns of Emperor Frederick I., and later developed into the fierce struggles of the 13th cent. between emperor and pope. In Italy the Ghibellines supported the side of the German emperors and the Guelphs the cause of the pope. The present Royal Family of England is descended from the Guelphs, through the ducal House of Brunswick (the name of Windsor was assumed during the first world war).

Guildhall, the place of assembly of the members of a guild, and at one time, when guilds were in full strength, was practically the Town Hall. The London Guildhall is to-day the hall of meeting for the City of London Corporation.

Guilds for the fostering and protection of various trades have existed in England since Anglo-Saxon times, and from the 12th to the 16th cent. exercised great influence and enjoyed many privileges. There were trades' guilds and craftsmen's guilds, and in all large cities and towns there was a guild hall. Their successes in the Middle Ages led to many monopolistic abuses, and in the end it became necessary to free the country from their restrictive power. The City Guilds (Livery Companies of the City of London) derive their name from the distinctive dress assumed by their members in the 14th cent. There are 83 Guilds in existence.

Guild Socialism. *See* J21.

Guillemot, a genus of sea-birds of the auk family, common in Northern Europe, two species—the Common Guillemot and the Black Guillemot—being natives of our own sea coasts, nesting on the cliffs. Brünnich's Guillemot, an Arctic species, is a rare straggler in the British Isles.

Guinea, an English gold coin of the value of twenty-one shillings, current from 1663 to 1817, and deriving its name from the first guinea coinage having been struck from gold obtained on the coast of Guinea.

Guinea-Pig, a rodent of the cavy family about 10 in. in length and with a tail so short that it does not project outside the body. It makes an excellent pet, though easily frightened. Its ancestors were species of the wild cavy of S. America said to have been domesticated by the Incas of Peru. *See* Z15(2).

Gules, a heraldic term, denoting a rose of red tincture, indicated by vertical lines drawn or engraved without colour.

Gulf Stream is confined entirely to the western side of the N. Atlantic and is the warm-water current flowing through the Straits of Florida from the Gulf of Mexico parallel to the American coast up as far as Cape Hatteras. From there it continues north-eastwards as a slower, broader, cooler (yet even so, relatively warm) drift of water, merging with the North Atlantic Drift and losing its identity about 40° N. Lat., 60° W. Long. It is a common error to attribute the

warmth of the British Isles and Western Europe generally to the Gulf Stream but this has no influence whatever except in so far as it feeds the North Atlantic Drift. Both the Gulf Stream and the North Atlantic Drift owe their movement to the direction of the prevailing winds, and it is the south-westerly airstream coming from warmer regions and passing over the surface waters of the Atlantic Drift that brings the warmth inland to influence the climate of Western Europe.

Gull. An extremely well-known, long-winged sea-bird with rather short legs and webbed feet. In almost all adults the body and tail are white whilst the back and most of the wings are grey or black. In the majority of cases the plumage of juveniles is partly or entirely dusky. Gulls are omnivorous, and are very useful as scavengers. They follow ships and quickly seize upon any refuse which may be thrown overboard. There are 44 species, which vary in size from moderately small to large. With certain exceptions, such as the Kittiwake in the North Atlantic, they are not found very far from land. They are sociable and mostly breed in colonies on cliff-ledges, on islands, beaches and sandhills, and among vegetation in swamps, sometimes a long way from the sea. The nest is usually substantial, and the eggs generally number from two to three. Of the 29 species breeding in the northern hemisphere, 14 occur in the British Isles. The pure white Ivory Gull is the most northerly of birds. Sabine's and the Swallow-tailed Gull have forked tails. Ross's Gull has a black ring round the neck and one species, Franklin's Gull, migrates from the North, where it breeds, to pass the winter in the Southern hemisphere.

Gums are glutinous compounds obtained from vegetable sources, soluble in cold or hot water, but not in alcohol. There are innumerable varieties. Gum Arabic is exuded from a species of acacia grown in Senegal, the Sudan, Arabia, India and other countries, and is a valuable commercial product, used in dyeing, ink-making, as a mucilage, and in medicine. India-rubber is an elastic gum. Gums are also made from starch, potatoes, wheat, etc., from seeds, bark, roots, and weeds. Many so-called gums are resins.

Gun-Cotton, a powerful explosive manufactured by subjecting a prepared cotton to the prolonged action of a mixture of three parts sulphuric acid and one part of nitric acid. It burns without explosion on ignition, but by percussion explodes with a force five times greater than that of gunpowder.

Gunpowder, also called "black powder," the oldest of explosive mixtures, consists of saltpetre, sulphur, and charcoal, intimately mixed, the proportions being varied for different intended uses.

Gunpowder Plot was a conspiracy by a desperate band of Roman Catholics in the reign of James I. to avenge the harsh treatment to which Catholics were subjected. Barrels of gunpowder were secreted in the vaults underneath the Houses of Parliament, and it was proposed to fire these when the King and his Ministers assembled on Nov. 5, 1605. The plot was betrayed and Guy Fawkes and his co-conspirators were arrested and executed. The date serves to perpetuate the ancient custom of burning the effigy of Fawkes, a custom in which young people are the most enthusiastic participants, with bonfires, fireworks, etc.

Gunter's Chain, a surveyor's chain, 22 yd. long divided into 100 links, invented by Edmund Gunter (1581–1626), Professor of Astronomy at Gresham College, for the measurement of areas. 1 acre contains 100,000 square links.

Gurnard, a sea-fish, with large, bony head and diminutive body, of which there are some forty species. They are plentiful in British waters.

Gymnasium, originally the name given in ancient Greece to the public places where Greek youth used to exercise and receive instruction. Plato, Aristotle, and other great teachers lectured there. The Greek institution was never very popular with the Romans, and it was not until the 18th and 19th cent. that the cult of combining physical with intellectual activity again found a place in educational systems. In Germany the name was applied to the classical grammar school; in this country and America to the halls where gymnastics were practised.

Gypsies, a nomadic race, believed to be of Indian origin; their language, Romany, is related to the languages of N.W. India. They are spread over many parts of the world, but are most common in Europe, having appeared in Western Europe in 1417, finding their way to England at the beginning of the 16th cent. They give evidence of their Eastern origin in their dark skins, large black eyes, black hair, and pearly white teeth. They are born wanderers, but it is becoming increasingly difficult for them to find sites, and local authorities are being urged to help. Economic pressure has largely removed their traditional crafts of tinkering, basket-making, peg-making. The majority now deal in scrap-iron, paper, and rags. Estimated population (1967) in England and Wales: 15,000.

Gypsum, a whitish mineral consisting of hydrated sulphate of calcium. The finest gypsum is alabaster. When heated gypsum is converted into the powder called Plaster of Paris; the water it loses can be taken up when the plaster is wetted, and the reconversion of Plaster of Paris into gypsum accounts for the way in which the former sets hard. The name "Plaster of Paris" came from the location of important gypsum quarries in the Montmartre district of Paris. It was found after the flood disasters of Jan. 1953 that gypsum could undo the effect of sea-water. By spreading it for the rain to wash into the soil, thousands of acres of farmland in Holland and Britain were made productive again.

Gyroscope is a symmetrical rapidly rotating object, typically wheel-like, which because of its mass and rotation possesses a lot of the dynamical property known as angular momentum. Basic dynamical laws tell us that angular momentum is conserved and a consequence of this is that the axis of rotation tends to stay pointing in the same direction. Disturbing influences make a gyroscope's motion complicated but the general effect of the presence of a gyroscope attached to any body is to help to stabilise the body's motion. This is made use of in reducing the rocking of ships and in compasses and control systems in aircraft, torpedoes, and missiles.

H

Habeas Corpus, the name given to a writ ordering the body of a person under restraint or imprisonment to be brought into court for full inquiry into the legality of the restraint to be made. The first Habeas Corpus Act was passed in 1679, though nominally such a right had existed from Magna Carta, but some of the more despotic kings had disregarded it. In times of public peril the privilege of *habeas corpus* is sometimes temporarily suspended, many instances occurring in the history of Ireland and during the First and Second World Wars.

Haber Process, the important industrial process for synthesising ammonia from atmospheric nitrogen. Nitrogen and hydrogen are made to combine at high pressure (200 atmospheres or upwards) in an electric arc.

Haddock, one of the best-known fishes abounding in northern seas and averaging about 4 lb. in weight. Related to the cod. Largely used for curing, and sold as "finnan haddies."

Hade of veins, a mining term indicating the particular inclination that any vein, seam, or strata may have from the perpendicular; thus, in Weardale the veins mainly "hade" to the north.

Hadrian's Wall. *See* **Roman Walls.**

Haematite, ferric oxide, one of the principal iron ores, containing about 70% of the metal. It is usually found in kidney-shaped masses, and is specular, red or brown, in thin fragments, but greyish in bulk.

Haemocyanin, the respiratory pigment of crustaceans and molluscs. It functions like haemoglobin, from which it differs in containing copper instead of iron and being blue when oxidised instead of red. *See* **F29 (2).**

Haemoglobin, the pigment containing iron which gives red blood corpuscles their colour. It is a

respiratory pigment, having the property of picking up oxygen when the blood passes through the lungs to produce the compound known as oxyhaemoglobin. In other parts of the body the oxyhaemoglobin breaks down, liberating oxygen, which is used in the oxidation process (respiration) that the body tissues carry on. *See* F29(2).

Hafiz, besides being the pseudonym of a famous Persian poet, is a title conferred upon any Mohammedan who has committed the whole of the Koran to memory.

Hafnium, a metallic element discovered by Coster and Hevesy in 1922 and important in the atomic-energy field. It occurs in most zirconium minerals to the extent of about 5 per cent.

Hag-fish, a blind, eel-like parasitic sea-fish with soft backbone; found within the bodies of other fish, and called sometimes the "borer," or "the glutinous hag-fish." Related to the Lamprey.

Hagiarchy, the rule or order of Saints.

Hagiology, a branch of literature that is wholly given up to the history of the saints, and the setting forth of the stories and legends associated with their names.

Hail, hard, roughly spherical balls of ice, consisting of white cores covered by layers of both transparent and opaque ice, frequently falling during thunderstorms. They usually do not exceed 1 in. in size, but hailstones larger than apples and weighing more than 2 lb. have been observed. The general theory of a hailstone is that near the top of a cumulonimbus cloud a raindrop becomes frozen, grows in size by condensation and through collisions with snow particles, and eventually becomes so weighty as to overcome the ascending air currents in the cloud. Falling, it first encounters supercooled water drops, immediately freezing on it, increasing the white core, and then at lower levels ordinary water drops, freezing more slowly, producing a layer of clear ice. Before the hailstone arrives at the ground gusts and lulls may transport it several times up and down both regions, adding alternate coatings of soft white and hard clear ice.

Hake, a fish of the cod family, found in large numbers in the seas of Europe, but not in high favour for the table with fastidious feeders.

Halcyon, a term associated in olden times with the kingfisher and days of soothing calm, "halcyon days" being a frequently used expression. The legend was that the kingfisher laid its eggs on the surface of the sea at the time of the winter solstice when the sea was unruffled. Halcyon is the Greek for kingfisher.

Halibut, one of the largest of the flat fishes, averaging when full grown from 4 to 6 ft. in length, and highly esteemed for the table. Specimens of still larger size occasionally occur. It is plentifully distributed. Its two eyes are on the right side of the head.

Hall-mark. A mark or group of marks, impressed by an assay office on gold or silver articles guaranteeing the standard of fineness of the precious metal used in them. These marks, which have been applied to silver made in London since the beginning of the 14th cent. and perhaps earlier, make it possible to establish the year and place of assay as also the name of the maker. English pieces of silver usually have not less than four marks, viz., (1) town mark; (2) maker's mark; (3) date letter; (4) sterling mark.

The town mark is rarely changed; in London a crowned leopard's head was used from the earliest days until 1820 with only minor modifications, except for the period 1697–1720 when a lion's head erased was substituted; since 1820 the crown has been omitted.

Until the late 17th cent. a symbol was often used as a maker's mark, from 1696 to 1720 the first two letters of the maker's surname, and subsequently the maker's initials. Owing to the destruction of the earlier mark plates at Goldsmiths' Hall no maker's name prior to the late 17th cent. can be identified with certainty.

The London date letter is changed at the end of May each year, so each letter covers seven months of one year and five months of the following. The London date cycle has usually consisted of twenty letters: the alphabet of each cycle is of different style, and the letters are enclosed in shields of different shape.

The sterling mark, the lion passant, was introduced in 1544 and continued in use until 1697, when the higher Britannia standard was introduced in order to discourage the practice current amongst goldsmiths of melting down coin of the realm to make plate. The leopard's head crowned and the lion passant were then replaced by a figure of Britannia and a lion's head erased. Though the regulation imposing the higher standard was withdrawn in 1720, a small amount of Britannia standard silver continued to be made and still is made.

From 1784 until 1890 a plate tax was levied on all silver assayed in Great Britain and an additional duty mark, the sovereign's head, was used during this period. A Jubilee mark bearing the head of George V and of Queen Mary was used in between the years 1933 and 1935, and in 1953 a coronation mark with the head of Queen Elizabeth was introduced.

The tables of hall-marks in Gen. Comp. (N16–18) give the London date letter cycles from 1598 to 1955. The form of town mark and sterling mark used during each cycle is given at the head of each column. Where a major alteration took place in either of these marks during a date-letter cycle, the alternative forms are also shown. The date of the change can be established by reference to the notes above. At the bottom of each page the marks used by the major provincial, Scottish and Irish assay offices are shown. Owing to lack of space, the complete date-letter cycles are not shown, but two examples only from the 17th, 18th or 19th cent. Where a provincial assay office was established in the 17th cent. or earlier, the marks of one year in the 17th and 18th cent. respectively are shown, where the office was not established until the 18th cent., the marks of one year in the 18th and 19th cent. are given.

Halloween (Oct. 31), the eve of All Saints' Day, a time associated, especially in Scotland, with certain pleasing superstitions attractively set forth in Burns's famous poem "Hallowe'en." It is the night when young men and maidens are supposed, by observing certain rites, to have their future wives and husbands disclosed to them.

Hallucinogen, a drug which acts upon the brain to create sensory illusions or hallucinations with a variety of emotional effects. One of the most widely studied is LSD (*q.v.*) which will produce symptoms very similar to those found in some mental disorders. *See* Section P, Part III.

Halo, a luminous circle usually of 22° radius, surrounding sun or moon, produced by the refraction and reflection of light by ice crystals of high cirrus cloud. It is a very common occurrence, in the British Isles almost one day in three. The inner side is red and the outer a whitish-yellow colour. "Mock suns," *i.e.*, patches of light at the same elevation as the sun are much rarer occurrences, sometimes being of great beauty and brilliance. Halo is the Greek for threshing-floor. *See* Coronae.

Halogens, the group name for the four nonmetallic elements fluorine, chlorine, bromine, and iodine. The term "halogen" means "salt-producer."

Halteres, the modified hind-wings of the two-winged flies or *Diptera* (*e.g.*, the house-fly). The equilibrium in flight of these insects depends on the halteres, which are commonly called "balancers."

Hampton Court Conference, presided over at Hampton Court Palace by James I. in 1604 and which brought about his authorised translation of the Bible, had an important bearing on the religious differences of the time. James refused to grant tolerations to the Puritans. This sowed the seeds of civil war. Following the conference three hundred English Puritan clergy were ejected from their livings.

Hanaper Office, a former Chancery office, deriving its name from the fact that its writs and papers were kept in a hanaper (hamper). The Chancellor's officer thus came to be known as the Hanaper. The Comptrollers of the Hanaper were abolished in England in 1842.

Hand, a measure of four inches, the average size of the palm; used in reckoning height of horses.

Handfasting, an informal marriage custom once prevalent in Scotland, whereby a man and woman bound themselves to cohabit for a year and a day, and at the end of that period either confirmed their contract by a regular marriage or separated.

Hansard, the title given to the official reports of Parliamentary debates, so named after Luke Hansard who in 1774 became partner in a firm of printers to the House of Commons. His son T. C. Hansard was first the printer and then the publisher of an unofficial series of parliamentary debates inaugurated by William Cobbett in 1803. In 1909 production was taken over by H.M. Stationery Office and today's volumes contain full, substantially verbatim, reports of what is said in both Houses of Parliament.

Hanseatic League was a confederation of North German towns established about 1241 for purposes of mutual protection in carrying on international commerce. The League became so powerful that it was able to dominate the foreign trade of Norway, Sweden, Denmark, and even to some extent of London. A branch was established in London and had its guild hall in Cannon Street for hundreds of years. The League existed down to the middle of the 17th cent. Hamburg, Lübeck, and Bremen are the only cities which, as free ports, still by commercial courtesy retain the name of Hanse towns. *Hansa* is Old High German for Association or Merchants' Guild.

Hansom, a two-wheeled one-horse cab, invented by Joseph A. Hansom in 1843. It was, until the introduction of the taxi, the cab in most ordinary use in London and other large cities. Lord Beaconsfield styled it the "gondola of London." The driver sat on a "dickey" behind, level with the roof of the cab.

Hara-kiri, the custom of suicide by compulsion, or "happy despatch," once common in Japan, but no longer permitted. The condemned person gave himself the first cut, and if his courage then failed him, the fatal blow was dealt by a friend.

Hard Water. Water containing appreciable quantities of dissolved salts of calcium and magnesium. It is difficult to form a lather with soap in hard water, and the impurities block up water pipes. *See* Water.

Hare, species of the *Lepus genus*, distributed widely through the N. hemisphere. Noted for having four upper front teeth, one pair behind the other, short tufted tail, a cleft upper lip and longer ears and limbs than the rabbit. It does not burrow. The young are born with hair and able to see. A swift animal hunted with greyhounds in the sport called "coursing." *See* Game.

Harleian MSS. comprise some thousands of volumes of MSS. and documents, collected by the first Earl of Oxford (1661–1724) and his son Edward. After the death of the latter, his widow handed the MSS. over to the nation for £10,000, a sum that did not represent a quarter of their value, and they are deposited in the British Museum.

Harlequin, the buffoon of ancient Italian comedy. As adapted to the British stage, however, harlequin is a pantomime character only, in love with Columbine, appearing in parti-coloured garments and carrying a wand, by which he exercises a magic influence in thwarting the fantastic tricks of the clown and pantaloon.

Harmattan, a dry wind which may blow between January and May across the Sahara to the Gulf of Guinea. Although affording relief from the tropical heat, vegetation withers because of its extreme dryness and much irritation is caused by the clouds of fine dust which it carries.

Harmonic Motion, regular periodic motion of the kind exemplified by a ball bobbing up and down at the end of a spring, and by the piston in a steam engine. It may be simple (simple harmonic motion) or composed of two or more simple harmonic motions. In simple harmonic motion the acceleration is proportional to the distance of the moving body from its original rest position.

Harp-seal, the ordinary Greenland seal, with a dark harp-shaped marking on its back, hence its name. It abounds in Newfoundland waters and further northward towards the Arctic.

Harpy Eagle, a large bird of prey named from the winged monsters of Greek mythology, inhabiting the forest regions of Central and South America. There are eight species, one with handsome grey plumage and large crest which attacks and kills animals much larger than itself, and was called by the Aztecs "winged wolf."

Harrier, a bird of prey of the falcon family; of the various species distributed over the world, three breed in Britain: the moorland Hen harrier, the Marsh harrier, and Montagu's harrier. They are large birds with long tails, long legs, long wings, and gliding flight. They nest on the ground and eat small mammals, frogs, lizards, and small birds.

Hartebeest, common African antelope of a grey-brown colour, with ringed and knotted horns bending backward and tapering to sharp points; gregarious, of large size, and capable of domestication. There are several species.

Harvest Bug, a very small insect, of a dark red colour, which appears in large numbers in the fields in autumn, and is peculiarly irritating to animals and man by the tenacity with which it attaches itself to the skin and burrows underneath. Probably the larvae of spinning mites (Trombidoids). In the U.S.A. they are called "chiggers."

Harvest Moon, the full moon that occurs nearest to the autumn equinox, in September. It rises for several nights running about the same time, and yields an unusually brilliant series of moonlight nights.

Harvestmen are, like spiders, members of the arachnid class but belong to the distinctly different order of Phalangida. They are common in the countryside in autumn and have small oval bodies and eight long slender legs which besides being mere organs of locomotion also act as sense organs. Known as "daddy longlegs" in America.

Hashish, an Arabic word for the narcotic substance prepared from the hemp plant (*Cannabis sativa*). It is known by a variety of names, *e.g.*, bhang in India and marijuana in America.

Hatchment, in heraldry, is a square board, in vertical diagonal position, placed outside a house or on the tomb at the death of a member of a family and so arranged that it indicates the sex and condition of the deceased.

Hawfinch, a well-known European bird of the finch family, having a variegated plumage, a sturdy bill, and black-and-white tail. In England it is found in the Midland and Eastern Counties, and locally in Scotland.

Hawk. This name is applied to almost any diurnal bird of prey other than eagle, falcon, or vulture, but in its strict sense applies only to the *Accipiter* genus—the small Sparrow Hawk and the larger Goshawk, round-winged, long-tailed birds with barred under-parts. They prey upon small birds captured in flight and small mammals.

Hawk-moths, large species of moths, thick of body and strong of wing, which fly with rapid swooping motion, hence its name. There are numerous handsome species in Britain.

Hearth-Money was a tax laid on hearths (in all houses paying the church and poor rates). Charles II. introduced it in 1662, and it was repealed in the reign of William and Mary.

Heat, after prolonged controversy over whether or not heat is a "substance" (formerly called "caloric"), it was established in the 19th cent. that heat is a form of energy; it is in fact the combined kinetic and potential energy of the atoms of which a body is composed. Heat can be turned into other forms of energy, *e.g.*, a red hot body loses heat by radiating it in the form of electromagnetic waves ("radiant heat"—chiefly infra-red rays). Heat may also be transferred from one place to another by conduction and, in fluids, by convection. All three processes occur when a glowing fire heats a room. A unit quantity of heat is the calorie, which is the amount of heat sufficient to raise the temperature of 1 gm. of water by 1° C. In general, adding heat to a body raises its temperature. The number of calories required per gm. of material to raise the temperature 1° C. is called the *specific heat* of the material. However, adding heat may not raise the temperature but may instead cause a change of state, *e.g.* from solid to liquid (melting) or liquid to gas (evaporation). The amount of heat required to

melt 1 gm. of a solid is called the latent heat of melting. Similarly, there is a latent heat of evaporation. Strictly speaking, the specific and latent heats of a substance depend on how much its pressure and volume are allowed to vary during the measurements. Water has a high specific heat, and this makes the oceans a vast heat reservoir, a factor of great meteorological significance. The science of heat is called thermodynamics, and is of great importance in physics and chemistry. *See* F16.

Heath, flowering plants of the *Ericaceae* family. Heaths are widely distributed over uncultivated spaces of Europe and Africa. In Britain they are represented by heather (of which there are several species) and ling (*Calluna vulgaris*), which cover thousands of acres of moorland. Some of the African or Cape heaths are very beautiful and much prized by florists. One species of heath (*Erica arborea*) which grows in S. Europe and N. Africa has close-grained woody root-stock used for making briar pipes. *See* T7(2).

Heat Wave is a spell of very hot weather, due chiefly in the British Isles to a warm southerly current of air caused by the presence of an anticyclone over western or central Europe at the same time as a depression is stationary over the Atlantic. High humidity increases the discomfort.

Hegira, an Arab term signifying departure or flight, and used in reference to Mohammed's departure from Mecca for Medina, A.D. 622, from which date the Mohammedan era is reckoned.

Helicopter, heavier-than-air aircraft which obtains its lift from blades rotating above the fuselage in windmill-fashion. The first successful helicopters were the Focke-Wulf 61, a German machine (1936), and the VS-300, designed by Igor Sikorsky, flown in 1937. Helicopters can hover, and rise and descend vertically, in addition to being capable of horizontal flight.

Heliotrope, a favourite sweet-scented flowering plant, common in tropical and sub-tropical countries; the Peruvian heliotrope is the "cherry pie" of our summer garden borders. *See* T9(1).

Helium, a gaseous element first discovered by means of the spectroscope in the sun's atmosphere. This discovery, made in 1868 by the astronomer Sir Norman Lockyer, was followed in 1895 by Sir William Ramsay's proof that the element existed on earth. He found it in the uranium ore, clevite. Later it was established that helium is formed by the radioactive decay of many elements which emit α-particles (nuclei of helium atoms) and is contained in all radioactive minerals. The largest source of helium is natural gas, the richest in helium being the gas from certain wells in Utah, U.S.A. Next to hydrogen, helium is the lightest gas known, has a lifting power equal to 92% of hydrogen and the advantage that it is inert and non-inflammable. It is used for inflating airships. Ordinary air contains 1 part in 200,000 of helium. It was the last gaseous element to be liquefied, this being achieved by Onnes in 1908 in Leydon. Liquid helium has many remarkable properties only imperfectly understood. As well as being scientifically fascinating it is indispensable in cryogenics (*q.v.*) as a medium for cooling other substances to temperatures near absolute zero. Hydrogen fusion in the "H bomb" produces helium.

Hellebore, a plant of the *Ranunculaceae* (buttercup) family. The best-known British examples are the green and stinking varieties. There is also a garden kind which flowers in December called the Christmas Rose. Hellebore yields a bitter substance which forms a drastic purgative, but is now little used. *See* T9(1).

Hellenic Art. The art of ancient Greece may be roughly divided into three periods: the prehistoric period (*c.* 1500–1000 B.C.) of the bronze age Mycenaeans; the archaic period (*c.* 600–500 B.C.); and the classical period (*c.* 500–300 B.C.). Of the first period centred on Mycenae in Peloponnesus but extending to the coasts of Asia and the city of Troy we can mention only the massive stone gateways and the shaft graves of Mycenae, where the archaeologist Schliemann discovered painted vases, gold cups, bronze swords, and ornaments of what had once been a great, if primitive, civilisation. During the archaic period sculpture was the principal form of art expression. The magnificent male and female figures are reminiscent of Egyptian art, but are distinctive in liveliness of facial expression. The vase-paintings of this period became more elaborate, depicting scenes from mythology or ceremonial events. Typical of classical Greek art is the representation of the beautiful and healthy human body deliberately posed and often carrying out heroic or athletic acts. The vast majority of these statues are known to us only through Roman copies. The *Hermes* of Praxiteles (born *c.* 385 B.C.) is possibly the only existing statue which can be assigned with any degree of certainty to an individual artist. Almost the whole of the Greek genius in architecture was expended on temples which are all basically similar in design—a rectangle with a low-pitched gabled roof resting on side walls. The three orders Doric, Corinthian, and Ionic mainly referred to the type of column used, but naturally the whole building was influenced thereby. Some of the main buildings are on the Acropolis, a hill outside Athens, on which stand the Parthenon (from the outer frieze of which the Elgin marbles, now mostly in the British Museum, were taken), the Erechtheum, famous for its Porch of Maidens, and the gateway known as the Propylaea with its broad flight of marble steps. Apart from that on vases, no Greek painting has come down to us, although Greek painters existed and were noted in their time. All we have are copies in mosaic and fresco made by the Romans, at Naples and Pompeii. Of Greek literature in prose, verse, and the drama little can be said here. To the early period (*i.e.*, the archaic age) belong Homer's *Iliad* and *Odyssey*, Hesiod's long poem *Work and Days*, and Sappho's love poems, and Pindar's Odes. The period of Pericles in the 5th cent. B.C. produced more great literature than any comparable period in history: the philosophical writings of Plato and Aristotle, the tragedies of Aeschylus, Euripides, and Sophocles, the comedies of Aristophanes—all these are still part of the European tradition, and together with Greek architecture played a major part in the Renaissance (*see* J38).

Hellenistic Art, the art of the period of Greek civilisation which began with the conquests of Alexander the Great (356–323 B.C.) and lasted until his former empire (which encompassed most of the Middle East and part of North Africa) was conquered by the Romans in 146 B.C. Culturally it was an important period because it spread Greek culture far beyond its original boundaries—even as far as the north of India, and its centres spread from Athens to the cities of Alexandria in Egypt, Antioch in Syria, and Pergamum in Asia Minor. But equally Eastern culture spread to the West: democracy was replaced by absolute monarchy, cosmopolitanism took the place of the Greek tendency to believe that all who were not Greeks were barbarians, and mystical philosophies took the place of Greek rationalism. This was a sensuous, secular, pleasure-loving, rootless society, and these tendencies were reflected in its art. Hellenistic sculpture was sensual, effeminate, and violently emotional, yet it depicted individuals and not always noble or beautiful ones. (Classical Greek sculpture was idealistic, showed types rather than individuals, and appealed to the intellect rather than the emotions.) Some of the best examples came from the school at Pergamum and later from the island of Rhodes, and the titles themselves speak of their nature: *The Dying Gaul*, *Gaul Slaying his Wife and Himself*, and the famous *Laocoön* (representing Laocoön and his two sons being crushed by two enormous serpents). All these date from about 240 to 50 B.C.—for the culture did not immediately end with the Roman conquest. The enormous frieze of the altar of the temple in Pergamum depicts a battle between gods and giants with tremendous realism and brutal violence far removed from the serene art of classical times. Portrait sculpture is typical of Hellenistic art, where it may almost be said to have been invented, since such ventures in the past had been idealistic rather than realistic. The great Hellenistic cities were geometrically planned and fine public buildings made their

appearance in which the slender and graceful Ionic or the ornate Corinthian columns took the place of the more austere and heavy classical ones. Alexandria was famed for its library of 700,000 books and was the centre of philosophical schools such as the Stoics and Epicureans. Here too worked the mathematicians Euclid and Archimedes, the physicians Erasistratus and Herophilus, and the geographer Pytheas. But Hellenistic literature was a pale reflection of the glories of the past and we mention only the comedies of Menander and the pastoral verse of Theocritus of Syracuse.

Hemiptera, the order of insects to which belong the true bugs. Their wing structure is in most species incomplete, hence the term hemiptera. This order includes the familiar water insects, the water boatman and water skater, also the aphids, cicadas, leaf hoppers, scale insects. *See* **T29**(2).

Hemlock, a plant of the *Umbelliferae* family, growing in all parts of Britain, and containing a strong alkaloid poison. Used medicinally, this alkaline substance is of considerable service, being a powerful sedative. According to Pliny, hemlock was the poison used by the Athenians in putting criminals to death.

Hemp (*Cannabis sativa*), name of a plant native to Asia, now cultivated widely for the valuable fibre contained in the stalk or in some species in the leaves. Hemp fibre has been replaced by cotton for textiles and by jute for sacks and is now chiefly used for cordage and twine. It contains a resinous substance from which the narcotic hashish is made. The seed yields a valuable oil. The term hemp is also used for other fibre plants, including manila hemp from the Philippines, sunn hemp from India, sisal from W. and E. Africa and phorium from New Zealand.

Henbane, a plant found in Britain and other parts of Europe and Northern Asia. It belongs to the potato family *Solanaceae*, grows mostly on waste ground, and bears yellow-brown flowers veined with purple. The leaves yield a poisonous alkaloid substance which, medicinally prepared and administered, is of great use. Tincture of henbane is often preferred to laudanum.

Heptarchy, a word derived from the Greek *hepta*, seven, and denoting the seven kingdoms (*archai*) into which Anglo-Saxon England was divided before 900. The seven were Kent, Essex, Sussex, Wessex, Mercia, East Anglia, and Northumbria.

Heracleum, a plant of the *Umbelliferae* family, common in southern and central Europe, though only one species, the cow parsnip, grows in England. It has a bitter root, and from the juice of the stem an intoxicating liquor is occasionally prepared.

Herald, an officer of state empowered to make formal proclamations and deliver messages from the sovereign or other high personage whom he serves. In the developments which took place in armorial bearings, the herald was the functionary charged with the duty of their proper depiction.

Heraldry, the knowledge of armorial bearings, was mainly the outcome of the love of outward distinction which prevailed in mediaeval times. "Heraldry," says Stubbs, "became a handmaid of chivalry, and the marshalling of badges, crests, coat-armour, pennons, helmets, and other devices of distinction grew into an important branch of knowledge." The *shield*, or *escutcheon*, is the ground upon which armorial signs are traced, the colour of the shield being called the *tincture*, the signs recorded the *charges*. There are seven *tinctures*—*or* (gold), *argent* (silver), *gules* (red), *azure* (blue), *vert* (green), *purpure* (purple), and *sable* (black). The *charges* are classed as "Honourable" and "Subordinate" ordinaries, comprising lines and geometrical forms; and "Common" ordinaries, which latter includes all representations of natural objects. There is also a system of external signs, such as crowns, coronets, mitres, helmets, mantlings, wreaths, and crests, each having its distinctive significance. For other distinguishing marks see **Hatchments, Quartering, Rampant, Pean.**

Heralds' College or College of Arms, was incorporated by Richard III. in 1483. Its head is the Earl Marshal (an office hereditary in the family of the Dukes of Norfolk), and there are three Kings of Arms, six Heralds, and four Pursuivants. The business transacted is wholly connected with the tracing of genealogies and the granting of armorial bearings. In Scotland the Heraldic functions are performed by the Lord Lyon King of Arms.

Herbarium, a systematically classified collection of preserved plants. One of the largest in the world is at the Royal Botanic Gardens at Kew.

Heredity is the study of the transmission of physical and mental characteristics from one generation to another. Gregor Mendel (1822–84), a great experimenter in the field of inheritance, established the principle embodied in Mendel's law in his work published in 1866. The ideas which he then put forward were forgotten until the early years of this century, but today they form the basis of the modern study of genetics. Genes are the units of heredity; they are contained in the chromosomes of the cell nucleus. In human cells there are 46 chromosomes—22 pairs of characteristic shape, and a 23rd (the sex chromosomes) similar in women and dissimilar in men, which unite in the process of fertilisation. An individual can only develop, even under the most favourable surroundings, as far as his inherited characteristics, *i.e.*, his genes will allow him to do so. It is in the development of personality that the interplay between heredity and environment becomes most apparent. *See* **The Evolution of Organisms, F35–7,** *and* **Section Q, Part I.**

Hermaphrodite, animals or plants possessing both male and female reproductive organs, *e.g.*, snail, earthworms, most flowering plants.

Hermit Crab, a decapod, with a soft asymmetrical body which it protects by thrusting it into an empty gastropod shell, *e.g.*, whelk, which it carries about, only abandoning it when necessary for a larger one. Found in all seas, many live in commensal relationship with sea anemones, etc.

Heron, a large wading bird with long curved neck and pointed bill, is a member of the *Ardeidae* family, of which there are many species. Egrets and bitterns are included as herons. Herons are to be met with in marsh lands and near rivers and lakes, where they feed on fish and frogs. They nest in trees in large numbers, these colonies being called heronries. The common heron is native to England, and other species from the Continent are frequent visitors.

Herring, a common sea-fish, related to the sardine and pilchard; abounding in northern seas and found in large numbers round the British coasts. The herring fishing is the most important fish industry in this country, a large fleet being engaged in it. The fishing season proper lasts from May to October, the enormous shoals being followed as they move from place to place. The spawning season is about the end of August. One female herring may produce 20 to 50 thousand eggs, which sink to the sea-bed, where they develop.

Hibernation, the dormant condition in which numerous mammals, reptiles, amphibians, insects, plants, etc., pass the winter. The rate of metabolism slows down, and the body temperature drops to that of the surroundings. Work on these low temperatures and their physiological effect has led to improved surgical techniques. Animals of the torrid regions pass through an analogous period (aestivation) during the hot season, when the sources of food are dried up.

Hickory, several species of American tree of the walnut family, remarkable for its very hard, solid, heavy white wood, and bearing an edible, four-lobed nut.

Hieratic Art, a type of art (typified by the major part of the art of ancient Egypt) which is (*a*) exclusively religious, and (*b*) conventionally based on earlier forms and traditions.

Hieroglyphics are the earliest form of pictured symbolic expressions, and are supposed to have been introduced by the ancient Egyptians. They consist of rude depictions of animals, plants, signs, and objects, and in their later examples express, in abridged form, ideas and records from which significant historical information has been gleaned. The deciphering of

Egyptian hieroglyphics long formed an ardent study, but gradually the key to the riddle was discovered, and most of the ancient records can now be understood. Besides the Egyptian there are also Hittite, Minoan and Mayan hieroglyphic scripts. *See* **Rosetta Stone.**

Hi-Fi means high fidelity and refers to gramophones, tape recorders, and similar apparatus which will *faithfully* reproduce sounds. It is not too difficult these days to amplify electrical signals without distorting them much; it is more difficult to turn electrical impulses into exactly equivalent sound waves (with a loudspeaker, for example) or *vice versa* (with a microphone or gramophone pick-up). Pick-up and loudspeaker are therefore often the weak links in domestic hi-fi and faults in their design, deficiencies in the electronic amplifiers, imperfect gramophone motors can all contribute to audible results ranging from the tolerable to the execrable. Almost perfect sound reproduction is however available to enthusiasts possessing a suitable combination of discrimination, know-how, and financial resources. There are periodical magazines which provide guidance.

Hindi, the official language of India. *See* **M29.**

Hinduism. *See* **J21.**

Hindustani, the spoken form of Hindi (written in Devanagari script) and Urdu (written in Arabic characters). *See* **M30(1).**

Hippogriff, a fabulous animal, like a horse in body, but with the head, wings, and front legs and claws of an eagle. The monster frequently appears in the romances of the Middle Ages.

Hippopotamus or "river-horse," the largest living representative of the hog family, widely distributed over Africa, where it lives in herds. It is of immense bulk, attaining a length of 12 ft. and a weight of 4 tons and stands about 5 ft. high. Its skin is hairless and about 2 in. thick, and it has a pair of tusks often weighing as much as 6 lb. It spends most of its time in the water, and lives entirely on vegetation, both aquatic and terrestrial. The pigmy hippopotamus, which occurs in forests and swamps in W. Africa, is only half the size.

Histology is the study of the structure of plant and animal tissues. These mainly consist of groups of cells with similar functions, *e.g.*, muscle, brain tissue.

Hittites, an ancient race (often mentioned in the Old Testament) who inhabited Cappadocia (region of Eastern Asia Minor) from the third to the first millennium B.C. Excavations have revealed that they attained a high level of civilisation round about 1350 B.C. The Hittites were rivals of Egypt, disputing with the Pharaohs the mastery of the Middle East. They were the first to smelt iron successfully.

Hobby, a bird of the falcon family, 12–14 in. long. Local breeding visitor to England and Wales, April–Sept.; irregular visitor to Scotland and Ireland. They winter in Africa.

Hog, the common name of animals of the Suina family, including the wild boar, pig, and sow. The wild boar, *Sus scrofa*, is the common ancestor. The skin of the hog is covered with bristles, the snout truncated, and each foot has four hoofed toes. Hogs are omnivorous feeders and eat almost anything that is given them.

Hogmanay, the Scottish New Year's Eve festival and a national holiday of the country. The custom of demanding Hogmanay bread is still upheld in many parts of Scotland.

Hogshead, a cask of varying capacity, also a specific measure. In the old English measure a hogshead was 63 old gallons of wine (= 52½ imperial gallons). Of beer 54 old gallons make a hogshead.

Hollands, Schiedam, or **Schnapps,** a kind of gin made mostly in Holland from rye and malt, with a flavouring of juniper berries.

Holly, a hardy evergreen shrub, largely grown in England. Its bright dark green prickly curved leaves and clusters of red berries are familiar in all parts of the country, and used as house decoration between Christmas Eve and Twelfth Night, probably a relic from Roman and Teutonic customs. Its wood is white and hard, valued for carved work, while its bark yields a gummy substance which is coverted into birdlime.

Hologram, a photographic record, taken under special optical conditions, of light reflected from a scene or object. The hologram is typically a piece of film. However it is nothing like a photographic negative of the ordinary kind; for one thing it will show an unintelligible pattern of light and dark patches. Nevertheless if it is illuminated (again under special optical conditions) the light coming through it will form a *three dimensional* image of the original object. Another radical difference between a hologram and an ordinary film is that if the hologram is cut up, each fragment can be used to construct the entire image. Holography, as a method of recording and reproducing photographic information, was conceived by Gabor in 1947 but was only fully realised in practice after the invention of the laser (*q.v.*). The use of laser light is one of the "special conditions" referred to above. Technical applications are being explored in many laboratories.

Holy Alliance, an alliance ostensibly for conserving religion, justice and peace in Europe, but used for repressing popular tendencies towards constitutional government. Formed by Alexander I. of Russia, Francis I. of Austria and Frederick William III. of Prussia, at Paris on Sept. 26, 1815. Subsequently joined by all the sovereigns of Europe, except the Pope and the King of England. It ended after the 1830 revolution in France.

Holy Coat of Trèves, a garment preserved in the Cathedral of Trèves and said to have been worn by Christ. It was brought from Jerusalem by the Empress Helena in the fourth century.

Holy Rood, an annual Roman Catholic festival held on Sept. 14 to celebrate the Elevation of the Cross in commemoration of its re-erection in Jerusalem by the Emperor Heraclius in 628 after retaking it from the Persians. Also included in the Church of England calendar.

Holyrood, the ancient royal palace at Edinburgh, dating from the 15th cent., and inhabited by many Scottish sovereigns, notably Mary Stuart, the rooms occupied by her (including the one in which Rizzio was murdered) being still shown. It is now known as Holyrood House and is still used as a royal residence.

Holy Roman Empire, the title which the German Empire received in 962 when Pope John XII. crowned Otto I. at Rome. It endured until 1806 when Francis II. became Emperor of Austria.

Holy Water, water blessed by a priest and kept in small fonts at the entrance to Roman Catholic churches, and used by worshippers going in, and out, or by priests in sprinkling.

Holy Week is the week preceding Easter Sunday, and includes the days of the Sufferings of Christ, ending on Good Friday.

Honey, the sweet syrup formed by bees from the nectar of flowers, the sucrose in the nectar being converted into a mixture of the simple sugars, glucose and fructose. Hybla, an ancient town of Sicily, on the southern slope of Mt. Etna, was famous for its honey.

> "For your words, they rob the Hybla bees
> And leave them honeyless." (*Julius Caesar*).

Honey-eater, an Australian bird (of which there are many species) provided with a long curved bill and tufted tongue. It lives by sucking the "nectar" from the flowers which abound in rural parts of Australia and New Zealand.

Hookah, an Oriental pipe for tobacco smoking, the smoke being drawn through the water of a goblet (commonly a coconut shell) by means of a long flexible tube.

Hoopoe, a remarkably handsome bird with vivid black and white-barred wings and tail and black-tipped crest which opens like a fan. Ranges over Europe, Asia, and Africa. It has bred in England and Wales and occurs in the British Isles in small numbers at all seasons. Other species are confined to Africa, Madagascar, and India.

Hops, the female "cones" of the hop plant used in brewing; their essential oils give beer an aromatic flavour, and their tannin and resin act as a preservative as well as accounting for the bitter taste desired. The hop is a perennial climber belonging to the mulberry family. The male and female organs are on separate plants;

as only the female flower-heads are commercially useful, female plants predominate in a hop garden, only a very few male plants being grown so that the female flowers can be fertilised.

Horizon, the limit of vision, the apparent line where sea and sky, or land and sky meet. This is termed the *sensible* or visible horizon. An ordinary person at the height of 5 feet can see for 3 miles, at 20 feet 6 miles, at 50 feet 9½ miles, and at 1,000 feet 42 miles. The figures are approximate.

Horn *or* **French Horn**, a brass instrument of the trumpet family (*i.e.*, played by three valves) whose tube is very thin and long (Horn in F = 12 ft.) In consequence the tube is curled in a complicated manner. Owing to the sweet tone it is capable of producing, the Horn sometimes plays as part of the wood-wind.

Hornbill, large bird found in Africa and oriental regions, remarkable for its having an immense horned upward-curved helmet, growing over its downward curved beak. It inhabits tropical regions, and feeds on fruits. When the female has laid her eggs in the hollow of a tree, the male bird stops up the entrance, and keeps her imprisoned until the hatching is completed and the young ones are able to fly. There are about 45 species.

Hornblende, the commonest member of the amphibole group of minerals, a silicate of calcium, magnesium, iron and aluminium, of a dark green colour. It is a constituent of numerous rocks, including diorite, syenite, and hornblende schist.

Horned Viper, a curious African genus of *Viperidae*, with a small pointed bone over each eyebrow; a venomous species, found in Egypt, is thought by some to be identical with the "adder" mentioned in Genesis xlix. 17.

Hornet, a general name for many of the bigger wasps. It usually nests in hollow trees, and despite its rather fiercesome appearance does not sting unless unduly provoked.

Horology, the science of time-measurement, including the construction and management of clocks watches, etc. Instruments of this kind are not known to have existed before the 12th cent. and until the introduction of the pendulum in the 17th cent., clocks were ill-regulated and inaccurate. The time-recording mechanisms of the present day include (*a*) the *clock*, which shows the hours and minutes by hands, and strikes the hours, and sometimes quarters; (*b*) the *timepiece*, which is not generally a fixture and shows the time, but does not strike; (*c*) the *watch*, which is a pocket time-keeper; (*d*) the *chronometer*, which indicates the minutest portions of time; (*e*) electric timepieces, mains electric clocks; (*f*) the highly accurate quartz-crystal and atomic clocks used for astronomical purposes. *See* **Clocks**.

Horse Chestnut, one of the large forest trees, with ample branches, and full foliage, and much esteemed for parks and ornamental grounds. The bark and fruit seeds yield substances of commercial value, but the timber is not worth much. The tree came originally from Asia about the 16th cent.

Horse Guards, the building in Whitehall which until 1872 was the headquarters of the Commander-in-Chief of the British Army. The archway is still sentinelled by mounted guards.

Horse Latitudes, the latitudes of the sub-tropical high pressure systems, between the trade winds and the prevailing westerlies, characterised by light variable winds and low humidity.

Hospitallers, Knights, were of the order of St. John of Jerusalem, at first devoted to the aid of the sick, but afterwards military monks, who became prominent figures in the Crusades of the 12th cent. They adopted the Benedictine black habit with the eight-pointed cross worn by the modern St. John's Ambulance Brigade. In 1309 they took Rhodes, but were expelled by the Ottomans in 1522. In 1530 the emperor Charles V gave them the island of Malta, which, as Knights of Malta, they held until 1798, when they were dislodged by Napoleon. The Knights still survive as a sovereign order, with headquarters in Rome. *See* **Templars** and **Teutonic Order**.

Hottentots, name given to certain African natives by Dutch settlers in the 17th cent. They used to occupy the greater part of Cape Colony, and though driven out a number still survive in S.W. Africa. Appear to be related to the Bushmen, though their culture is more advanced. In addition to herding, they practise some farming and know how to smelt iron.

Hounds are dogs that were originally bred and trained for hunting, such as the greyhound, foxhound, bloodhound, wolfhound, deerhound, beagle, harrier, etc., but now often kept also as domestic dogs. The greyhound, deerhound, and wolfhound hunt by sight, the others, with the bloodhound first in order, track by scent.

Hour-glass, a glass instrument tapering to the middle to a narrow orifice, through which a sufficient quantity of fine sand gravitates to mark an hour of time. When the sand has run through from one end, it can be reversed and made to count the hour in the opposite direction. The same kind of glass with smaller supplies of sand will indicate shorter periods, as an egg-glass, which runs its course in three minutes—time to boil an egg by, or to gauge the length of a telephone trunk call.

House Flies are world-wide and prolific. Their eggs are hatched within 24 hours of being laid, and full maturity is attained in a month. They feed mainly on decayed animal and vegetable matter.

Hovercraft, or air cushion vehicle, is a craft which is lifted on a pad of air underneath it. This pad or cushion must be at a pressure higher than that of the atmosphere and it is made by sucking in air above the craft and ejecting it in a downward stream all round the lower edge. The stream is guided by a flexible skirt and the high pressure air pad is contained partly by the skirt and partly by the air stream itself which forms a continuous air curtain all round the vehicle. Hovercraft are being intensively developed and there are variations in the basic scheme just described and also in the means of propulsion which can be by air or water jets or propellers. Hovercraft were devised by Cockerell in the 1950s and a full-scale example appeared before the British public in June 1959. Craft of over 100 tons are made commercially and much bigger ones conceived. The air pad support means that hovercraft can move over land, water, or marsh. Cross-Channel hovercraft were introduced in 1966.

Howler Monkey, a genus of South American monkey noted for a laryngeal conformation which enables it to emit a loud reverberant noise something between a yell and a howl, as the name suggests.

Huanuco-bark, a medicinal bark, brought from the Peruvian town of that name, and derived from the *Cinchona micrantha* tree. *See* **Cinchona**.

Huguenots, a name applied to the French Protestant communities of the 16th and 17th cent. Henry of Navarre, by the Edict of Nantes in 1598, granted them religious freedom, but more than a quarter of a century before—Aug. 24, 1572—thousands had been put to death in the massacre of St. Bartholomew. The revocation of the Edict of Nantes by Louis XIV. in 1685 drove thousands into exile in England, Holland, Germany, and America.

Humanism. *See* J21.

Humble-bee or **Bumble-bee**, the common name of the insects of the genus *Bombus*, of the Hymenoptera order. They live in small communities comprising males, females, and drones, their habitations being underground. They do not have one queen bee only like the hive bee, but several females occupy the same nest, and these alone live through the winter, breeding and forming new colonies in the spring. Although this large bee buzzes loudly, it does not sting.

Humidity, the state of the atmosphere with respect to the water-vapour it contains. "Absolute humidity" is defined as the density of the vapour present, while "relative humidity," more frequently employed indicates the degree of saturation, *i.e.*, the ratio of the actual vapour pressure to the saturation vapour pressure at the particular temperature, expressed as a percentage.

Humming Birds are so called because of the humming noise made by the vibration of their wings in flying. They are of radiant plumage, and are among the smallest birds. The smallest bird in the world is the Fairy or Princess Helen's

humming bird of Cuba. The body is 2 in. long and the eggs are $\frac{3}{16}$ in. long. There are from four to five hundred species, and they are confined wholly to North and South America, being most numerous in the tropical latitudes. They have long, slender bills and tubular tongues which reach down into flowers to suck up the nectar on which they feed.

Hummum, the original name for what is now called the Turkish Bath in this country. One of the first of these baths to be established in London was the Hummums in Covent Garden.

Hundred, the ancient divisional name given to a portion of a county for administration or military purposes. It is supposed to imply the territory occupied by a hundred families; or the space of a hundred hides of land, or the capacity of providing 100 soldiers. Each hundred had its hundred court, with powers similar to those of a manor court, but this was abolished in 1867 by County Court Act.

Hundred Days, the interval of time between Napoleon Bonaparte's entry into Paris after his escape from Elba and his departure after his abdication, extending from March 20, 1815 to June 28 During this period occurred the battle of Waterloo, June 18.

Hundred Years' War, a term applied to the almost incessant contest between England and France, lasting from 1338 to 1453, including such famous battles as Crécy, Poitiers, and Agincourt, and engaging successively Edward III., Henry V., and Henry VI., among English kings.

Huns, a fierce Asiatic race which swept over eastern Europe in the 4th cent. Under Attila about the middle of the 5th cent. they obtained control of a large portion of central and eastern Europe, forcing even Rome to pay tribute. Their defeat at Châlons-sur-Marne in 451 by a mixed army of Romans, Goths, and Teutonic tribes, and the death of Attila in 453, terminated their empire.

Hurdy-Gurdy, an Italian rustic so-called musical stringed instrument of the lute order, the sounds of which are produced by the action of a rosined wheel turned by the left hand, the notes being made by the fingering of the right hand.

Hurricane. *See* **Cyclone** *and* **Wind**.

Hydra, an aquatic animal of simple structure, whose body is in the form of a cylindrical tube, with a disc-shaped base by which it attaches itself to any shifting substance. Its mouth is surrounded by tentacles by which it catches its food. The Hydra has the power of reproducing lost parts.

Hydrates are compounds containing water of crystallisation.

Hydraulic Ram, a form of automatic pump, used to raise water to a height by the action of its own falling velocity.

Hydraulics, the science of applied hydrodynamics, or water-machine engineering, ranging from pumps to marine engines.

Hydrocarbons are compounds of carbon and hydrogen. They include the *paraffins*, which are saturated compounds (*e.g.*, methane); the ethylene, acetylene and other series which are unsaturated; compounds with ring structures, *e.g.*, benzene, naphthalene, and anthracene. Petroleum is composed almost entirely of hydrocarbons.

Hydrochloric Acid, a solution of hydrogen chloride gas in water, and resulting in considerable quantities as a by-product of the soda-ash or salt-cake manufacture. Its solution forms the common hydrochloric or muriatic acid of commerce. It is present to the extent of nearly half a per cent. in the digestive juice secreted by the stomach.

Hydrocyanic Acid, cyanide of hydrogen or prussic acid; very poisonous, and of the odour of bitter almonds. It is formed by the action of acids on sodium or potassium cyanide. Used to kill wasps (and in the gas chamber in the U.S.A.). It is a very important chemical on account of the reactions of its derivatives in many synthetic fields. Discovered by Scheele in 1782.

Hydroelectric Schemes.—The sun's energy has been indirectly exploited in the past by harnessing the energy of the winds and rain. The climate is due, essentially, to differential heating of the earth. The resulting convection currents in the air (the motion of which is complicated by the rotation of the earth) give rise to winds. Moisture is collected from the sea and deposited high up on mountains as rain. Some of the gravitational energy may be collected as hydropower. Simple windmills or waterwheels are so undependable that they have not been used to any extent since the beginning of the Industrial Revolution. However, the modern form of the waterwheel—the hydroelectric generation plant—is extensively used in mountainous countries and about a third of the world's electricity is produced by this means. The essential requirements for a modern hydroelectric scheme are a river with a sufficient flow of water to provide the required power, a large "head" of water so that a cheap, compact turbine can be used and a dam so that water can be stored until it is required. In some cases a hydroelectric scheme is made economic by being associated with an irrigation or drainage scheme. Such multipurpose schemes are especially important in certain Commonwealth countries, notably India and Pakistan, where most hydro projects are of this type. Other well-known examples include the Snowy Mountains Scheme in Australia and the Aswan High Dam in Egypt. Although over 90 per cent of the electricity in certain individual countries, notably Norway, Sweden, Portugal, Switzerland, and Uganda is produced from hydroelectric schemes, only a relatively small fraction of the total potential has been exploited. This fraction varies from about a third in Western Europe to a quarter in the United States to a very small fraction in Alaska, Canada, Africa, and the hinterland of Asia.

Hydrofluoric Acid is obtained by distillation of fluorspar with sulphuric acid, and is a compound of fluorine and hydrogen. Its action is highly corrosive; a valuable agent in etching on glass, and a rapid decomposer of animal matter.

Hydrogen, Symbol H, the simplest element, atomic number (*q.v.*) of 1, colourless, and the lightest of all substances. Cavendish in 1766 was the first to recognise that it was an element. It is 14·4 times as light as air, and is found in a free state in volcanic regions. It can be obtained by the action of metals on acids, and forms an explosive mixture with air, burning with oxygen to form water. Commercially it is used to produce the very hot flame of the oxy-hydrogen blowpipe for cutting metals; to fill balloons and airships; to harden certain oils and render them suitable for margerine- and soap-production. The gas can be liquefied, and the presence of the isotope deuterium was detected by Urey in 1931 in the residue of the evaporated liquid. The third isotope, tritium, is very rare. *See also* **Deuterium, Tritium**.

Hydrography, the science of water measurement, as applied to seas, rivers, lakes, currents, rocks, reefs, etc., and embracing the whole art of navigation.

Hydrometer, an instrument for measuring the specific gravity of liquids, especially for ascertaining the strength of spiritous liquors and solutions. It is usually in the form of a glass bulb, to the lower end of which a smaller bulb, containing mercury, is attached, which forces the instrument to sink into the liquid which it is to test. The larger bulb has a scale fixed to it, and the indication on this scale of the sinking point shows the specific gravity. There are many varieties: Twaddell's—a pear-shaped bulb containing mercury: Beaumé's, of similar construction, but applicable to liquids both heavier and lighter than water: Sykes's, largely employed for determining the strength of alcohol: and Nicholson's, used for taking the specific gravities of solids.

Hydropathy, the method of treating disease with water, either by bathing or drinking. Natural springs of special chemical and therapeutic properties, such as sulphur springs, and other mineral sources, have been used since prehistoric times for this purpose. It is probably one of the most ancient methods of cure. Recently the beneficial effects of pure water treatment have been advocated. Hydropathic establishments have been set up in many health resorts.

Hydroponics, the culture of plants without soil. The plants are grown with their roots dipping into a solution of nutritive mineral salts; or they may be rooted in sand which is watered with such a solution.

Hydrostatics, the science of the pressure and equilibrium of liquids that are non-elastic.

Hydrozoa are a class of water animals of the *Coelenterata phylum* to which Hydra (*q.v.*) belongs. In one order of the Hydrozoa, free-swimming colonies showing marked division of labour between the individual units occur; this order includes the Portuguese man-of-war.

Hyena, a nocturnal carnivore with powerful jaws. The striped hyenas inhabit N. Africa, India, and S.W. India. The brown hyenas with long shaggy hair are natives of S. Africa. The spotted, or laughing hyena, noted for the peculiar cry from which its name is derived, is also confined to Africa.

Hygrometer, an instrument for measuring the amount of water vapour in the atmosphere. A simple form of hygrometer, known as the wet-and-dry bulb, consists of two vertical thermometers affixed to a frame. One bulb is exposed to the air, and the other is covered with muslin which dips into a water-bath to keep it moist. If the air is saturated, it takes up no moisture from the wet bulb and the two thermometers read the same. If the air is not saturated, evaporation takes place from the wet bulb, latent heat is absorbed from the air, and the temperature of the wet bulb is lower than that of the dry bulb. Relative humidity and dew-point of the air can then be derived from suitable tables. Hygrometers depending upon the expansion of human hair and gold-beater's skin and the deposition of dew on a polished surface, when cooled sufficiently, are also in general use. *See* **Humidity**.

Hymenoptera, the order of insects to which bees, wasps, hornets, ants and sawflies belong. They have a well-defined waist, two pairs of membranous wings coupled together, mouth parts modified for biting or sucking; the females possess an ovipositor used for depositing eggs and is sometimes modified for stinging. There are about 70,000 species in this order and many live in highly organised communities. *See also* **Ichneumon Fly**.

Hyperbola. A curve described by certain comets that go round the sun and never return.

Hypocaust, an arched fire vault or chamber through which heat is distributed to rooms above. Used in the baths of ancient Rome.

Hypostyle, an architectural term, designating a colonnade or pillared hall, such as in the ancient Egyptian temple of Karnak.

Hypsometer, an instrument formerly used by mountaineers to find the height above sea-level by indirectly measuring the atmospheric pressure by determining the boiling point of water at the particular height. Based on the fact that as pressure decreases with height so the boiling point is lowered. Superseded by the aneroid barometer.

I

Ibex, wild goats of several species found in the mountain regions of Europe, Asia, and Africa. The male has exceedingly large curved ridged horns. The species that lives in the Alps is called the steinbock or bouquetin.

Ibis, belongs to a family of birds related to the stork. The sacred ibis of ancient Egypt is now extinct in Egypt but is found in the lakes and swamps of the Sudan near the Upper Nile. It has white and black plumage and a long curved beak. Other species are found elsewhere, the Glossy Ibis (black plumage glossed with purple and green) occasionally visiting England.

Ice is frozen water. It is a colourless, crystalline and brittle solid. Being only 92% as dense as water, it floats on the latter; the expansion which occurs as water changes into ice causes the fracture of water-pipes, though the fracture only becomes obvious when the ice melts and leaks out through the crack. The temperature at which ice forms is 0° C., 32° F. Ice can be melted by pressure, and the ease and smoothness with which one is able to skate on ice depend on this phenomenon.

Ice Ages. Periods during which the continents were partly or largely covered by ice-sheets and glaciers. The present-day ice-sheets of Greenland and Antarctica are relics of the latest Ice Age, which began in the Pleistocene. Much of the southern hemisphere experienced an ice age at the end of the Carboniferous Period; ice ages are recorded from isolated localities during the Pre-Cambrian, but there is no evidence that these were simultaneous. *See* **F9(1), F35(2), A2.**

Icebergs are detached masses of glacier which subside into the sea and float as wind or current may take them. About one ninth of an iceberg is above sea-level. The North Atlantic is the chief home of icebergs, which reach the ocean from the ice-clad plateaux of Greenland. Some of these floating masses of ice are of enormous proportions, and constitute in the spring and early summer seasons a great menace to the safety of ships, as was disastrously shown in the *Titanic* catastrophe of 1912. For some years past these menaces to N. Atlantic shipping have been kept under close observation by vessels specially detailed for this work.

Ice-breaker, a special heavy bow-plated ship for forcing a way through ice and used especially at ports of the Baltic Sea and the Great Lakes region of Canada which freeze during the winter months. The Soviet atomic ice-breaker *Lenin*, the first of its kind in the world, launched in Dec. 1957, is designed to cut a channel through ice of any thickness. Her icebreaking performance will allow the sea-route to the north of Siberia to be kept open throughout the year.

Icelandic Literature, the Old Norse literature, centred about Iceland, which includes numerous works of poetry, mythology, and history of interest and importance. Much of this literature is in the saga form. *See also* **Edda**.

Iceland Moss, a kind of lichen (*Cetrario islandica*) which grows in great quantities in the mountain regions of Iceland and other Northern countries. It possesses certain nutritive qualities and is of some value in medicine.

Iceland Spar, a colourless form of calcite (calcium carbonate), frequently found in association with metallic ores; it has the power to produce strong double refraction of light so that two images are seen of an object viewed through a piece of Iceland spar. It was formerly used in optical apparatus for producing polarised light.

Iceni, an ancient British race who in early times lived in Norfolk and other parts of Eastern England. Their most famous ruler was Queen Boadicea, who led her people against the Romans in A.D. 61.

Ice Plant, also called "dew plant" and "diamond plant." A South African mesembryanthemum commonly grown in British gardens. Introduced in 1690.

Ice Saints, St. Mamertus, St. Pancras and St. Servatius, so called because of the legendary cold on these Saints' Days, namely, May 11–13.

Ichneumon, the Egyptian mongoose, popularly known as "Pharaoh's Rat." It is of great use in checking the multiplication of reptiles. It is frequently domesticated.

Ichneumon Fly, a numerous group of parasitic hymenopterous insects abounding in many lands, and all having the peculiarity of depositing their eggs in the bodies of other insects. It destroys swarms of caterpillars, which become the unwilling hosts of its progeny.

Ichthyology, the natural history of fishes.

Ichthyosaurus was a gigantic marine reptile of the Mesozoic age. The fossils are mostly found in the lias formation. Some were over 30 ft. in length.

Icons. Icons are religious paintings designed for devotional use either by the individual or in church rituals. In size they range from the very small to large ones in two or three panels on church screens dividing the nave from the chancel (these are known as diptych and triptych respectively). The icon style of painting derives from the tomb paintings of Hellenistic and Roman Egypt, where it had become the custom to leave a portrait of the dead over the mummy's face. Icons of the earlier periods are rare, those of the 6th cent. probably having been destroyed and those of the 9th–12th cent. mostly removed to Russia. They were essentially simple with the Virgin and Child, or the Virgin, Christ, and John the Baptist as subject. From the 13th cent. icons were more complex, dealing with New Testament scenes or scenes from the lives of the saints,

and by this time schools of painting, each with their own style, were arising in other countries, including Russia, which accepted the Eastern Church. The 16th-cent. icons begin to show Italian influence just as Italian painting was influenced by Byzantine. Most icons were painted on wood, but mosaic was sometimes used, and some icons were of metal.

Ides, in the ancient Roman Calendar, the 15th of March, May, July, October, and the 13th of all other months; always the eighth day after the Nones.

Idiom, an expression characteristic of a country, district, dialect or language, which usually gives strength and force to a phrase or sentence. The idioms of a language are its distinctive marks, and the best writers are the most idiomatic.

Idris, a famous giant belonging to the myths of Wales, commemorated by a chair of rock on the top of the Cader Idris mountain in Merionethshire.

Igneous Rocks are such as have been molten under conditions of great heat at some stage in their history: *e.g.*, granite, basalt. *See* F8(2).

Ignis Fatuus *or* "Will-o'-the-wisp," a phosphorescent light which may often be seen on summer and autumn evenings hovering over marshy ground or graveyards. Its nature is hardly understood, though it is generally believed to be the result of the spontaneous combustion of the gases from decaying organic matter. In olden times when marshy grounds were more common than now, this "dancing light" was very frequently visible and was regarded with superstition.

Iguana, large South American lizards, with a long tail, a scaly back and head, a thick fleshy tongue and a prominent dew-lap in the throat. Specimens of the different species average 4–5 ft. in length, and they live mostly in trees, though they are equally at home on land or in the water. The flesh of some species is good eating, as are also the eggs.

Iguanodon, a genus of extinct dinosaurs, whose fossils are found in the Jurassic and Cretaceous rocks. Iguanodons were 15–25 ft. long, and walked on their hind legs, the front legs being small and adapted for grasping the branches of trees on the leaves of which they fed.

Ilex, mentioned by classical authors, is the holm- or holly-oak, which flourishes round the Mediterranean. To botanists Ilex is the genus to which the holly and maté plant belong. *See* T9(2).

Iliad, the great epic poem of ancient Greece attributed to Homer (*c.* 700 B.C.). It consists of ancient folk tale and saga, welded into an artistic unity, having as plot the carrying off of Helen by Paris to Troy and the subsequent siege of Troy. *See* H19.

Illuminated MSS. of great value and beauty of decoration exist in most public museums and in many private collections, some of them being of great antiquity, especially those of ancient Egypt executed on papyri. Greek and Latin specimens are also numerous, and the British Museum contains fine examples of all these kinds and also an extensive collection of mediæval English MSS.

Ilmenite, a mineral widespread in igneous rocks: chemically it is an oxide of iron and titanium. Rich deposits have recently been found in the Allard Lake area of Quebec; the Travancore sands are also a source of ilmenite.

Immortality. *See* J22.

Immortelles are wreaths, crosses, or other designs made from what are called everlasting flowers, which are obtained from certain plants of the Composite order, and retain their colours and compactness for a long time. Immortelles are largely used as mementoes for decorating graves, especially in France.

Impeachment, a special arraignment, usually before Parliament or other high tribunal, of a person charged with some offence against the State. The custom in England was for the impeachment to be made in the House of Commons, and the trial to be before the House of Lords. The first instance occurred in 1376 when Lord Latimer was impeached. With present parliamentary procedure, impeachment is no longer necessary, since the Cabinet is responsible for the individual actions of its ministers, who, acting as a team, must carry the Commons with them, or resign, when it falls to the Leader of the Opposition to form a new Cabinet. Other famous impeachments were those of the Lord High Chancellor Francis Bacon (1621), Earl of Strafford and Archbishop Laud (1640), Warren Hastings (1788), the last being that of Lord Melville (1805). Under the constitution of the United States public officials may be impeached by the House of Representatives and tried by the Senate. The most famous case was that of President Andrew Johnson.

Imperialism. *See* J22.

Impluvium, a basin or tank in the hall or atrium of an ancient Roman house, serving the purpose of receiving the rain that dropped through the open space in the roof.

Impressionism, the name given contemptuously to the first modern movement in painting, being derived from the title of Claude Monet's picture *Impression: soleil levant*, which showed the play of light on water with the observer looking straight into the rising sun. Although intended to be the ultimate form of naturalism the inspiration of the school had been the scientific study of light with an attempt to render the play of light on the surface of objects. Feeling that putting a line around a form was bound to cause it to look unnatural, they used bright colours corresponding to the spectrum and unmixed on the palette, and noted that an object of any given colour casts a shadow tinged with the complementary one (*e.g.*, red-green, yellow-blue). Hence bright sunlight was represented in clear yellows and orange with violet shadows. The first Impressionist exhibition held in Paris in 1874 aroused derision with its paintings by Monet, Renoir, Sisley, Pissaro, Cézanne, and Degas among others. Impressionism subsequently led to the entirely artistic and anti-naturalist movement of Post-impressionism. Cézanne, who felt that he wanted to produce "something solid and durable, like the art of the museums," was only dubiously impressionist, as were also Degas and Renoir. Of course, in the wider sense of the word (*i.e.*, the recording of an ephemeral impression of a scene), Whistler, Turner, and even Rembrandt used the technique.

Impressment, the forced seizure of persons for military service resorted to by many countries before the establishment of conscription. Press gangs forcibly recruited men for British warships especially during the Napoleonic wars, but such measures were abandoned after about 1850.

Imprimatur, originally an official licence to print, and an important formula in the early days of printing. The term is now used in the wider significance of authority, or endorsement.

Inbreeding, mating of closely related animals and plants. Close inbreeding has long been held to be harmful, but this is not necessarily so, for if practised with selection, stock can be purged of the undesirable qualities and the race improved.

Incas, an Indian people who inhabited ancient Peru, founded a great empire, and reached a high level of civilisation: overthrown by the Spaniards in 1533.

Incense, an aromatic resinous substance which, under combustion, exhales a pungent odour, and is used, mixed with certain fragrant perfumes, in the celebration of Mass in Roman Catholic churches. Olibanum or frankincense is ordinarily the leading ingredient.

Incisors, the sharp-edged cutting teeth at the front of mammalian jaws. Rodents have long, sharp incisor teeth. Elephant tusks are modified incisors.

Income Tax, a tax on annual income charged under the following schedules:

Schedule A.—On the beneficial occupation of land (including buildings). Finally abolished as from 1964–65. Rents now assessed under Schedule D.

Schedule B.—Abolished as from 1963–64 on amenity lands (parks, gardens). Restricted to woodlands managed on a commercial basis.

Schedule C.—On dividends, interest, annuities from public revenue. Income Tax deducted at source.

Schedule D.—On profits from trade, profession, or vocation; remittances from abroad; interest on government stocks not taxed at

source, Post Office Savings, etc.; sundry profits; short-term gains; rents.

Schedule E.—On salaries, wages, pensions, emoluments, directors' fees, etc. Taxed under P.A.Y.E.

The income-tax year is from April 6 to the following April 5. Rates of tax on taxable income for the year 1968–69 are as follows:—on the first £100, 4*s*. in the £; on the next £200, 6*s*.; and on the balance 8*s*. 3*d*. in the £. *Taxable* income is found by deducting from *Total* income certain allowances.

(1) *Earned Income* allowance of two-ninths to £4,005 and one-ninth to £9,945.
(2) *Personal* allowance of £220 to single persons and married women in employment; to married man living with his wife, or if wife though not living with, is wholly maintained by means of a voluntary allowance, £340. If the wife is maintained under a Court Order or under a binding legal agreement the allowance is reduced to £220. Personal allowances for a parent reduced by £36 for each child for whom family allowance is due.
(3) *Child* allowance of £115 for each child under 11; £140 over 11; and £165 over 16 if still being educated; provided child does not have income in own right of more than £115. With effect from 1969–70, investment income of minor children aggregated with that of their parents.
(4) *Dependent Relative* allowance, £75; for single woman, widow, divorced or separated woman solely supporting dependent relative, £110. (Certain restrictions depending on dependent's own income.)
(5) *Daughter's Services*, necessary owing to old age or infirmity, allowance of £40.
(6) *Housekeeper* allowance of £75 (certain restrictions).
(7) *Age* allowance of two-ninths of unearned income where taxpayer (or his wife) is over 65 and total income does not exceed £900. Marginal allowances.
(8) *Life Insurance.* Life assurance policies taken out after 19 March 1968 which do not satisfy certain new conditions do not qualify for income tax relief on premiums and are subject to a charge to surtax in respect of the proceeds (less premiums).

Age Exemption: no tax payable by single persons aged 65 or over if income does not exceed £415; £665 for married couples where either is 65 or over. Appropriate marginal allowances.

Pensions qualify for the earned income relief of two-ninths.

Small Income Relief. All incomes up to £450 are treated as Earned Income.

Surtax is on a sliding scale, increasing from 2*s*. in the £ with the size of the income. Surtax on earned income, in effect, begins at £5,000, or more if personal reliefs are due. A special charge on investment income above £3,000, after deduction of personal allowances allowed for surtax, imposed for 1967–68. *See also* Surtax.

Independence Day, commemorates the adoption of the Declaration of Independence on July 4, 1776. July 4 is celebrated as a holiday in the United States.

Index. The name given to a list of books, prepared by papal authority, which are declared to be dangerous to faith and morals, and therefore forbidden to Roman Catholics, called the *Index librorum prohibitorum*. One of the reforms of the Vatican Council was the closing in 1966 of the Curia office which judged writings for the Church's Index of forbidden books, though the Index itself still remains. The Pope ordered that nothing should be placed on the Index until the author had been given a chance of explaining his views. The first Index was issued by Pope Pius IV, in 1559.

India Office Library (since 1947 called the Library of the Commonwealth Relations Office (Division B)). This is an orientalist library, which specialises in Indian studies. It was founded in 1801 by the East India Company, and contains 20,000 manuscripts in European languages and in Sanskrit, Persian, modern Indian, and other oriental languages, and a quarter-of-a-million printed books, of which three-quarters are in oriental languages. There are also collections of drawings, photographs, and other objects of oriental interest. It was announced in 1965 that a judicial tribunal was to decide on legal ownership of the library.

Indian Ink, a pigment made from lampblack and gum or glue, originally prepared in China and Japan. It is dried and marketed in small sticks and used mainly by artists for shading and lettering.

Indian Mutiny. This turning-point in the history of modern India occurred in 1857–58. The ostensible cause was the serving out to the native troops of cartridges greased with animal fat, for contact with this was forbidden both by the Hindu and Mohammedan faiths. A rebellious feeling, however, had long been developing, and when the Sepoys at Meerut in May 1857 refused to obey the English officers, overpowered and put them to death, the mutiny spread like wildfire. The rebels took Delhi and Lucknow, and for many months terrible massacres and atrocities were committed: men, women and children were slain in thousands. Order was re-established in the autumn of 1858 when the governing power was transferred from the East India Company to the Crown.

Indian Summer is applied to a warm spell of weather occurring in the late autumn.

Indicators, substances which by a marked change in colour are used to indicate the course of a chemical reaction. Litmus paper, for instance, is red with acids and blue with alkalis. In biological work some radioactive substances are used as tracer elements.

Indigo, the substance obtained from the plant *Indigofera tinctoria*, a native of S. Asia, India being the chief producing country. The colouring matter is the result of the decomposition and fermentation of a glucoside contained in the plant. This is afterwards dried and becomes the caked indigo of commerce. Natural indigo has been eclipsed by artificial indigo, a coal-tar dye which came into commercial production at the end of the last century, which is cheaper and more uniform in quality.

Indium, a scarce lead-coloured metal, symbol In, found in zinc blende in Saxony and certain other ores. This element was discovered in 1863 by Reich and Richter. It is an important material in the manufacture of transistors.

Indo-European Languages. *See* M30.

Indulgence. In the Roman Catholic Church the remission granted by ecclesiastical authority to a repentant sinner of the temporal punishment still due after the guilt of sin has been forgiven by God. The indiscriminate sale of Indulgences by Tetzel and other Papal agents in the 16th cent. was one of the grievances which led to the Reformation (*see* J38).

Indulgence, Declaration of, was the proclamation by which James II. suspended the penal laws against Roman Catholics and Dissenters. It was issued in 1688, but the clergy as a body refused to obey, and the trial of the Seven Bishops and their acquittal by a jury followed. An invitation was thereupon sent to William of Orange to become King.

Industrialisation is simply a name for industrial development. It is customarily used in particular to designate the course of events in a hitherto underdeveloped country which is seeking to increase its wealth and productivity by the introduction of more advanced techniques and by the establishment of industries previously not carried on within it. The word usually covers not only the development of modern industrial production but also the provision of electric power-stations, irrigation works, and transport and other developments designed to improve production in any field by methods involving large capital investments. The outstanding example in our time of rapid industrialisation has been the Soviet Union, which, unable to get the capital from abroad, has had to carry it through by ruthless restriction of the people's consuming power so as to achieve an unprecedentedly high ratio of investment to total production. Industrialisation has in practice meant a high concentration on the

expansion of the basic heavy industries and of power supply, coupled with much slower development of the industries supplying consumers' goods and of agricultural production; but there is no reason why this should always be the case. It may well be that in most underdeveloped countries development can but be devoted largely to the industries making consumers' goods and to measures designed to increase agricultural production and productivity.

Industrial Revolution. The name, first given by Engels in 1844, to describe the radical changes that took place in Britain during 1760–1840 to transform a mainly agricultural country into one predominantly industrial. It began with the mechanisation of the textile industry (Hargreave's spinning jenny, 1764, Arkwright's water-frame, 1769, Comptons' mule, 1770, and Watt's steam-engine, 1785), with subsequent major developments in mining, transport, and industrial organisation. It was based on Britain's rich mineral resources, particularly coal and iron ore. With the use of the steam-engine as power industry became concentrated round the coalfields and the great new industrial towns developed—Birmingham, Manchester, Newcastle and Glasgow. Britain became supreme in constructional ironwork (Telford, George and Robert Stephenson). Canals, bridges, railways, and ships were built, and great advances were made in the practical application of scientific principles. Aided by colonial exploitation Britain became the most prosperous country in the world. The new industrial capitalists began to replace the country squires as ruling class. But the great accumulation of wealth at one pole of society was matched at the other by poverty and misery, for child labour, long working hours, low wages, and slums were features of the industrial revolution in its infancy. As with all great technological developments, the industrial revolution produced related changes in all fields of social life—in politics, art, religion, literature, and morals, and with the rise of democracy, social reforms. *See also* **Section Q, Part II.**

Inertia, a term used in mechanics for the property of matter by which it offers resistance to a change in its state of rest or in its state or direction of motion.

Inertial Navigation, an automatic method of dead-reckoning which at present finds its chief application in guided missiles, submarines, and aircraft. Navigation by this means is carried out with reference to inertial space (*i.e.*, space which is stationary with respect to the fixed stars) and not to the surface of the earth as in normal navigation (latitude and longitude). This is done by means of high-accuracy gyroscopes combined with highly sensitive accelerometers in an apparatus known as the Ship's Inertial Navigation System. The American nuclear-powered submarine *Nautilus* pioneered the new north-west passage under the polar ice pack by this method of dead-reckoning in Aug. 1958.

Inflorescence, a flowering shoot. Many arrangements of the flowers are possible and there are many kinds of inflorescence; *e.g.*, the spike, catkin, umbel, capitulum (in composites).

Inflation. *See* **G4(2).**

Infra-red Rays *or* **Radiation.** This is the range of rays which come between the visible red rays and the ultra-short Hertzian radiation. The wave-lengths involved range from about 0·00076 millimetre (7,600 Angstrom units) to 0·4 millimetre. Infra-red rays penetrate haze; hence landscapes obscured by haze or cloud can be photographed using plates sensitive to infra-red. Many substances strongly absorb these rays and thereby become hot; this happens in toasting bread. Many industries use infra-red lamps for drying paints and lacquers. Very important to chemists, as a tool in the investigation of the structure of compounds, since various groups of elements absorb infra-red radiation at a characteristic frequency.

Infula, a sacred fillet, of woollen material, worn on the forehead by priests, magistrates and rulers in Roman times, also by persons fleeing for protection to sanctuary. Later, each of the two lappets of a bishop's mitre.

Ingoldsby Legends, a series of whimsical metrical tales full of droll humour written by the Rev. R. H. Barham, and first published in *Bentley's Miscellany* in 1837. The best known is the *Jackdaw of Rheims*.

Ink, a liquid pigment ordinarily made from an infusion of nut-galls, copperas, and gum arabic. Shumac is substituted for nut-galls for inferior inks. An acid is sometimes added to prevent oxidation, and for the blue-black inks a small quantity of solution of indigo serves for colouring. Copying ink contains glycerine or sugar, which keeps the ink moist. Lampblack used to be the leading ingredient in printer's ink but now new methods of manufacturing have been developed. Marking ink is composed of a solution of nitrate of silver, gum, ammonia, and carbonate of soda. For red, blue, and other coloured inks, colouring solutions are used, for example, Prussian blue. The earliest examples of ink writing (on wooden tablets) ever found in Britain were recovered from the well of a Roman villa (3rd cent A.D.) during excavations in 1954 at Chew Stoke, Somerset.

Ink Sac, a glandular organ found in squids and other cephalopods which contains an inky solution. When roused the animal discharges the contents of the ink sac into the water, to make a cloud through which its enemies cannot see. The pigment, sepia, comes from the ink sac of the cuttlefish.

Inlaying is the introduction of one class of substance into another in some artistic or other design, such as silver let into zinc, copper, or lead, and called *bidri*; the insertion of gold and silver into iron or steel, which is *damascening*; the mingling of brass with tortoiseshell, *buhl work*; the inlaying of woods, *marquetry*; of stone, *pietra dura*; and of the arrangement of small pieces of stone, for floors, walls, etc., *mosaic*.

Innocents' Day, a festival day in Roman, Greek, and Anglican Churches in commemoration of the killing of the children of Bethlehem by Herod, Dec. 28.

Inns of Court, the four bodies in London which enjoy the privilege of calling candidates to the bar after they have studied for a certain number of terms and passed certain examinations. The Inns are: the Inner Temple, the Middle Temple, Lincoln's Inn, and Gray's Inn.

Inquisition, a Roman Catholic ecclesiastical court which became a formidable weapon of the Church in the 13th cent. under Pope Innocent III. in dealing with charges of heresy. It was effectively set up in the various Catholic countries of the Continent, obtaining its fullest and most sweeping organisation in Spain in the days of Ferdinand and Isabella, when Torquemada was made Grand Inquisitor, and used its powers with terrible severity. *See* **Auto-da-fé.** In the 18th cent. its influence began to wane, and the jurisdiction of the Congregation of the Holy Office at Rome was limited to the suppression of heretical literature (*see* **Index**).

Insectivorous Plants, plants which trap insects with special mechanisms. Plant enzymes or bacteria digest the prey, providing the plants with nitrogen usually scarce in the soil in which they grow. The most common British species are the Sun-dew and the Bladderwort.

Insects. This huge class of invertebrate animals (*see* **Arthropods, (F26)**) includes about 100,000 species. Insects are ubiquitous except in the sea, only a very few species being adapted to marine existence. Characteristic features are: the body is divided into three parts, head, thorax, and abdomen: the head carries a pair of antennae, the thorax three pairs of legs, and usually two pairs of wings. The most primitive insects constituting the sub-class *Apterygota* are wingless. The other sub-class, *Pterygota*, is divided into the *Exopterygota* (*Hemimetabola*), which have a simple metamorphosis, *e.g.*, cockroach, and the *Endopterygota* (*Holometabola*), with a complex metamorphosis, *e.g.*, butterfly, bee. Although many are parasitic on man, animals and plants, innumerable animals and some plants use them as food, and many flowering plants are dependent on a variety of insects for pollination leading to the development of seeds and fruits. *See* **F26(1), 31(2), T28(1).**

Insignia, marks or badges of office or honour, such as stars, ribbons, crosses, medallions or other

designating objects, worn by members of special Orders or holders of prominent offices.

Instinct.—*See* F31(1).

Institut de France was formed in 1795, and after various modifications was in 1832 organised on its present basis. Its five academies are—the Académie Française, Académie des Inscriptions et Belles-Lettres, Académie des Sciences, Académie des Beaux-Arts, Académie des Sciences morales et politiques. It is restricted to 40 members.

Instruments, Musical. Musical instruments may be classified in a number of ways, but in general they fall into one of the three main classes, String, Wind, and Percussion, according to how the sound is produced. **Stringed Instruments** are those which produce the sound by the vibration of a string: (*a*) by plucking, as in Harp, Lyre, Psaltery, Zither, Lute, Guitar, Balalaika, Ukelele, Harpsichord; (*b*) by friction (bowed), as in Crwth, Rebec, Viol, Violin, Marine Trumpet, Hurdy-Gurdy; (*c*) by striking (hammered), as in Dulcimer, Pianoforte, Clavichord; (*d*) by wind (blown), as in the Aeolian Harp. **Wind Instruments** are those in which the air in the instruments is set in vibration: (*a*) by blowing into a tube (flue-voiced), as in Recorder, Pandean Pipe, Flute, Organ; (*b*) by means of reeds (reed-voiced), as in Oboe, Clarinet, Saxophone, Bagpipe, Cor Anglais, Bassoon, Organ reed-stops; (*c*) those in which the sound is produced by the vibration of the player's lips against the mouthpiece (lip-voiced), as in Bugle, Horn, Trumpet, Tuba, Trombone, Saxhorn, Flügelhorn, Cornet. In a modern orchestra these are known as the *Brass*: instruments of the flute, oboe, and clarinet families as the *Woodwinds*. Then there are the **Percussion Instruments**, which include the Drums, Cymbals, Tambourines, Castenets.

Insulator, a substance that will not conduct electric current. Many solids, liquids, and gases are important insulators—rubber, cotton, silk, plastics, porcelain, glass, air, oil. If the applied voltage is too high, all insulators will " break down ", *i.e.*, conduct electricity perhaps with resulting breakage, puncture, or charring. Thermal insulators will not conduct heat; they are usually the same kinds of substance as electrical insulators.

Insulin is a hormone which controls the supply of sugar from the blood to muscles. The breakdown of sugar provides energy. In diabetes there is a lack of insulin, causing a build-up of blood sugar which can be released by the injection of insulin. It is secreted by the islet tissue of the pancreas, from which it was isolated in 1922 by Banting and Best. Dr. F. Sanger of Cambridge University was awarded the 1958 Nobel Prize for his work in determining the chemical structure of insulin.

Intaglio, engraving or carving on a sunken ground, a method frequently adopted in the ornamentation of stones and rings.

Intelligence. Intelligence has been variously defined as " the ability to learn and understand ", " the ability to see the relationships between things " and " the ability to profit from experience." The idea of intelligence testing was first devised by the French psychologist Binet at the beginning of this century. He was asked by the French government to invent a test which would weed out backward children in state schools, and thus save public money and avoid holding back the work of the class by teaching children who were incapable of learning at a given standard. Briefly, a series of problems are given to a large number of children and it is thus found out which series can be solved by the average child of a given age-group; if a child of 7 can only pass the tests suitable to the average child of 6, then his mental age is 6. The intelligence quotient or I.Q. is discovered by dividing his mental age by his chronological age. For example, if a child is 7 years and 1 month old, we may begin by giving him tests at the 6-year level. If he passes all these plus four for age 7, three for age 8, and one for age 9, his mental age is calculated by crediting him with 72 months for passing all tests at age six and two months mental credit for each additional test passed, *i.e.*, 8 months at age 7, 6 months at age 8, and 2 months at age 9. His total mental age (M.A.) is therefore 88 months, and since his chronological age is 85 months, the I.Q. is 88/85. To remove the decimal point, the result is multiplied by 100, giving an I.Q. of 104. Although I.Q. tests are the standard method of estimating intelligence, they are not universally accepted as a criterion; a teacher's general judgment may be the best assessment. Great intelligence may be inherited, but fail to develop to the full because facilities for education are not available. A gifted child can usually be spotted at an early age. *See also* Section Q, Part I.

Interest is the payment made for the use of borrowed money over time. The rate of interest is the rate per cent per annum charged for such loans. There are many such rates, varying with the plenty or scarcity on borrowable money, with the length of time for which the loans are made, and with the degree of risk, if any, that the loans will not be duly repaid. Short-term loans are usually cheaper than long-term: the lowest rates are usually for " call money " repayable immediately on demand. These are used principally in short-term financial transactions, such as bill discounting. Bank loans, though usually made for fairly short terms, command higher rates. Long-term loans are made chiefly to public authorities, or as bonds or debentures to business concerns. The rates obtained vary with the demand and the supply of such accommodation.

Interferon, the name given to a substance discovered in 1957 by Drs. Isaacs and Lindenmann at the National Institute for Medical Research. It is produced by the interaction of viruses with living cells and has the important property of inhibiting virus reproduction. Its development may lead to a new approach to the therapy of viral diseases.

International Date Line, a line along the 180° meridian marking the difference in time between E. and W. For the westward-bound traveller crossing the line the date would be put forward one day, for the eastward-bound, back one day. To avoid difference of date in adjacent land areas, the line deviates from the 180° meridian where this crosses land.

Interval, in music indicates the differences in pitch between two notes. This is often expressed numerically. Thus the interval between C and the E above it is a major third, that between C and E flat is a minor third, that between C and G is a fifth, that between C and A is a sixth.

Introit, the psalm or hymn in common use in the Anglican Church, which is sung as the clergy enter the church to commence the divine service of Holy Eucharist.

Invention of the Cross, a Roman Catholic festival held on May 3, to celebrate the finding of the alleged True Cross at Calvary by the Empress St. Helena in 326. Also included in the Church of England calendar. *See* Holy Rood.

Iodine, a non-metal element, symbol I, member of the halogen family (*q.v.*), a substance formerly exclusively obtained from the ribbon-wrack seaweeds. These were burnt and the ashes (kelp) extracted with water. After concentrating the iodides, these were distilled with manganese dioxide and sulphuric acid to yield iodine vapour which was condensed in stoneware bottles. Nearly all iodine now in use is derived from the iodine salt present in Chili saltpetre (sodium nitrate). Iodine is used in photography, as an antiseptic solution in alcohol or potassium iodide (tincture of iodine), and in medicine. Discovered by Courtois in 1812.

Ions, electrically charged atoms, or groups of atoms. Atoms of the metals lose electrons to become positively charged ions, *e.g.*, the sodium ion (Na^+) has one electron less than the atom. The non-metal ions are negatively charged, *e.g.*, the chloride ion (Cl^-) has one electron more than the atom. Similarly, a group like the sulphate ion (SO_4^{2-}) has more electrons than the constituent atoms. Thus, the hydrogen atom without its electron is a hydrogen ion or *proton* and the helium atom without its two electrons is a helium ion or *alpha-particle*. When an electric force is applied to certain solutions, the ions into which molecules of the dissolved substance are broken up are attracted

to the oppositely charged electrodes, their movements constituting an electric current through the solution. In the same way gases, including air, conduct electricity by virtue of free ions (*see* F12(2)). Combustion, radioactivity, and ultra-violet and cosmic radiations produce ionisation.

Ionic Order of architecture is one of the five classic orders, its leading characteristics being the volute of its capital, which has on each side distinctive curved or scrolled ends.

Ionosphere, a succession of ionized layers of the earth's atmosphere lying above the stratosphere. In this region free electrically charged particles—electrons and positive ions—occur in sufficient concentration to affect substantially the propagation of radio waves through the region. It extends upwards from a height of 60 miles to several hundred miles, being most concentrated at an altitude of 200 miles. The behaviour of the upper atmosphere is strongly influenced by the sun. A great deal of new information about the ionosphere above an altitude of 150 miles (the topside ionosphere) has been obtained by the use of instruments carried in satellites. *See also* Atmosphere.

Ipecacuanha, a flowering plant of the Brazilian forests. Various alkaloids are isolated from ipecacuanha, one is emetine, which is used in medicine to cause vomiting and so remove poisons from the stomach. Another is used as an expectorant in cough mixtures.

Iridium, a white and very hard metal, symbol Ir, discovered by Tennant in 1804. It occurs naturally as an alloy with platinum or osmium; tips for fountain-pen nibs have been made from the former native alloy. The former standard metre was composed of platinum–iridium alloy (*see* Metre) as are parts of scientific apparatus and surgical tools that must be non-corrodible.

Iris, the typical genus of the botanical order *Iridacae*, with tuberous rhizomes and sword-shaped leaves, many of the family having beautiful flowers. About 100 species of Iris are recorded from the northern temperate zone, the most common species wild in Britain being the yellow flag. Orris root, used in perfumery, comes from another iris species.

Iron is a metallic element, symbol Fe (Latin *ferrum*), ocurring widely in nature in such ores as haematite, loadstone (magnetic iron oxide), spathic ore, and iron pyrites. It is extracted by a process known as smelting, with coke and limestone in a furnace. Its many uses are familiar, the most important being in the manufacture of cast- and wrought-iron products and of steels, which are alloys mainly of iron with added carbon and various metals. Iron rust is formed by the action of oxygen and water, and is a coating of iron oxide. *See* Smelting.

Ironclads, ships of war cased in iron or steel plates of sufficient thickness to resist projectiles. They were first introduced (1858) in the French Navy, and in 1860 the first British ironclad, the *Warrior*, was launched.

Iron Curtain. In a speech at Fulton, U.S.A., on March 5, 1946, Sir Winston Churchill used this phrase to describe the dividing line behind which, he said, lie all the capitals of the ancient States of Central and Eastern Europe—Warsaw, Berlin, Prague, Vienna, Budapest, Belgrade, Bucarest, and Sofia. These famous cities and the populations around them, said Sir Winston, lie in the Soviet sphere and are subject "to a very high and increasing measure of control from Moscow."

Ironsides were Cromwell's special troopers, so called because of their solidity and firmness in battle.

Irredentists, a political party organised in Italy about 1878 with the object of incorporating within Italy neighbouring regions. Also a person, group, or party advocating policies for the restoration to their country of territory formerly belonging to it but later lost.

Irrigation, an artificial method of providing water for the growth of plants on lands where the natural supply of water is deficient. The science has made immense progress during the last fifty years, and has been the means of bringing into profitable cultivation vast tracts of territory in India and Western America which had previously been arid wastes. The systems are various and are utilised according to the special conditions of the land to be irrigated, but the success which has attended these experiments has been very gratifying. In fact, irrigated lands are often more productive than lands which receive a fair amount of moisture from the elements; the irrigation supply can be distributed and regulated exactly according to requirements. Irrigation also serves the purpose of supplying *warmth* in winter; *e.g.*, in the English water-meadows, and in the more highly developed Italian *marcite* and winter-meadows, where the water is mostly applied in winter when there is plenty of rain. There are several other functions of irrigation; *e.g.*, washing out of excess salts.

Isinglass, a gelatinous substance manufactured from the swim bladders of certain fish; used to preserve eggs, to keep beer free from sediment, and to make a glue.

Islam. *See* J23.

Isobars are the lines drawn on charts linking together points of equal barometric pressure.

Isochasms, lines connecting places at which there is an equal probability of seeing an aurora, taking the average over a number of years, based on the auroral catalogue of Fritz.

Isomers are chemical compounds having the same composition but different structural arrangements, and consequently different physical and chemical properties. For example, ethyl alcohol and methyl ether are isomers, since the molecules of both are built up of two atoms of carbon, six of hydrogen, and one of oxygen, *viz.*, C_2H_6O: ethyl alcohol, C_2H_5OH; and methyl ether, CH_3OCH_3.

Isotherms are lines drawn on charts through points of equal temperature.

Isotopes. When one talks of an element, say, uranium or lead, the name of the element is a generic name for a collection of uranium species and lead species. The different species are called isotopes. For any particular element, the number and arrangement of electrons around the nucleus are the same in all the isotopes, so all the isotopes have the same chemical properties. Soddy has described isotopes as "elements, the atoms of which have similar outsides but different insides." For example, in the nucleus of the uranium isotopes, U 235, U 238, and U 239, there are respectively 143, 146, and 147 neutrons, but all have 92 protons. The isotopes have different atomic weights, in this instance respectively 235, 238, and 239. But all have the same chemical properties. *See* F10.

Ivory, the dentine substance of which the tusks of the elephant, hippopotamus, walrus, etc., are composed. The tusks of the African elephant sometimes weigh as much as 100 lb., and reach a length of 8 or 9 ft.

Ivory Gull, a small, beautifully shaped sea-bird with striking all-white plumage and black legs which breeds on the rocky shores of the Arctic, being found farther north than any other bird; it occasionally wanders south in the winter.

Ivy, the well-known climbing shrub, chiefly evergreen; furnishing a sudorific, the berries having also emetic properties.

J

Jabiru, the Brazilian name for the giant stork of South America.

Jacamar, from *Jacameri*, the Brazilian name for a smallish bird with long, sharply pointed bill and brilliant plumage which inhabits the tropical regions of South America east of the Andes. These birds are seen sitting motionless on trees, darting off at intervals, like flycatchers, to catch insects on the wing.

Jacana, a tropical bird (the water-hen of Brazil and the warmer parts of America) of wide range, beautiful of plumage, with slim body and narrow wings, and long, pointed beak. It feeds on seeds and insects, inhabits marshy lands, and is related to the plovers.

Jack, a small schooner-rigged vessel, used in the Newfoundland fisheries; a pike; an oscillating lever; a device used in roasting meat.

Jackal, *Canis aureus*, a small wild dog related to the wolf and resembling a fox. The Common

Jackal is found in S.E. Europe, India, and Ceylon; other species inhabit Africa and Egypt. The jackal is a well-known scavenger. It hunts singly or in pairs, unlike the wolf, which usually hunts in packs.

Jackdaw, one of the smaller members of the Crow family. This European bird is typically black with grey collar. It is easily tamed, makes an amusing pet, and delights in making off with and taking to its nest bright objects, such as silverware.

Jacobins, a French revolutionary club or party, formed in 1789, and accustomed to meet at a Jacobin convent, hence the name. It became a controlling force in the Revolution, especially in the movement which led to the Terror. Robespierre was its chief spokesman.

Jacobites, adherents of the Stuart cause after the abdication of James II. First James himself, then his son (the Old Pretender), and later his grandson (the Young Pretender) tried to fan the flame of rebellion in Scotland and Ireland, but after the defeat at Culloden in 1746 the cause was lost. Also the name of the monophysite heretics of Syria (*see* Section J), so named after their leader Jacobus Baradaeus in the 6th cent. A.D.

Jade, a green mineral found in China, America, and New Zealand, and used for making vases, bracelets, and other ornamental articles. There are many varieties, and there is evidence that the stone was in common use in prehistoric times for weapons and utensils.

Jaguar, a South American carnivorous animal resembling the leopard, but much larger and more powerful, the largest of the Felidae.

Janeite, a devotee of Jane Austen and her writings.

Janissaries, an élite band of Turkish foot soldiers who acted as the Sultan's bodyguard, noted for their turbulence and cruelty. They gained great power under the Ottoman Empire. In 1826 the Sultan Mahmud II had them massacred.

January, the first month of the year, named after Janus, the two-faced god of the Romans. It was the *Wolf monath* and *Aefter Yule* of the Saxons.

Jasmine, a graceful climber belonging to the olive family with odoriferous blossom, originally a Persian plant, but now acclimatised in many varieties in almost all parts of the world. Two species of jasmine (the common jasmine and the Spanish jasmine) yield oils used in perfumery.

Jasper, a precious stone of the chalcedony variety, opaque, and coloured red, brown, yellow and sometimes green. It was greatly esteemed by the ancients, the Bible having numerous allusions to it.

Jay, a gaily-coloured bird of the Crow family, of many species—the Blue jay of N. America, the Canada jay, sometimes called "whisky jack," the Siberian jay, and the British jay, fawn-coloured with black and whitish crest and bright blue feathers in the wings. It lives in woods and like the magpie, takes the eggs and young of small nesting birds.

Jazz, a rhythmical syncopated music characterised by a strong element of improvisation in the performance, probably originating among the Negro population of the Southern States of the U.S.A. It became popular during the first world war and, in a commercialised form, has held the popular field ever since. Modern dance music and popular songs are based on the jazz idiom, which has also had a profound effect upon contemporary music of a more serious kind.

Jean, a stout kind of twilled cotton cloth much worn in olden times, and resembling fustian. Blue *jeans*, adopted by American city youngsters from farmworkers, are now the fashion elsewhere and worn not only as overalls by workmen but by both sexes in leisure time.

Jelly-fish. The jelly-fishes, which have gelatinous, translucent bodies fringed at the margin with delicate tentacles, constitute the coelenterate order *Scyphozoa*. The mouth, with a squarish opening, is seen on the underside, and there are four horseshoe-shaped sex organs.

Jerboa, small jumping mammals of the Rodent order. These mice-like animals have long tufted tails and very long hind legs, the front legs not being used for locomotion.

Jeremiad, any utterance or writing in which sorrow or complaint is the chief characteristic, so named as recalling the style of the "Lamentations of Jeremiah," in the Old Testament.

Jerusalem Chamber, a room in Westminster Abbey, deriving its name from the circumstance of its having originally been decorated with a view of Jerusalem. Henry IV. died in this chamber, and the Committee for the Revision of the Bible met there in 1870 and later.

Jesuits, members of the Roman Catholic teaching order founded by Ignatius Loyola in 1534. A long and vigorous course of study is prescribed before they are admitted into the privileges of full membership. They are required to take the vows of voluntary poverty, perfect chastity, perfect obedience, and complete submission to the Pope. The Society played an important part in politics.

Jet, a deep black fossil substance admitting of a high polish and much used for jewellery, ornaments, and trimming. It is a form of lignite, the most important British deposit being found near Whitby, where jet manufacture has been an established industry for a long period.

Jet Engine, an aeroplane engine which derives its thrust from the high velocity of the gases it ejects. The essential units in a jet engine are a rotary compressor and a gas turbine, the latter driving the compressor. The first reliable, high-performance jet propulsion engine for aircraft was invented by Air Commodore Sir Frank Whittle.

Jet Stream, a meteorological term coined in 1946 to describe the relatively narrow belt of strong winds (100–200 m.p.h.) at levels in the atmosphere from 3 to 7 miles. These winds are important in forecasting weather, and can be a valuable aid to aircraft. From the ground, where there may be little wind, the jet stream can sometimes be seen as high cirrus cloud moving across the sky at high speed.

Jewish Calendar is supposed to date from the Creation, which according to their reckoning occurred on Oct. 7, 3761 B.C.

Jew's Harp. The name is believed to be a corruption of "jaws harp." This instrument consists of a metal frame with a central tongue of spring steel. The frame is pressed against the teeth, and the tongue of the harp is twanged with the finger, the mouth acting as a resonating chamber. By altering the shape of the mouth the resonant frequency and therefore the note can be varied.

Jimson Weed, corruption of Jamestown Weed, a synonym for the Thorn Apple of the Nightshade family.

Jockey Club, the governing body that, although possessing no legal status, frames rules and laws by which horse-racing and turf matters generally are regulated. The club-house is at Newmarket.

John Bull, the typical figure of an Englishman, bluff, big, and burly. Arbuthnot's *History of John Bull* is supposed to have originated the character.

John Dory, a well-known sea-fish of which there are six species. It is of a golden-yellow colour (*jaune doré*), has a high dorsal fin with long filaments projecting from the spines, and is much valued as a table fish. It is sometimes found in British waters, but the Mediterranean is its chief habitat.

John o' Groat's House, W. of Duncansby Head, Caithness, popularly named as the northernmost point of Scotland. According to legend the house, which has now disappeared, was built in octagonal form by a Dutchman Jan de Groot who came to live there in the 16th cent. The site is marked and an inn was erected near it in 1876.

Jongleurs were minstrels and jesters who wandered from town to town singing songs, playing musical instruments, dancing, and giving entertainments in mediæval France and Norman England. Jongleurs were low-born in contrast to the Troubadours, who were often of the nobility.

Joule, a unit of energy in the SI system of units, defined as the work done when the point of application of a force of one newton is displaced through a distance of one metre in the direction of the force. Named after J. P. Joule (1818–89). The relationship between mechanical energy and heat energy is called the mechanical equivalent

of heat and was found by Joule to be 778 ft lbf in lb °F units, or 4·18 × 10^7 ergs in gram °C units. *See* F16(2), N13.

Jousts were military tiltings in the nature of tournaments, where the contestants strove against each other on horseback with blunted lances. It was the sport of nobles in feudal times.

Judaism. *See* J24.

Julian Calendar, named after Julius Cæsar, who in 46 B.C., finding the Roman year 90 days in advance of the real time, was the first to adopt the calculation of time by the solar year, the average length being fixed at 365¼ days. There was still an overplus of a few minutes every year, and this was rectified by the Gregorian Calendar, introduced in Italy in 1582 and adopted in England in 1752, from which date what is called the "New Style" begins.

Julus, a genus of millipedes with cylindrical bodies and two pairs of legs to each segment, the latter being 40 to 50 in number. In South America specimens 5 or 6 in. long are frequent, but those found in England are small.

July, the seventh month of the year, named after Julius Caesar. It was the *Maed monath* (Meadmonth) of the Saxons.

June, the sixth month of the year, containing 30 days and deriving its name from Juno. It was the *Sear* (Dry) *monath* of the Saxons.

Jungle-Fowl, birds related to the peacocks and peacock-pheasants. At least four species are known from the jungles of India, Ceylon, and Java. The domestic chicken has been derived from the Red Jungle-Fowl (*Gallus gallus*)

Junkers, name of the ruling class of Prussia, military in spirit, who were the party of reaction and defenders of the landed interests. Supported Bismarck prior to the Franco-Prussian war and helped bring Hitler to power.

Jupiter, the largest planet. It is believed to have a rocky core surrounded by ice layers thousands of miles thick. There is an outer atmosphere containing ammonia and methane, both presumably in the liquid or solid state owing to the very low temperatures of the outer layers (−120° C.). In 1610 Galileo made history by discovering the four major satellites of Jupiter, which he named Medicean planets after his patron Cosimo Medici; these are visible with good field-glasses. There are eight others. For distance of Jupiter, etc., *see* F7. Also the supreme mythical deity of the Romans, identified with the Greek Zeus (H38).

Jurassic Formation, a series of rocks (the evidences of which are most marked in the Jura Mountains) coming between the Cretaceous and Triassic groups and including the Oolite and the Lias. It is a formation rich in fauna, abounding in echinoids, lamellibranchs, ammonites, and belemnites; large reptiles, marine and land, are common, as are the plants called cyads. In Britain the Jurassic outcrop extends from the Dorset coast to the Yorkshire moors. *See* F34.

Jury, a body of private citizens chosen and sworn to hear and pass verdict upon evidence brought forward at a trial, inquest, or inquiry. The origin of the English jury is obscure, but it is thought to have been introduced by the Normans. The jurors are the sole judges of the true facts upon the evidence laid before them. Under the Criminal Justice Act of 1967 their verdicts in criminal courts in England and Wales no longer have to be unanimous but by a majority of 10 to 2. In Scotland 45 jurors are summoned in criminal cases, of whom 15 are chosen by ballot, and majority verdicts are accepted: not guilty, not proven, and guilty.

Jute, the name given to the fibre of a plant grown largely in Pakistan in the Ganges delta and used for the manufacture of coarse cloths, cordage, and packs. Calcutta is the biggest jute-manufacturing centre of the world, as Dundee was in the 19th cent.

Jutes, a Low German race who in the 5th cent. invaded the south-eastern part of England, establishing themselves in Kent and making Canterbury their capital.

Juvenile Courts.—This is a special kind of Magistrates' Court to deal with accused persons under the age of seventeen. The Magistrates chosen are specially qualified for the work, and where possible a woman is appointed as one of the Magistrates who constitute the Court (*see* D44). The Court is held in private away from the ordinary court room. The object of the Juvenile Court is to introduce into the trial a plan to reform the offender by providing for the care and protection which he may need, by removal from undesirable surroundings, and by subsequent education or training. In these objectives the Court has the co-operation of social workers, including Probation Officers (*q.v.*). Radical changes in methods of preventing and treating juvenile delinquency were proposed in a Government White Paper in 1968 called *Children in Trouble*. These proposals emphasised the necessity of helping and supporting the child as far as possible in his own family and community, with resort to formal procedures only where allegations were denied or control was necessary in the interest of society or of the child. The prosecution of children from 10 to 14 would cease; they would be dealt with in the same way as children under 10—by social casework or by care and protection proceedings. Over 14 to 17 there could be (would be in the case of homicide) prosecution, but it would involve an imposed system of co-operation between police, children's officer, probation officer, education authority, and the courts. Detention centres for the under-14s would be abolished.

K

Kagu, native name for a curious bird related to the sun-bittern and the only member of the Rhinochetinae family, found inhabiting New Caledonia when that island was colonised by the French.

Kakapo, the Maori name for the New Zealand owl-parrot, a peculiar and interesting species, possessing wings but not able to use them for flight (though it can glide); of sap-green plumage, nocturnal in its habits, and nesting in burrows. Still to be found in the larger forest areas of the South I.

Kangaroo, pouched (marsupial) mammals of Australia and adjacent islands. There are over 20 species, the smaller ones being known as "wallabies." Kangaroos leap in a succession of springy bounds 10–20 ft. long, the forefeet not touching the ground. They can reach a height of over 6 ft. and a weight of 200 lb. First seen by white men when Capt. Cook's expedition visited Australia in 1770. Related genera include the tree kangaroos, rat kangaroos, and the Tasmanian Jerboa kangaroo.

Kaolin *or* **Kaolinite,** a fine clay much used in the manufacture of high-class pottery. It results from the decomposition of felspar, and is found in China, Japan, Devon, Cornwall, at Limoges in France, and in parts of the United States.

Karst, geological formations typical of limestone regions in which the drainage is by underground channels. Rain water carries part of the limestone away in solution, leaving the surface dry and barren and pitted with innumerable hollows. The name comes from the Karst (Slav *Kras*) region of N.W. Yugoslavia where the rocks are massive pure limestone; the barren plateau is characterised by fissures, caves and subterranean rivers.

Katydid, large long-horned insects of the grasshopper family, common throughout the United States east of the Rockies. Their name comes from the sound these insects make.

Kauri Pine, a large coniferous tree yielding a fine copal resin which ranges from Malay to New Zealand. The New Zealand Kauri, *Agathis australis*, is found only in N. Island. Some of the best Kaur gum comes from fossilised pines and is dug out of the soil far from any living trees.

Kava, a refreshing drink made from the pounded root of the pepper plant (*Piper methysticum*) and the national drink of Tonga.

Keep, the central tower or chief stronghold of an ancient castle, sometimes called the donjon.

Kelvin. Lord Kelvin, an important 19th-cent. physicist, gave his name to the degree Kelvin, written °K. This is a measure of temperature on the absolute scale. *See* **Absolute Temperature.**

Kentish Rag, a fossiliferous clayey limestone of Cretaceous age found in Kent. Used in building.

Keratin, a hard protein material of which horns, nails, claws, hoofs, and reptiles' scales are made.

Kestrel, the most common British falcon, well known for its habit of hovering for minutes at a time with vibrating wings and then swooping down to attack mice and insects. The male has spotted chestnut-brown back, greyish head and tail, which has a broad black band near tip.

Ketones. A class of organic compounds, related to aldehydes, of general formula R_2CO (where R is an organic radical). The simpler ketones, especially acetone, are widely used as solvents for lacquers, synthetic rubber, and polymers, such as cellulose acetate and perspex. More complex ketones occur in nature, and some are used in the perfumery industry, muscone (from the musk deer (*q.v.*)) is an example.

Kew Gardens, officially known as the Royal Botanic Gardens, are among the most celebrated gardens in the world. They were started in 1759 by Princess Augusta of Saxe-Gotha, widow of Frederick, Prince of Wales, and mother of George III. They remained private property until 1841, when control passed to the Commissioners of Woods and Forests. They now cover 300 acres and are administered by the Min. of Agriculture, Fisheries, and Food. Since 1841 the gardens have been open to the public, and form one of the most attractive resorts near London.

Keys, House of, is the Manx representative assembly. *See* **Tynwald.**

Keystone, the stone which occupies the centre and highest point of an arch and is usually the last to be inserted.

Khaki, a clay-coloured cloth adopted for uniforms in the British Army in the time of the war with the Boers, and used in the first and second world wars. First used by Indian regiments.

Kilderkin, once a common liquid measure in England, representing 18 gallons.

Kilogram, unit of mass, defined as the mass of the international prototype kilogram of platinum-iridium kept at the International Bureau of Weights and Measures at Sèvres. A new determination of the imperial standard pound in terms of the international kilogram was made recently by the National Physical Laboratory (1 international pound = 0·45359237 kilogram). *See also* **N12, 13.**

Kilowatt. Unit of power, equal to one thousand watts. *See* **Watt.**

Kinetic Energy, the energy (*q.v.*) possessed by a particle or body in virtue of its motion. If the motion is destroyed, *e.g.*, by the impact of the body with an obstacle, the kinetic energy vanishes, being turned into some other form of energy such as heat and sound. If the body has mass m and speed v its kinetic energy (leaving out corrections due to relativity) is $\frac{1}{2}mv^2$.

Kinetic Sculpture, a development of equipoised sculpture (*i.e.*, sculpture independent of gravity in the sense of resting on a base either horizontally, vertically, or obliquely) intended to appear as "a weightless poising of volumes, relationships, and interpenetrations." Since in the literal sense this is impossible, the Constructivists (Pevsner, Gabo, and Moholy-Nagy) used glass and invisible wire as supports, giving the impression that their creations were in fact independent of gravity. However, the American, Alexander Calder, has made constructions of balls and wire which he calls "mobiles," and in this form they are now known to everyone as they delicately dangle and rotate suspended from the ceiling.

King Crab, remarkable arthropods now classified separately from both Arachnids and Crustacea which they resemble, inhabiting the sea coasts of America, Japan, India, and Malay Peninsula, carrying a shield-shaped shell, and having a long pointed spine projecting from the posterior. The body comprises three separate sections articulated together. These crabs—in America known commonly as the horseshoe crab because of their shape—are from 18 in. to 2 ft. in length. Fossil king-crabs are found as far back as the Silurian. There are about six living species.

Kingfisher, a well-known family of brilliant-plumaged birds, found in all continents, comprising some 250 species and sub-species. The British kingfisher, *Acedo atthis*, haunts the rivers and streams, and is one of the most beautiful of native birds, having iridescent blue-green, white, and rich chestnut in its plumage and bright-red feet. All kingfishers have long, dagger-shaped bills. In the Malayan region, New Guinea, the Moluccas, and Australia the varieties are very numerous. The quaint *Laughing Jackass* of Australia is among the largest of the kingfisher family. The European kingfisher is the bird of the Greek legend of the Halcyon.

King-of-Arms, the name of the chief officials of the Heralds' College. There are several in England —the principal being those of the Garter, Norroy and Ulster, Clarenceux. *See* **Heralds' College.**

Kiosk, a word of Russian or Turkish origin meaning a small open pavilion of light construction much used in Eastern countries as a place of shade and rest. Similar structures are common in the streets of Paris as news and advertisement stands, and in London as telephone offices.

Kirimon (*Kiri no go Mon*) and **Kikumon** (*Kiki no go Mon*), the two Japanese imperial crests, the first a design of leaves, stems, and flowers of the Paulownia plant, and the other representing the sixteen-petalled chrysanthemum.

Kite, name of several birds of prey, widely distributed, related to the hawks and eagles, graceful in flight, and distinguished by their long wings and deeply forked tails. The red kite, light chestnut brown, once the most familiar bird of prey in Britain, seen scavenging the streets of London, is now the rarest, and found only in Wales. The Egyptian kite and the pariah kite of India, notorious for their daring thefts, are closely related to the black kite, a smaller European species, with less forked tail and blackish-brown plumage.

Kittiwake, a beautiful white and pearl-grey gull with black legs, dark eyes, and greenish-yellow bill. Its range is wide, and includes the British Isles, where it is a local resident. The flight of this only truly oceanic gull, which excepting in the breeding-season, is generally found offshore is graceful, swift, and buoyant. A triangular black patch, noticeable on the ends of the wings when open, is characteristic of the species, as is the call kitti-wake, from which the bird derives its name. It nests in colonies on the ledges of caves and steep cliffs.

Kiwi, flightless, stoutly-built birds of New Zealand, now very rare and carefully protected by the Government. They are little larger than a domestic hen, and lay astonishingly large eggs for their size. Incubation and care of chicks fall to the male bird. They have rudimentary wings concealed by the plumage, and the feathers are hair-like. They are nocturnal in habit

Knighthood is a degree of honour or title common in Europe since the Middle Ages, and was at first exclusively a military order. In Great Britain the four main orders of knighthood are those of the Garter, the Bath, the Thistle, and St. Patrick; in addition to which there are several other orders, such as the Order of St. Michael and St. George, the Star of India, etc. There are also Knights Bachelors such as are not associated with any special order. The title is not hereditary, and therefore ranks below that of a baronet, though both are entitled to the prefix "Sir."

Knot, a nautical measure of speed (1 sea mile per hour), and formerly measured by a log-line, divided by knots at equal distances $\frac{1}{120}$ of a geographical mile. The number of knots travelled by the ship in half a minute corresponded to the number of sea miles it travelled per hour. A sea mile is equal to about $1\frac{1}{7}$ of a statute mile. Also, a grey and white wading bird, usually a winter visitor to Britain found in flocks on the coast.

Knout, formerly a Russian instrument of punishment, consisting of a whip of many thongs, used upon Russian criminals since the 15th cent. A hundred and twenty strokes were considered equivalent to a sentence of death, half that number sufficing to kill in many instances. Tsar Nicholas I., however, changed the form of the knout, and made it a much milder instrument.

Koala, the Australian arboreal marsupial mammal that looks like a toy teddy-bear, with ashy-grey fur, bushy ears, and rudimentary tail. It feeds on the leaves and shoots of certain eucalyptus trees, and is not more than 2 ft. in length.

Kohl, a powder prepared from antimony or burnt almond shells, and in common use by the women of the East for darkening the eyelids.

Koto, a musical instrument in general use in Japan consisting of a series of 13 silken strings stretched across a curved wooden surface, and played with the fingers. Each string is 5 ft. long, and has a separate bridge so fixed as to give the vibration necessary for the note it has to produce. It is a sort of horizontal harp, and in the hands of an expert player is capable of giving forth excellent music.

Kremlin, the citadel or walled city within a Russian city which during the Middle Ages served as an administrative and religious centre and offered protection. That of Moscow, now the headquarters of the Russian government, contains the cathedral where the Tsars were crowned, an imperial palace, and the bell-tower of Ivan the Great. Its walls which are topped with towers were built in the 15th cent.

Krypton, one of the rare gases, symbol Kr, occurring in the air to the extent of 1 part in 20 million. It was discovered in 1898 by Ramsay and Travers. It is used in gas-filled electric lamps.

Kusti, the sacred cord or girdle of the Parsees, consisting of 72 threads—the number of the chapters of the Izashue—and two branches, each branch containing six knots, together standing for the 12 months of the year.

Kyrie Eleison ("Lord, have mercy"), the name of a common form of prayer in the Anglican, Roman Catholic, and Greek Churches; also applied to the English Church responses after the recital of the commandments.

Kyrie Society, named after Pope's "Man of Ross," John Kyrle, founded by Miss Miranda and Miss Octavia Hill in 1875, and having for its object, the decoration of workmen's clubs, hospitals, etc. and the promotion among the poor of a taste for literature, music, and outdoor recreation.

L

Labarum, the standard of Constantine the Great, adopted after his conversion to Christianity, marked with his seal, and represented upon the coinage.

Labourers, English Statute of, was passed 1850–51, with the object of compelling labourers to accept a certain rate of wages and not leave their employers' service, the Plague having rendered labourers so scarce that they were in great demand and had been insisting on higher pay. These enactments were bitterly opposed and led to the "Peasants' Revolt," headed by Wat Tyler.

Labradorite, a felspar rich in calcium and of a pearly lustre on cleavage, found in masses in igneous rocks, the best samples of which come from Labrador.

Labyrinth, or **Maze**, a combination of roads and passages so constructed as to render it difficult for anyone ignorant of the clue to trace the way to the central part. The Egyptian labyrinth near Lake Moeris had 3,000 rooms, half of them subterranean and the remainder above ground. The labyrinth in Crete, according to Greek myth, was built by Daedalus to house the Minotaur. There was one at Lemnos, renowned for its stalactite columns; and another at Clusium constructed by Porsenna, King of Etruria, about 520 B.C. The labyrinth in which Fair Rosamond was concealed was at Woodstock. Hampton Court maze dates from the 16th cent.

Labyrinthodonts, gigantic fossil amphibians which get their name from the curious labyrinthine structure of their teeth, probably an evolutionary link between fishes and reptiles. They occur in the Carboniferous, Permian, and Triassic formations, and remains have been found in Britain and other parts of Europe. Their heads were several feet long, and their footprints, by which they were discovered, closely resemble the prints of the human hand.

Lac, a resinous matter deposited on the branches of a number of tropical trees by the females of the lac insect, the exudation including eggs and a viscous covering. At the gathering time the twigs are broken off and dried in the sun, when the insects die, and the lac that remains is termed *stick-lac*. From this, by the remova of extraneous accretions and dissolving, *seed-lac* is produced. *Shell-lac* is seed-lac after it has been melted and otherwise prepared, and this is the best known of the lacs, being used in printing and the manufacture of varnishes and sealing-wax, and for other commercial purposes.

Lace, a delicate fabric of linen, silk, or cotton threads, made by hand or machinery, and worked in various ornamental designs. The kinds of lace are many, deriving their distinctive names either from the method employed in production or from the place where any special variety was originally made. The best-known makes are pillow or bobbin-lace, woven and plaited by hand; needle-point lace, worked by the needle over a traced design; and machine lace, which practically dates from Heathcote's invention of the early part of the 19th cent. Some of the most famed laces are the following: *Alencon*, a needle-point lace; *Brussels*, a very fine kind, with needle-point sprigs and flowers; *Chantilly*, a silk variety with flowers and openwork; *Cluny*, a netlace with darned stitch; *Honiton*, a delicate kind with dainty sprigs and figures; *Mechlin*, generally made in one piece and very varied in design; and *Valenciennes*, or bobbin lace, of great durability, the pattern and ground of which are made at the same time, being one of the best and most costly of laces, now manufactured mainly in Belgium. Nottingham is famous for its lace.

Lace-Wings, insects with frail, transparent, and much-veined wings whose grubs eat large numbers of insect pests such as aphids. The eggs are borne at the ends of threads attached to plants.

Lachesis, a genus of venomous snakes of the rattle-snake family confined to tropical countries, and including the "deadly bushmaster," of Surinam, and several Crotalidae pit-vipers of Guiana and Brazil.

Lacquer, a varnish made from shellac and certain colouring matters, and utilised for imparting lustre to various surfaces of metal or wood. In China and Japan the production of lacquer ware of a decorative character has long been an important industry, bringing into use gold, coral, vermilion, sprinkled, and other lacquers, with pleasing effect.

Ladybird, the common name of a large family of beetles—the *Coccinellidae*. The insect is usually of a red or yellow colour with small black or coloured spots. Ladybirds are of good service to the gardener because their larvae feed on aphids. There are about 2,000 species.

Lady-Day, the day of the festival of the Annunciation of the Virgin Mary, Mar. 25. One of the four English quarter days.

Lagoon, a stretch of shallow water opening out upon the sea. Venice is built on lagoons.

Lake Dwelling, the name given to certain prehistoric habitations which were thought to have stood on platforms over lakes, like villages in certain Pacific islands. Recent excavations at the Lake of Burgäschi in Switzerland show that the prehistoric Swiss pile dwellings probably stood on the shores of lakes, not on platforms over the water.

Lakes are bodies of water collected in depressions of the earth's surface. The most notable lakes are the Great Lake series of North America, including Superior, Michigan, Huron, Erie, and Ontario, all discharging into the St. Lawrence River. Africa has an enormous area of lakes, including the Albert Nyanza and the Victoria Nyanza, forming the sources of the White Nile, Lakes Tanganyika, Nyassa, Tchad, etc. Smaller lakes are numerous in other countries—Switzerland, Germany, Italy, England, Ireland, Scotland, all having their lake regions, where the scenery is invariably beautiful and romantic.

Lake School, the name given, at first in ridicule, to a distinguished trio of poets—Wordsworth, Coleridge, and Southey—who made their homes in the English Lake District.

Lamellibranchs (Pelecypods), the class of aquatic, bi-valve molluscs to which the oysters, cockles, mussels, clams, and scallops belong. In these animals the body, which is compressed laterally, is enclosed in two hinged shells held together by muscular action. The gills are thin plates hence the name "lamellibranch." *See* F28(1), 31(2).

Lamination, stratification on a very fine scale, as in shales.

Lammas Day is one of the oldest of the Church festivals, probably derived from the loaf-mass (hlafmæsse) of the Anglo-Saxons. It occurs on August 1. In the olden times it was the day when loaves were given in place of first-fruit offerings.

Lammergeyer, the bearded vulture of alpine regions, resembling an eagle in appearance. It has a white head with black tufts at base of the bill, and its general plumage is dark brown, nearly black. It is found in the remote mountain ranges from Southern Spain to China, and is becoming scarce.

Lampblack, a carboniferous pigment obtained from flame-smoke, and now produced in specially constructed furnaces in which bodies rich in carbon, such as tar, resin, petroleum, etc., are burned. The smoke or soot resulting is collected from the sides of the furnace, and forms lampblack. It finds use in making printer's ink, black paint, etc. Being a very pure form of carbon, it is also utilised in the manufacture of dynamo brushes and arc-lamp carbons.

Lamprey. Eel-like fish having no scales, bones, paired fins, or jaws. They attach themselves by their mouths to fish whose blood they suck. Together with the hagfishes, the lampreys are placed in a special class—the Cyclostomes. There are three British lampreys.

Lancelet. *See* Amphioxus.

"Lancet," the name of a noted English medical journal, established in 1823 by Dr. Wakley.

Land Crab, a family of crabs (*Gecarcinidae*) which live mainly on land, though migrating to the sea to deposit their eggs.

Land League, an association formed in 1879, with Parnell as president, for compelling a reduction in the rents of land, and a reconstruction of the land laws in Ireland, and in case of non-compliance refusing to pay rent. For a time this League exercisedgreat political influence and was an important aid to the Home Rule agitation.

Landrail, popularly known as the Corncrake, was a regular summer visitor to Britain two generations ago, but no longer. Its harsh and piercing note was a familiar sound in English cornfields. Still found in Ireland.

Landslip, a sudden downward sliding under gravity of large masses of rock, soil, etc.; often set off by earthquake shock or saturation of a particular stratum with water. Many serious landslides have occurred from time to time. In 1618, an earthfall happened at Plurs, on Lake Como, involving the destruction of many buildings and the loss of numerous lives. In 1806 a portion of Rossberg mountain in Switzerland slipped from its position, and falling into the valley below buried many villages and hamlets and over 800 people. A chalk cliff from 100 to 150 ft. high and three-quarters of a mile long fell at Lyme Regis, in Dorsetshire, in 1839, doing great damage. Over 200 people were killed by a landslip in Naini Tal, in India, in 1880; and at Quebec, in 1889, a rocky eminence called Cape Diamond gave way, many buildings being destroyed and lives lost. Notable landslips in recent times have occurred at Amalfi (Italy) in 1924, and at Murchiston (New Zealand) in 1929.

Langue d'oc and Langue d'oïl, the two principal mediæval French dialects, *oc* and *oïl* being their respective words for the affirmative particle (modern French *oui*). *Langue d'oc*, spoken south of the Loire, was the language of the troubadours. Provençal, one of its dialects had a literary revival in the 19th cent. under the influence of the poet Fréderic Mistral. *Langue d'oïl* was spoken in northern France, and it was the dialect of the Paris region which developed into modern French.

Lantern Fly, bugs belonging to the family *Fulgoridae* in which the head is drawn out to form a lantern-like structure. In no instance is the "lantern" luminous, though naturalists used to think it was.

"Lantern of England." Bath Abbey possesses so many windows that it is called sometimes the "Lantern of England." Among numerous interesting monuments Bath Abbey contains that of Malthus, author of *Essay on Population*.

Lanthanum, a metal belonging to the rare earth group of metals, discovered by Mosander in 1839.

Lapis Lazuli, an azure-blue mineral, being a silicate of aluminium and sodium. The pigment ultramarine is made by grinding it, though artificial ultramarine has largely superseded it. The mineral (also called *lazurite*) has been used as a gemstone since ancient times.

Lapwing *or* **Green Plover**, familiar British bird on moors and marshlands with iridescent greenish-black plumage, white underparts, and black crest. Often called "peewit" from its cry. Protected under Protection of Birds Act, 1967.

Larboard is the old nautical term indicating the left-hand side of a ship, and changed by Admiralty order to "port" in 1844. Starboard is the right-hand side.

Larch, a familiar coniferous tree in the mountain regions of northern Europe, and though not native to Britain, the Common Larch is successfully cultivated in various parts of the kingdom. It is one of the best of all turpentine-yielding trees, and the bark is valued for tanning. The larch is an unusual conifer in being deciduous.

Larid, a bird of the *Laridae* or gull family.

Lark, a family of song birds (*Alaudidae*) of many species, some of which—notably the skylark—are famed for their habit of soaring into the air, singing all the while. They build their nests on the ground in the open country and, except for the black lark of Russia, have streaked brown plumage. The skylark and woodlark are the best known British species, while the crested lark and shore lark are among the occasional visitors. Africa has the greatest number of larks: America has only one species, the horned lark.

Larkspur, the common name of the genus *Delphinium*, a favourite flower introduced into British gardens from Switzerland in 1573. The common larkspur is *D. consolida*.

Larva, the undeveloped form of any animal which, before maturity, undergoes metamorphosis, usually different from the adult in structure and habits.

Laser. A remarkable kind of light source that was discovered in 1960. With the laser it is possible to probe the behaviour of matter under the influence of enormous energy densities, range and survey vast distances to microscopic accuracy, and send millions of telephone and television messages between any two points that can see each other with telescopes. Laser light, in contrast to natural light, is coherent and can be expressed as a regular progression of waves carrying energy along a particular path. Thus the essential difference is that laser light is an orderly sort of wave motion in contrast to ordinary light which is inherently unsteady and therefore an inefficient carrier of information in time. The name *maser*, which is the microwave parent of the laser, derives from the expression "*m*icrowave *a*mplification by the *s*timulated *e*mission of *r*adiation." Upon application to light wavelengths the microwave part of the name lost its meaning and the term maser became generally descriptive of any device in which stimulated emission dominates.

Latent Heat is the quantity of heat required to convert 1 gram of a substance from one form into another. For example, when a solid changes into a liquid or a liquid into a gas, the addition of heat to bring about the change produces no rise in temperature, the energy being absorbed in the form of latent heat. An equal amount is released when the process is reversed. The latent heat of fusion of ice is about 79·6 calories per gram, that of the vaporisation of water about 539 calories per gram.

Lateran Councils were the religious conventions held in the Lateran basilica at Rome for deciding important questions of Church doctrine. The most brilliant was that of 1215, which pronounced in favour of a Crusade. *See* Ecumenical Councils.

Laterite, a residual deposit formed in the tropics by weathering and decomposition of igneous rocks. It consists mainly of hydrated ferric and aluminium oxides and is difficult to cultivate.

Latin America. The Spanish-speaking, Portuguese-speaking, and French-speaking countries of N. America, S. America, Central America, and the W. Indies. *See* K98.

Latitude of a point on the earth's surface is its

angular distance from the equator, measured on the surface of the earth in degrees, minutes, and seconds. Thus the equator is 0° Lat. and the poles 90° Lat. (N. or S.). First determined by Hipparchus of Nicaea about 160 B.C.

Laughing Gas. *See* **Nitrous oxide.**

Launce *or* **Sand Eel**, a family of eel-like sea fishes found in large numbers on the coasts of North America and Europe. There are two species common to British waters. These fishes are of a bright silvery hue, and live much in the sand underneath the water. They are prized as bait.

Laurentian Shield refers to the Pre-Cambrian rocks in the region of the Upper Lakes of Canada, nearly 2 million sq. m. in extent. Of enormous importance to Canada on account of the mineral wealth, forests yielding valuable timber and wood-pulp, and water-power.

Lava, the molten rock which is erupted from a volcanic vent or fissure. Also the same material which has cooled and solidified.

Lawn, very fine sun-bleached linen, in olden time called "cloth of Rheims."

Lead, a soft malleable metal, symbol Pb (Latin *plumbum*), occurring in numerous ores, which are easily smelted. Its most important source is the mineral galena which consists chiefly of lead sulphide; rarely is it found free. Lead is largely used in plumbing on account of its pliability, and in nuclear reactors as a shield against radiation because of its very high density. As an alloy element it combines in the formation of type metal, stereo metal, shot metal, pewter, and many other compounds. Oxides of lead are used in some types of glass and in the manufacture of paints (red lead). All lead compounds are poisonous. Leading producers of lead are the United States (Missouri), Australia (Broken Hill) and the Soviet Union.

Leaf Insect, a group of insects related to the locusts, grasshoppers and stick insects which in colour and form closely resemble leaves.

Leaf Miners, insect larvae which tunnel between the upper and lower skins of leaves. Most leaf miners are caterpillars of tiny moths; some sawfly larvæ have the same habit.

Leagues, or combinations of kings, countries, communities, have been frequent since the kings of Canaan united against the Israelites. Among the most famous leagues may be mentioned the Holy or Catholic League, which prevented the accession of Henry IV. of France until he became a Roman Catholic; and the League of Augsburg against Louis XIV. of France in 1686.

League of Nations, was founded on Jan. 10, 1920, with the object of promoting international peace and security. The original members were the signatories to the Peace Treaties at Versailles, and membership grew to fifty-three as new nations and ex-enemy States were admitted. Two notable absentees were the United States and Soviet Russia, the latter not being represented until 1934. Germany was a member from 1926 to 1933. The League had an Assembly which met at Geneva every year and a Council which met five or six times a year. The Permanent Court of International Justice sits at The Hague. The final Assembly of the League was held at Geneva between April 8 and 18, 1946. Its place has been taken by the United Nations. The International Labour Organisation, set up by the League of Nations met on April 20, 1944, at Philadelphia and resumed its old quarters at Geneva under the new organisation in 1946.

Leap Year *or* **Bissextile**, was fixed by Julius Cæsar, 45 B.C., the addition of one day in every four years bringing the measure of the calendar year even with the astronomical year with three minutes per year over. The Gregorian Calendar corrected this by dropping leap year at the centuries not divisible by 400. For instance, 1700, 1800, and 1900 were not leap years.

Learning.—*See* **F31(1).**

Leather was made in ancient Egypt, Greece, and Rome, and has through succeeding centuries played an important part in the service of man. It consists of the dressed hides or skins of animals after the process of tanning has been gone through Untanned skins are known as pelts. Leather is classed either according to the skins from which it is made or the system of preparation employed. The best-known kinds are morocco, kin, Russian, chamois, Cordovan, grained, patent, russet, tan, calf, Hungarian.

Leech, an aquatic blood-sucking worm, mostly found in fresh-water ponds. Each end of the body is provided with a sucker, but that at the head end has jaws and teeth. The medicinal leech has three jaws. The leech attaches itself with avidity to animal bodies and sucks until glutted. Its saliva contains an anti-coagulant.

Leeward, a nautical term, meaning the sheltered side of a vessel—that is, the opposite side to that from which the wind is blowing.

Legion, a body of Roman troops, varying in numbers at different periods. A legion was divided into 10 cohorts, and every cohort into three maniples. Three legions composed the Roman army of occupation in Britain.

Legion of Honour, the French order for distinguished services, military or civil, was instituted by Napoleon I. in 1802, and confirmed and modified under later rules. There are five grades—Grands Croix, Grands Officiers, Commandeurs, Officiers, and Chevaliers.

Legume, the fruit typical of the pea, bean family, or *Leguminosae*.

Lemming, small light-brown rodents with dark spots, abounding in Scandinavian countries and in Siberia, about 5 in. long, with a short stump of a tail. The migrations of the lemming are famous, probably caused by overbreeding when food is plentiful. So insistent is the urge to keep moving that these animals will march on into the sea in their thousands and be drowned.

Lemur, the most primitive member of the Primate order of mammals (to which man, apes, and monkeys also belong). They are noted for having strong pliant toes enabling them to use their feet as hands, and also well-developed thumbs on the hands. They have long squirrel-like tails, fox-shaped heads, and large staring eyes, and are distributed over the tropical parts of the Old World, being most abundant in Madagascar.

Lend-Lease. During the earlier phases of the Second World War the bulk of British investments in the U.S.A. had to be either sold or pledged to Americans in payment for dollar supplies. After the United States entered the war this drain was stopped by the Lease-Lend arrangement, under which Great Britain met the costs of American consumption in Great Britain, while the United States paid for British supplies from America. This arrangement was abruptly terminated on the ending of hostilities; and Great Britain and other belligerent countries found themselves without means of paying in dollars for indispensable American supplies, including the foodstuffs, materials and capital goods needed for economic reconstruction. In these circumstances Great Britain negotiated with the United States and also with Canada a large loan, which was used for buying dollar supplies and played an important part in helping the West European economies to maintain themselves and feed their peoples while they were carrying through the earlier stages of post-war reconstruction. These loans involved large charges for interest and amortisation in future years, but proved far too small to meet the dollar deficit for more than a short period. In face of this situation the United States launched the Marshall Plan (*q.v.*).

Lenses, pieces of transparent material designed to focus an image of an illuminated object. Usually of glass, but plastic lenses are common, and quartz, etc. are used for special purposes. The surfaces of the simplest lenses are parts of spheres. Lenses which are thickest, or thinnest, at the centre are called convex and concave respectively. Lenses of complex shape are often used in microscopes, etc. Electron lenses are arrangements of electric or magnetic fields which focus beams of electrons, *e.g.*, on to television screens.

Lent, the forty days' period of fasting that precedes Easter.

Lepidoptera, the order of insects with scaly wings and bodies, to which the 90,000 butterflies and moths belong.

Leptons. A group of particles which includes

electrons, nuetrinos and muons. All are much lighter than protons or any of the baryons. *See* F14.

Lepus, the constellation of the Hare, situated under the Orion group, and one of the constellations with which the ancients were familiar.

Lettres de Cachet, sealed letters which the kings of France issued to their agents to secure the imprisonment of distrusted or disliked persons without trial. Abolished in 1789.

Levée, a State reception held by the Sovereign or his representative and attended by men only.

Lever, a rigid bar of metal or wood used for raising heavy bodies, and worked by means of a support called the fulcrum placed underneath the lever.

Lewis, a contrivance for stone-lifting, the principle of which was known to the ancient Romans; it consists of two dovetail tenons of iron or other metal, expanded by an intervening key in a dovetail-shaped mortice in the stone, and shackled by a ringed bolt to the hoisting chain.

Leyden Jar, the earliest form of electrical condenser. Its invention is usually credited to Muschenbroeck of Leyden (1745). It consisted of a jar coated inside and out with tinfoil for about two-thirds of its height and having its inner coating connected with the top by a brass knob and chain. The jar was charged by connecting it to an electrostatic machine.

Lias, a geological term referring to the lower section of the Jurassic group, and mainly comprising shales and limestones.

Liberalism. *See* J25.

Libraries, before the invention of printing, were few, and collected together at enormous cost. At Nineveh remains of libraries, consisting of tablets of baked clay, have been discovered. There were two libraries at Alexandria containing a vast collection of rolls or volumes, founded by Ptolemy I Soter (367–283 B.C.) and established by Ptolemy II Philadelphus (309–246 B.C.). Among the great libraries of later times may be mentioned the Vatican Library at Rome, moved to its present premises in 1588; the Royal Library in Paris which later became the Bibliothèque Nationale; The Astor Library, New York; and in England, the Bodleian Library, Oxford, and the British Museum Library at Bloomsbury. Since 1850 public libraries have been established in all the chief cities and towns of the kingdom. The first lending library was opened in Edinburgh in 1726. In most villages there is a "county library centre" to which collections of books are sent by the County Library. In Great Britain there are 24,000 centres of this kind in village clubs, halls, shops, schools, and even homes. In some counties there is a library van or the bibliobus, as it has been called by a French writer. This travelling library tours on a pre-arranged time-table so that everyone knows exactly when it will arrive. The British Museum Library in London, the National Library of Scotland, in Edinburgh, that of Wales in Aberystwyth, the Bodleian Library of Oxford and the Cambridge University Library comprise the "copyright" libraries, entitled to receive a copy of each new book published in Britain. Other national libraries are the National Lending Library for Science and Technology, under the Department of Education and Science, at Boston Spa, Yorkshire, and the National Central Library, which is responsible for interlending at national and international level. Four of the best special libraries in the world are open to the public in London. They are:

1. The Library of the Natural History Museum (for zoology, geology, and related subjects).
2. The Library of the Science Museum (all branches of science and technology, except medicine).
3. The Patent Office Library.
4. The Library of the Victoria and Albert Museum which is the national art library containing volumes and photographs on all aspects of fine, applied, and decorative art.

Full details of the large number of specialist libraries in London (including that of the British Library of Political and Economic Science, one of the best collections in the world on this subject, at the London School of Economics) will be found in *The Student's Guide to the Libraries of London*, by R. A. Rye, published by the University of London Press and *The Libraries of Greater London*, by L. M. Harrod, published by G. Bell. *See also* British Museum, India Office Library.

Libration, an astronomical term referring to an apparent irregularity in the moon's course, which may be libration in longitude or latitude, or diurnal, and due to a variety of causes.

Lichens. In every lichen, two plants are associated, one being an alga and the other a fungus. The fungus derives its food from the alga; probably the alga gains too from the association, being protected against desiccation by the fungus (an example of symbiosis). Lichens are the first plants to colonise bare rocks.

Life-Boat was invented by three men, Lionel Lukin who converted a coble into a boat for saving life in 1785; William Wouldhave, who discovered how to make a boat right herself if she capsized, and Henry Greathead, who built a life-boat, partly from Wouldhave's model, in 1789. This boat was stationed at South Shields, which was the first permanent life-boat station to be established. It was not until 1851 that the first life-boat able to self-right was built, and a motor was first installed in a life-boat in 1904. Modern motor life-boats have engines of from twin-18 h.p. to twin-80 h.p., with a speed of nearly 10 knots. All coastal life-boats in this country are maintained by the Royal National Lifeboat Institution founded by Sir William Hillary in 1824.

Light, a particular kind of electromagnetic disturbance capable of travelling through space, and some kinds of matter, and of affecting our eyes to cause vision. Its finite speed was first demonstrated by O. Römer, using observations of the eclipses of Jupiter's satellites in 1675. In 1860 Maxwell showed that light waves are electromagnetic. Since Einstein's theory of relativity (1905) it has been generally realised that the speed of light is a fundamental natural constant. Visible light with wavelengths between about 4 and 6 $\times$ 10^{-5} cm. is only a small part of the electromagnetic spectrum. Subtle modern methods give the speed as 2·997930 $\times$ 10^{10} cm. per sec. (about 186,000 miles per sec.).

Light Year. A measure of astronomical distance, equal to the distance light travels in the course of a year. A light year is thus 5·88 million million miles. *See also* F8(2).

Lighthouses, to warn ships of dangerous places and indicate coasts, points, harbours, etc., have existed since the building of the Pharos, a tower of white marble 600 ft. high, built by Ptolemy II Philadelphus at Alexandria about 280 B.C. In early lighthouses the lights were simple fires. The most famous and one of the earliest British lighthouses is the Eddystone (*q.v.*). Dungeness lighthouse, opened in 1960, is very modern in design, capable of automatic operation and the first of its kind to incorporate the xenon electric arc lamp as a source of illumination. The electric fog signal consists of sixty loud-speaker units built into the tower just below the lantern, giving a honeycomb effect. The lighthouses of England and Wales, the Channel Islands, and Gibraltar are under the control of Trinity House; Commissioners of Northern Lighthouses control those of Scotland; and the Commissioners of Irish Lights control the coasts of Ireland. Particulars of lights in all parts of the world are published for the guidance of navigation in the *Admiralty Lists of Lights*, compiled annually by the British Admiralty.

Lightning, the flash of a discharge of electricity between two clouds, or between a cloud and the earth, when the strength of the electric fields becomes so great as to break down the resistance of the intervening air With "forked" lightning the actual path, often branched, is visible, while with "sheet" lightning the flash is hidden by the clouds which themselves are illuminated. "Ball" lightning or fireballs is the name given to the luminous balls which have been seen floating in the air during a thunderstorm. The Boys camera has provided much information regarding the sequence of events in a lightning discharge. It is found that a flash

consists of a number of separate strokes, usually four or five, and that the discharge of electricity to earth begins with a faintly luminous "leader" moving downwards and branching at intervals. As the ground is approached a much brighter luminosity travels back along the conducting channels, lighting up the several branches. The multiple strokes which follow in fractions of a second have the same "return" nature and are rarely branched. Lightning flashes to earth damage structures, cause loss of life and endanger overhead power systems, often interrupting electricity supply. Such storms generally affect radio transmissions and present hazards to aircraft. Thunder-clouds may develop energy far exceeding the capacity of our largest power generating stations.

Lightning Conductor, a metal rod, the upper part of which is of copper with a conical point, the lower portion being iron, which extends into the earth. Its effect is to gather to itself the surrounding electricity and discharge it into the earth, thus preventing its falling upon the protected building. In ships, lightning conductors are fixed to the masts and carried down through the ship's keel-sheathing. Benjamin Franklin was the first to realise the possibilities of lightning protection and, in 1752, carried out his famous experiment of drawing electricity from thunder-clouds, with the aid of a sharp-pointed conductor fixed to a kite.

Lillibulero, an old marching song composed by Purcell. With words by Wharton, it is said to have "sung James II. out of three kingdoms." During the second world war it was used by the B.B.C. as a station identification signal preceding news bulletins.

Lily Family (Liliaceae), one of the largest families of flowering plants, with 200 genera and 2,500 species. It includes the true lilies (*Lilium*), tulips and hyacinths. Useful vegetables belonging to the family are the onion and asparagus.

Limes, trees of the genus *Tilia*, including some 30 species spread over north temperate regions. The word is a corruption of "linden." Limes native to Britain are the small-leaved *T. cordata* and the broad-leaved *T. platyphyllos*. The hybrid *T. vulgaris* was introduced into Britain from the Continent during the 17th cent. and is frequently seen in streets and parks. Lime-wood was used by Grinling Gibbons for his fruit, flower, and bird decorations.

Limestone is carbonate of calcium. It is found in every geological formation, and is often highly fossiliferous. Marble is limestone that will polish after cutting.

Linen, a textile fabric manufactured from flax fibre, known to the ancient Egyptians, and first manufactured in England under Henry III. by Flemish weavers. The chief seat of the manufacture is Ulster, with Belfast as the centre. Dunfermline (famous for its damasks) and Manchester are also large linen-producing towns.

Ling, a sea-fish common on the coasts of Britain, and abounding in more northern waters. It averages from 3 to 4 ft. in length, and is a voracious feeder, living chiefly on small fish. Ling is also the name applied to *Calluna vulgaris*, the plant which most people called "heather."

Linguistics. *See* M28(1).

Linseed, the seed of the flax plant, containing, apart from its fibrous substance, certain oily and nitrogenous matter of considerable commercial value. This yields linseed oil, and some of the residue is used to make cattle food.

Lion, the most impressive of the Cat family (*Felis leo* or genus *Panthera*). It is chiefly found in open bush country in Africa, being comparatively rare in Asia. Its large square head, its flowing mane (in the males only), and its tufted tail distinguish it. From tip to tip it can reach a length of 10 ft.; a weight of 500 lb. Only weak, old lions are liable to attack man, usually they avoid him.

Lion and Unicorn, the supporting figures of the royal arms of Great Britain, date from the union of Scotland with England at the accession of James I. (James VI. of Scotland), the lion representing England and the unicorn Scotland.

Liqueurs are essences combined with alcoholic liquid, and are of many kinds, named according to their flavourings or place of production, and include Maraschino, Chartreuse, Curacoa, Benedictine, Noyau, Kümmel, etc.

Liquid, the name given to matter in such state that it takes its shape from the containing vessel. The volume it occupies is independent of the container, however. *See* F17(1).

Litanies were first used in church processions in the 5th cent. The first English litany was commanded to be recited in the Reformed churches by Henry VIII. in 1544.

Lithium, a soft metallic element, symbol Li, similar to sodium. It is very reactive and is stored under paraffin oil. It is the lightest metal element.

Lithography, the art of drawing on stone and printing therefrom, was discovered by Alois Senefelder about 1796, and was introduced into England a few years later. Many improvements in the art have been made in recent years, especially in chromo-lithography and photo-lithography.

Litre, a metric measure, was abolished in 1964 as a scientific unit of volume, but remains as an everyday unit, *e.g.*, of wine in countries that use the metric system for everyday purposes.

Liturgy, the name given to the Church ritual, though strictly applying only to the portion used in the celebration of the Eucharist or Lord's Supper. The Anglican liturgy is laid down in the Book of Common Prayer (1662). Parliament gave its consent in 1965 for changes in the form of worship.

Liverworts (Hepatics), a class of simple green plants related to the mosses. There is no differentiation into stem and leaves. Liverworts are most common in damp situations, such as the banks of ditches.

Lizard, the name given to a diversified order of reptiles, of which there are about 1,600 species. Included among the lizards are the geckos, chameleons, glass snakes, skinks, and blind worms.

Llama, mammals related to the camels, from which they differ in small size, absence of humps, and more woolly coat. The domestic llama of S. America is used as a beast of burden, also providing wool, meat, and milk. *See also* Alpaca, Guanaco.

Loadstone *or* **Lodestone**, an oxide of iron, found chiefly in Sweden and Norway. Its scientific name is magnetite. It has the power of attracting pieces of iron and served as the first magnets used in compasses. One of the class of non-metallic magnetic materials nowadays known as "ferrites."

Lobby Correspondents are political correspondents of newspapers who do not report the actual proceedings of Parliament—this is done by Parliamentary Correspondents—but interpret political news and events.

Lobsters are marine crustacean animals existing in large numbers in the northern seas of Europe and America, and in fair proportion on some parts of the British coasts, especially in the neighbourhood of the Channel Islands.

Locarno, Treaty of, 1925, whereby Germany, France, and Belgium undertook to maintain their present frontiers and to abstain from the use of force against each other. Hitler broke the pact by re-occupying the Rhineland, the demilitarisation of which had been recognised by Germany.

Locust, insects of the grasshopper family, but much more powerful. They are inhabitants of hot countries, and often make their appearance in untold millions, like clouds, devastating all the vegetation that comes within their course. The locust-tree (*Ceratonia siliqua*) is supposed to have furnished food to St. John the Baptist in the wilderness, and its "beans" have accordingly been styled "St. John's Bread."

Loess, a deposit of silt or marl laid down by wind action. The biggest loess deposits are in Asia, the source of the dust of which they are composed probably being the deserts of Central Asia.

Log, a line used for reckoning the speed at which a ship is travelling. It was first used in the 16th cent. The line is divided into spaces of 50 ft. marked off by knots and measured by a half-minute sand glass, bearing the same proportion to an hour as 50 ft. bear to a mile.

Logarithms, a system of calculation invented by John Napier in 1614, and developed by Henry Briggs a few years later. Thus if a

number is expressed as the power of another number, *i.e.*, if $a = b^n$, then n is said to be the logarithm of a to base b, written $\log_b a$. Common logs are to base 10 and Napierian to base 2·7182818. . . ., expressed as e. Their use represents a great saving of time.

Logical Positivism. *See* J25.

Lollards. *See* J25.

Lombards, a German people, originating on the Elbe, who settled in Italy in the 6th cent., occupying northern and central regions, and establishing a kingdom with Pavia as capital. They were conquered by Charlemagne in 774, but left their name to the region of Lombardy. Lombard Street, London, takes its name from the Lombard merchants and bankers who came to settle there in the 12th cent.

London Clay, geological stratum which occupies much of the London Basin and part of the Hampshire Basin. It represents the lower stratum of the Eocene. Outside the metropolis, brickfields utilise the clay for brickmaking. Water held above this impervious stratum is tapped by a number of artesian wells in London. The tunnels of the Capital's underground railways run through the London Clay.

London University comprises nearly one-third of the academic activity of the United Kingdom, and is recognised as one of the great universities of the world. Originated in the foundation of a non-sectarian college in Gower Street in 1828. Among the chief colleges are: University, Kings, Imperial College of Science and Technology, London School of Economics, School of Oriental and African Studies, Queen Mary, Birkbeck, Royal Holloway, Bedford, Westfield, and Queen Elizabeth College. London University was the first to throw open all degrees to women (1878).

Long Distance Routes. The National Parks and Access to the Countryside Act 1949 provided for the establishment in England and Wales of Long Distance Footpaths and Bridleways. The following have been approved but only the Pennine Way has been completed: Pennine Way (a magnificent hill walk of 250 miles from Edale in Derbyshire along the Pennines over the Cheviots to the Scottish border); Pembrokeshire Coast Path; Offa's Dyke Path (168 miles along the marches of Wales); South Downs Way (Beachy Head to Salisbury); South-West Peninsula Coast Path (North Cornwall, South Cornwall, South Devon, Somerset and North Devon, Dorset); Yorkshire Coast and North York Moors. *See also* National Parks.

Longitude of a point on the earth's surface is the angle which the meridian through the poles and that point makes with some standard meridian. The meridian through Greenwich is usually accepted as the standard meridian and the longitude is measured east or west of that line. As the earth revolves through 360° in 24 hrs., 15° longitude represent 1 hour's difference in apparent time.

Long Parliament (1640–60), marked the end of Charles I's 11-year attempt to govern without parliament. It carried through what has come to be called "the English Revolution" and was the parliament of the civil war (1642–49).

Lord Lieutenant is the Queen's representative in the county, and his office is now largely ceremonial. On his recommendation the magistrates or Justices of the Peace are appointed by the Lord Chancellor. The office was created in 1549 to take over the military duties of the sheriff.

Lords, House of, the Upper House of the British Parliament composed of Lords Spiritual and Lords Temporal. The former consist of the two Archbishops and twenty-four English Bishops and the latter of Peers and Peeresses. The full membership is about 900. The right of the Lords to veto Bills passed by the Commons is restricted by the Parliament Acts of 1911 and 1949. The Lord High Chancellor presides over the House of Lords. *See* Section C, Part II.

Louse, parasitic insect found on the skin of birds and mammals. The bird or biting lice belong to the order *Mallophaga*; the true or sucking lice to the order *Anoplura*. Two species of lice parasitise man, and one of these, the body louse, is a carrier of typhus.

Louvre, one of the old royal palaces of Paris, was built in its present form partly by Francis I, and added to by later monarchs, Louis XIV, completing the edifice. Napoleon I. turned it into a museum and enriched it with the plunder of many foreign art galleries. The great extension to the Louvre building begun by Napoleon I. was completed under Napoleon III. in 1857. Much injury was done to the building during the Commune of 1871. Amongst other famous treasures it houses the Venus de Milo and Leonardo da Vinci's masterpiece, *La Gioconda*.

Lovebird, a vivid little bird native to Africa, resembling a parrakeet but with a short, wide tail and short body.

LSD (d-lysergic acid diethylamide). This hallucinogenic drug has achieved wide notoriety because of its use by certain people to give themselves abnormal mental experiences. Doctors have frequently warned against the dangers of its use. It is active in extremely small quantities and a dose as small as a fifty-millionth part of a gram can cause marked disturbances of the mental function in man. LSD has been used in the study of mental disease because it produces symptoms very similar to mental disorders such as schizophrenia. *See* Section P, Part III.

Luddites, a combination of workmen formed in 1811, in a period of great distress, with the object of destroying the new textile machinery then being largely adopted, which they regarded as the cause of their troubles. Their first outbreak was at Nottingham, and was stated to have been started by a young apprentice named Ned Ludd. Afterwards, serious Luddite riots occurred in various parts of the country, especially in the West Riding of Yorkshire, where many people were killed, mills were destroyed, and numbers of rioters were tried and executed. Charlotte Brontë used the period in her novel, *Shirley*.

Lunar Month. *See* Month.

Lung Fishes *or* **Dipnoi.** *See* Dipnoi.

Lutecium, element of the rare-earth metal group discovered in 1907 by Urbain.

Lutheranism. *See* J25.

Lynx, cats of sturdy build, with tufted ears and spotted fur, inhabiting many parts of the world, including Northern and Central Europe. They commit serious ravages among sheep and goats and are very fierce.

Lyon King of Arms, the President of the Scottish Lyon Court, and head of the heraldic organisation for Scotland.

Lyre-Bird, a remarkable family of Australian birds, the males of which possess a beautiful lyre-shaped tail. The bird is not more than 15 in. long, but its tail, displayed during its remarkable courtship dance, is 23 in. in length. There are two species: the Superb and Albert's Lyrebird.

M

Macaque. A family of monkeys which include the Barbary ape (specimens of which live on Gibraltar), the Rhesus macaque (the organ grinder's monkey and the one used for experimental work in the investigation of disease), the Bonnet monkey of southern India and Ceylon, the Crab-eating, and the Pig-tailed monkeys of south-eastern Asia.

Macaw, a genus of large parrots with brilliant scarlet and sky-blue plumage, with interminglings of green. Native to South and Central America.

Mace, originally a weapon of offence, now an ensign of authority borne before officers of state and other dignitaries. In the House of Commons the mace is handed to an official of the Crown by the Sergeant-at-Arms at the close of a parliamentary session.

Mach Number. Unit of flight speed. The ratio of speed of flight to speed of sound under same conditions of pressure and density. Speed of sound at sea-level is 762 m.p.h., so flight speed of 381 m.p.h. is equivalent to a Mach Number of ½. At supersonic speeds the Mach Number is greater than 1; subsonic speeds, less than 1.

Mackerel, a familiar sea-fish existing in large numbers in the northern waters of both hemispheres. In May and June immense shoals are to be found round the British coasts.

Macromolecules are very large molecules about 10,000 times or more as heavy as ordinary small molecules like hydrogen. Most are built up from a large number of simple sub-units, *i.e.*, are polymers (*q.v.*). The term macromolecule is often used in biology, *e.g.*, starch and cellulose are biological macromolecules, both built from glucose sub-units. Other important ones are proteins and nucleic acids. The properties of macromolecules depend on the sub-units of which they are composed.

Madder, one of the most important of dye-stuffs, largely used in producing Turkey-red dye, but now superseded by synthetic alizarin. Natural madder is the root of the *Rubia tinctorum*.

Madrier, a term in military engineering denoting a beam used to support the earth in a mine or fortification, or to receive the mouth of a petard.

Maelstrom, a great whirlpool. The most famous is that off the coast of Norway, between the islands of Moskenës and Mosken, of the Lofoten group, the power of which has been much exaggerated.

Mafia, a secret Sicilian society formed for purposes of vengeance, private and public, prominent about 1860, and again after the second world war. Signor Dolci (*see* **B26**) is working to end Mafia exploitation, intimidation, and violence in Sicily. It was not until 1962 that the Italian Parliament finally admitted that the Mafia existed and decided to set up a commission to study it and the means of eradicating it. The American branch of the Mafia, the Cosa Nostra, has infiltrated many city governments by bribing officials.

Magellan, Clouds of, the name given to a pair of small galaxies, satellite systems of our own galaxy, visible only from the southern hemisphere. On account of their relative nearness to the earth (186,000 light-years), they are receiving much attention from astronomers.

Magenta, a blue-red aniline dye discovered in 1859 by Sir W. H. Perkin, and named after the great battle of that year between the French and Austrians.

Magic. *See* **J26.**

Magistrates *or* **Justices of the Peace** preside over courts of petty sessions, and are appointed by the Lord Chancellor on the recommendation of the Lord Lieutenant of the County. Most J.P.s are laymen and are unpaid. Mayors during their time of office are J.P.s *ex officio*. In certain big towns a legally-qualified, paid, full-time magistrate is appointed, known as a stipendiary magistrate. In London stipendiaries are known as Metropolitan Stipendiary Magistrates. J.P.s are no longer appointed over the age of 60 and they must retire when they reach 70. There are now arrangements for the training of magistrates. *See* **D37, 43, 44.**

Magma, molten rock material rich in volatile constituents prior to its eruption at the surface. On eruption and loss of volatiles it becomes lava.

Magna Carta was sealed by King John at Runnymede on June 15, 1215, in obedience to the insistent demands of the barons, and has been confirmed many times by later monarchs. It was not a revolutionary document. It laid down what the barons took to be the recognised and fundamental principles for the government of the realm and bound king and barons alike to maintain them. Its main provisions were that no man should be punished without fair trial, that ancient liberties generally should be preserved and that no demands should be made by an overlord to his vassal (other than those recognised) without the sanction of the great council of the realm.

Magnesium, a metallic element, symbol Mg, first isolated in 1808 by Sir Humphry Davy, who prepared it by electrolysing the chloride. Its chief ores are magnesite and dolomite. Industrially it is obtained by electrolysis. Many important light alloys contain magnesium. The metal burns with a very bright light, and for this reason it is used in photographers' flash bulbs and also in firework manufacture.

Magnetic Field, Earth's. *See* **Section F, Part IV.**

Magnetic Pole. Either one of two regions of a magnet where the attraction appears concentrated.

Magnetic Storms, large irregular disturbances superimposed upon the normal magnetic field of the earth. They may occur at any time, but are most frequent during equinoctial months and in years of sunspot maxima. World-wide in extent, magnetic storms are most pronounced in the polar regions, being due apparently to intense electric currents located in the upper atmosphere near to the zones of greatest auroral frequency. One theory attributes the high ionisation of these belts to solar radiation. Magnetic storms cause radio fade-outs and interfere with telegraphic communication.

Magnetism, originally the name given to the quality of attraction for iron possessed by lodestone (*q.v.*). Now known to be a phenomenon inseparably connected with electricity (**F18**). Strong magnetic attraction is possessed by a comparatively small class of substances; iron, nickel, and cobalt are the most common elements, but there are several less well known, *e.g.*, gadolinium. Many alloys have valuable magnetic properties which make possible numberless technical devices. New magnetic substances are always being developed (*see* **Ferrite**). The earth acts like a huge magnet with its axis inclined at about 10° to the axis of rotation, the magnetic poles being on the Boothia Peninsula (North Canada) and South Victoria Land (Antarctica). The magnetic field at the surface consists of the regular field of a magnetised sphere with an irregular field superimposed upon it. Variation in the magnetic forces occurs from place to place and from time to time, and maps showing the distribution over the globe of points of the same declination (*i.e.*, the angle which the magnetic meridian makes with the geographical one) are of the utmost importance in navigation. In the south-east of the British Isles, at present, a magnetic needle points 9° and in the north-west 14° west of true north. Little is known regarding the origin of the main (regular) field of the earth, but it is believed that the irregularities are due to the presence of intense electric currents in the upper atmospheres and local magnetisation of rock strata. In 1967 the discovery was claimed of isolated magnetic poles, *i.e.*, north and south magnetic poles existing separately, just as positive and negative electrical charges exist separately. If this is confirmed it will probably rank as one of the most important experimental results of the 20th cent., because of its significance for the theory of electromagnetism and fundamental particles.

Magnetohydro-dynamics. A current-carrying wire always experiences a force if it is in a magnetic field. This is the well-known electrodynamic force, and electric motors work because of it. If the current is carried in a fluid, *e.g.*, a liquid metal or a plasma, these forces cause bodily movements of the fluid, which are in general very difficult to calculate. The forces are then called *magnetohydro-dynamic forces*. Now magnetic fields are themselves produced by electric currents; so a current flowing in a fluid produces a magnetic field, which then reacts on the fluid itself by means of the magnetohydrodynamic forces. In the Harwell machine Zeta, used in studying the technical problems of thermonuclear reactions, this effect acts so as to constrict the electric discharge on to the axis of the tube and thus keeps it away from the walls. This action is assisted by an extra magnetic field produced by a separate current flowing in metallic conductors outside the tube. Thus the hot plasma is contained by magneto-hydro-dynamic forces and not at all by the material tube wall. In practical devices of the future magnetic forces may have to sustain plasma pressures of 60 atmospheres—a pressure for which a thick steel wall would normally be used! *See also* **Plasma Physics.**

Magnificat, the hymn of the Virgin Mary, given in Luke 1, 46 beginning in the Vulgate with the words "Magnificat anima mea Dominum" ("My soul doth magnify the Lord"), and used in the services of all Christian Churches.

Magnitude in astronomy is a measure of the apparent brightness of a star, which is inversely proportional to the square of its distance. A low number indicates a bright star, and a high one a faint star. The *absolute magnitude* is a

measure of *real* brightness, *i.e.*, the brightness a star would have at a standard distance away of 32·6 light years. The distance can be calculated if the apparent and absolute magnitudes are known.

Magnolia, species of the family *Magnoliaceae* comprising many beautiful trees, and shrubs with large and fragrant flowers, and chiefly native to North America and Asia. Introduced in 1688.

Magpie, a well-known bird of the crow family, of glossy black and white plumage, famed for its mischievous propensities.

Magyars, the Hungarian race who came to eastern Europe from S.W. Asia and settled in Hungary in the 10th cent. Their language belongs to the Finno-Ugrian group.

Mahdi, an Arab leader of great influence, invested with powers akin to those of a Messiah in the Mohammedan mind. The title was taken by Mohammed Ahmed, who overran the Egyptian Sudan, and in 1885 captured Khartoum.

Mahogany, a fine hard wood susceptible of a very high polish, and distinguished for the beauty of its colour and markings. Obtained chiefly from the trees of the genera *Swietenia* (Spanish or Cuban mahogany) and *Khaya* (African mahogany) of the family Meliacaea. According to tradition Raleigh had a mahogany table made for Queen Elizabeth.

Maidenhair Tree *or* **Ginkgo**. This tree takes its name from the shape of its leaves, which resemble those of the maidenhair fern. Widely cultivated in China and Japan. It is the only survivor of an order of gymnosperms which flourished in Mesozoic times. Botanically interesting because the male gametes are motile.

Malmaison, château at Rueil-Malmaison, a western suburb of Paris. It derives it name from having been inhabited in the 11th cent. by the Norman brigand Odon, and afterwards, according to the tradition, by evil spirits, exorcised by the monks of St. Denis. It was the residence of Napoleon and of the Empress Josephine after her divorce. She died there in 1814 as the result of a chill caught while showing the Russian Emperor round the grounds. In 1900 it was given to the nation.

Malmsey, a strong, sweet wine originally made in Greece, but now also in Spain, Madeira, and the Azores; known also as Malvoisie.

Maltose, a sugar formed in cereal grains during germination. It is produced by hydrolysis of starch, and further hydrolysis converts the maltose into glucose.

Mamluks, commonly known as Mameluks, were originally—in the 13th cent.—a bodyguard of Turkish and Circassian slaves in the service of the Sultan of Egypt, and attained such influence that in 1250 they were strong enough to appoint one of their own body to the throne of Egypt. After that a succession of Mamluk Sultans reigned down to 1517. Then the Turks annexed Egypt, and the Mamluks were taken into the service of the Beys. They again came to the front after Napoleon's conquest of Egypt, and for a time resumed governmental sway; but in 1811 they were decoyed into the citadel of Cairo and massacred by order of Mehemet Ali.

Mammoth, extinct elephants of gigantic size. In 1799 the first perfectly preserved specimen was found in Siberia in a block of ice. It was in prehistoric times an inhabitant of Britain and other parts of Europe, as well as of Asia and America.

Mammoth Cave of Kentucky, about 10 miles long, is one of a series of spacious caverns formed in the limestone rock formation, and is from 40 to 300 ft. wide and at one point 300 ft. high. Stalactites and stalagmites abound.

Manatee, an aquatic mammal of the sea cow (Sirenia) order of mammals, averaging when full grown from 10 to 12 ft. in length, with shovel-shaped tail, and four limbs and nails which almost give the appearance of arms and hands. In spite of their ungainly aspect, these creatures are believed to have given rise to the legend of mermaids.

Manchus, the original nomadic race inhabiting northern Manchuria who invaded China early in the 17th cent. A Manchu dynasty occupied the imperial throne of China from 1644 to 1911.

Mandarin, the name given to a powerful Chinese official, civil or military, under the old régime, whose rank was shown by the wearing of a button on the cap. Mandarin is the major language of N. China (*see* **M29**).

Mandible, the lower jaw in human anatomy. The two parts of a bird's beak are known as the upper and lower mandible. The term is also used for biting jaws in arthropods.

Manganese, a metallic element, symbol Mn, discovered by Scheele in 1774. It is silver-white, not very hard (it forms a hard alloy with carbon), brittle, and tarnishes when exposed to air. Its chief ore is pyrolusite (manganese dioxide). Steels containing manganese are very tough, and used for making machine parts.

Maniple, eucharistic vestment worn over left arm.

Manna, a tree of the ash genus, *Fraxinus ornus*, growing in the South of Europe and in the East and exuding a sweet substance which is gathered, boiled, and eaten.

Manometer, instrument used to measure gas pressure. Usually a U-tube containing water or mercury, one end open to the atmosphere, the other to the gas whose pressure is to be measured. More sensitive for small pressures than the Bourdon gauge.

Manors were estates originally granted in Anglo-Saxon times as rewards for knightly service, and included the privilege of a special court with jurisdiction, criminal and civil, within the manorial territory. *See* **Court-Leet**.

Mansion House, the official residence of the Lord Mayor of London, stands opposite to the Bank of England, and was erected in 1739–53 from the designs of George Dance.

Mantis. Large insects belonging to the same order as the locusts and grasshoppers. The manner in which the forelegs are held, as though in suppliance, has gained for these insects the common name of "praying mantis." They are distributed throughout the warmer countries of the world.

Manx, the Celtic dialect (Manx Gaelic) of the Isle of Man, now on the point of extinction.

Maoris, the race found in New Zealand at the time of its discovery by Europeans. The Maoris are believed to have migrated from Polynesia about 1350. They number 165,000 (1961), and being very intelligent people have adapted themselves with considerable success to the conditions of civilised life. Until 1870 they were frequently in arms against the Government, but since then have settled down with the Whites as equal citizens.

Maple, trees native to the northern hemisphere. There are over 100 species. The sycamore is the best-known species growing in Britain. The sugar maple abounds in Canada and the eastern parts of the United States. The sugar is tapped by boring holes in the tree in Feb. and Mar., and the juice that escapes is collected and evaporated. The maple-leaf is the Canadian national emblem.

Maquis, name of the dense scrub in Mediterranean France and Corsica, providing good cover for bandits and outlaws. The French resistance movement adopted the name Maquis during the German Occupation, 1940–45.

Marble is limestone in its hardest and most crystalline form. There are many varieties—33 were used in the building of the Paris Opera House—but white is the purest and rarest. White marble was used by the ancient Greeks for their temples and statues. Among the famous marbles of Italy are the Carrara and Siena marbles, which were used by Renaissance sculptors. Devonshire and Derbyshire yield some beautiful marbles and Connemara furnishes a serpentine-marble.

March, the third month of the year, and the first of the old Roman Calendar. It was named after the god Mars, and was the *Hlyd* (storm) *monath* of the Anglo-Saxons.

Mardi Gras, the last day of the Carnival in France, Shrove Tuesday.

Marionettes are puppets moved by strings. They originated in the *Fantoccini* of the 15th cent. which had such a vogue in Italy and elsewhere on the Continent. The English *Punch and*

Judy is a version of Punchinello. Puppet shows were known in the earliest civilisations.

Marl, a rock composed partly of clay and partly of carbonate of lime.

Marlinspike, a pointed iron tool used by sailors to splice wire. The instrument used when rope splicing is called a fid.

Marmoset, small monkeys confined to the New World. Very squirrel-like in appearance, with long bushy tails, and thick woolly fur, they are pretty little animals and the smallest of all monkeys. There are claws, not nails, on their digits, the big toe excepted.

Marprelate Tracts, seditious pamphlets written with great maliciousness by a group of Elizabethan puritans about 1586, and intended to discredit the episcopacy, caused a great sensation in their time, and led to the execution of their supposed author, John Penry.

Marquess *or* **Marquis**, the title next in precedence to that of duke. The first English marquess was Rovery de Vere, Earl of Oxford, who had the honour conferred upon him by Richard II. in 1385.

Marquetry, a kind of inlaying in which thin layers of coloured woods are wrought into a design, and mainly used in ornamental floors.

Mars, the fourth nearest planet to the sun, being 141,500,000 miles distant. Its diameter is 4,215 miles as against the earth's 7,920. There has been much speculation about certain dark lines which some observers have seen on the surface of Mars; photographs give no support to the theory of an artificially constructed network of canals, but it is possible they represent areas covered by some simple form of vegetation of the lichenous type. The temperature of the planet's surface would allow living organisms as we know them to exist, but the quantity of oxygen in the atmosphere would be almost certainly too little to support animal life. American (*Mariner IV*) and Russian (*Zond II*) spacecraft launched in 1964 reached the planet in the summer of 1965. *Mariner IV* took close-up pictures of 1 per cent of the Martian surface. Like the moon it is pitted with craters. Mars has two small moons—Phobos and Deimos.

Marseillaise, the French national hymn, written and composed by Rouget de L'Isle, a French engineer officer, who was inspired to write it in 1792 to encourage the Strasburg conscripts. It immediately became popular, and received its name from the fact that it was sung by the Marseillaise troops while marching into Paris.

Marshalsea Prison, a once well-known house of detention in Southwark. It stood near St. George's Church, and was originally a prison for royal servants convicted of offences, but from 1842 to 1849 was a debtors' prison. It was abolished in 1849. Dickens described it in *Little Dorrit*.

Marsh Gas. *See* Methane.

Marsh Tortoise, an amphibious animal of the order *Chelonia*, spread over many countries and inhabiting ponds and small rivers. There are 42 species, and they are all carnivorous.

Marston Moor, near York, was the scene of the famous battle between Prince Rupert and Cromwell on July 2, 1644. Cromwell's victory was the turning-point in the Civil War.

Marsupials, members of the order of pouched animals. Except for the oppossums of America, all marsupials occur in Australasia. Well-known marsupials are the kangaroos, wallabies, and wombats.

Martello Towers, circular forts erected on the coasts of England early in the 19th cent. as defences against the threatened Napoleonic invasion. So called from the circular fort at Mortella (Corsica), which resisted an English fleet in 1794.

Marten, carnivorous animals of the weasel family, one species of which was once common in Britain, but now seldom met with. Many valuable furs come from martens, *e.g.*, the sable of N. Asia and the marten of N. America.

Martial Law is a term loosely employed to indicate the suspension of the administration of normal civil law and its replacement by military authority when this is rendered desirable by such circumstances as war or rebellion.

Martin, a well-known bird-visitor to Britain. It belongs to the swallow family, and the two species that spend their summers here are the house-martin, which makes its nest of mud under the eaves of houses, and the sand martin, which builds in sandy banks.

Martingale, a long strap or thong of leather, one end of which is fastened to the girth of a horse, between the fore legs, and the other to the bit, or to a thin mouthpiece of its own.

Martinmas *or* **St. Martin's Day**, falls on Nov. 11, and is one of the Scottish quarter days. St. Martin was a popular Saint with our ancestors, and Martinmas was a busy time for the mediæval housewife. It was the date when "Martlemas Beef" was dried in the chimney, and enough bacon and mutton cured to last until the spring, because, owing the the scarcity of winter fodder, fresh meat could seldom be obtained. This diet of dried meat without vegetables caused scurvy, King's evil, leprosy, and other maladies. Originally the goose belonged to Martinmas, not to Michaelmas, the legend being that when Martin was elected Bishop of Tours he hid himself, but was betrayed by the cackling of geese. He died in the 4th cent. The spell of fine weather sometimes occurring at Martinmas is called St. Martin's Summer.

Martyrs. People who suffer death in testimony to their faith. Stephen was the first Christian martyr in 39. The first English martyr was St. Alban, 286, and in Tudor times many eminent churchmen went to the stake at West Smithfield, in London, and at Oxford, where now exists the "Martyrs' Memorial." There is a Martyrs' Memorial Church in St. John St., Clerkenwell, near the scene of the Smithfield fires.

Marxism. *See* J27.

Mason and Dixon's Line is the boundary line separating the old slave states of America from the free state of Pennsylvania. It was drawn by two English surveyors, Charles Mason and Jeremiah Dixon, between 1763 and 1767.

Masques were light dramatic compositions set to music and performed on special occasions. One of the best-known examples is Milton's "Comus," which was given at Ludlow Castle in 1634.

Mass, the service in the Roman Catholic Church in which are enacted and enshrined Christ's words and actions at the Last Supper. It is high or low, *i.e.*, performed with full choral service, or merely by the rehearsal of prayers without singing. Mass was first celebrated in Latin in the 4th cent., and was introduced into England in the 7th cent. The use of a vernacular language was sanctioned by the Second Vatican Council (1965).

Mass Spectrograph, an instrument for separating isotopes. It works by sorting electrified particles according to their masses; the particles stream through a magnetic and possibly an electric field, and the lightest particles undergo the greatest deflection.

Massorah, a collection of criticisms on the Hebrew text of the Scriptures, and rules for its correct interpretation.

Mast, a long round piece of timber or tubular steel or iron, standing upright in a vessel, and supporting the yards, sails, and rigging in general. The earliest ships had only one mast, carrying a simple sail. The number increased until there were 4 or 5, or even more. Above the lower mast of a sailing-ship comes the topmast, and above that, the topgallantmast and royalmast. The position of each mast is indicated by a prefix, as foremast, foretopmast, foretopgallantmast, foreroyalmast, mainmast, maintopmast, etc. The foremast is in the fore of the ship, the mainmast in the centre, and the mizzen nearest the stern. In large vessels nowadays the mast does not extend to the keel, as it formerly did, but is usually stopped at the second deck.

Master of the Revels was an important Court official upon whom devolved the arrangement of Court festivities. The office is at least as old as the time of Edward III. By 1737 it seems to have died.

Master of the Rolls, one of the English judges, formerly a judge of Chancery, but since 1881 a judge of the Court of Appeal only. In addition he has charge of the rolls or records of Chancery and ranks next to the Lord Chancellor and Lord Chief Justice.

Mastodon, an extinct order of quadruped closely

resembling the elephant in structure, but much larger.

Materials Science is a blend of science and technology: it is the use of scientific research methods to study and improve materials for practical use. The deeper understanding so obtained enables scientists to design new substances with hitherto unknown combinations of properties that are useful in engineering, aircraft, nuclear power, surgery, etc. Materials science institutes or university departments will usually contain an assortment of chemists, physicists, metallurgists, ceramicists, engineers, and others because materials science brings to bear on materials a great many specialised techniques. The scientific study of materials is bringing continual improvement in metals, ceramics, plastics, fibres, and many valuable combinations of these.

Mathematics is the language of physics, and uses symbols for expressing measurements, theories, and laws. Mathematical formulae summarise and condense in exquisite simplicity the results of vast numbers of observations and experiments.

Matins, the first of the canonical hours or services of the day in the Roman Catholic Church and Morning Prayer in the Anglican Church. The daily service in the Roman breviary (*q.v.*) consists of eight offices or "hours," fixed by canon, for prayer and devotion. Formerly, Matins was recited or sung at midnight, Lauds at sunrise, Prime at 6 a.m., Terce at 9 a.m., Sext at midday, Nones at 3 p.m., Vespers at sunset, and Compline before retiring for the night. Lauds are now commonly joined to Matins.

Mau-Mau, a secret, anti-European, terrorist movement which agitated the Kikuyu tribe of Kenya during the years 1953–57. Mau-mau was a symptom of native insecurity and discontent; emergency powers were lifted in Nov. 1959, an large-scale reforms were instituted. Kenya attained independence in Dec. 1963 with Mr. Jomo Kenyatta as Prime Minister.

Maundy Thursday, the day before Good Friday, commemorates the Last Supper. "Maundy" derives from Christ's command (mandatum) to his disciples on that day to love one another. It was the custom in the monasteries for the monks to wash the feet of the poor on this day, and for many centuries the sovereigns of England, through their almoners, have distributed money, food, and clothing to "as many old men and as many old women as the Sovereign is years of age." The Royal Maundy ceremony is still observed, special silver money granted by the Royal Almonry is coined for the occasion and the distribution takes place in Westminster Abbey. *See* **U.K. Coinage, Section N.**

Mausoleum, a special place of sepulture, generally for the reception of the remains of members of a royal or other family of distinction. The name is derived from the tomb of King Mausolus at Halicarnassus, erected about 350 B.C., and forming one of the seven wonders of the world.

Mauve, a colouring matter produced from lichens by Dr Stenhouse in 1848, but in 1856 obtained from aniline by William Perkin (1838–1907), who gave it the name Mauveen. This was the first synthetic organic dyestuff ever to be produced, which led to the building up of the great synthetic dyestuffs industry (which Germany dominated before the First World War).

May, the fifth month of the year, but the third of the ancient Roman calendar. Supposed to be named after Maia, the mother of Mercury, to whom sacrifices were offered on the first day of this month. In England in former days May Day was made the occasion of many festivities, including the crowning of the May Queen, dancing round the Maypole, etc.

"Mayflower," the name of the ship which in 1620 conveyed the Pilgrim Fathers, 101 in number, from England to America. *See* **Pilgrim Fathers.**

May Fly. *See* **Ephemoptera.**

Mazarin Bible, an edition of the Latin Vulgate, acknowledged as the masterpiece of the Gutenberg press (1456). It was the first book completely printed from movable types. It is called the Mazarin Bible because the first copy to capture the attention of scholars was found in the library of Cardinal Mazarin, in Paris. Sometimes called the Gutenberg or the 42-line Bible.

Mazurka, a Polish dance in 3-beat time. Chopin wrote many Mazurkas as concert-pieces for the pianoforte.

Meal-Worm is the larva of a beetle—*Tenebrio molitor*—and is found in corn mills, granaries, and bakeries, where it does considerable damage. It is largely used for feeding birds.

Mean. In statistics and mathematics generally understood to be the arithmetic mean. The geometric mean between two quantities is the square root of their product. *See* **Average.**

Mechanical Equivalent of Heat. *See* **Joule.**

Medals, as decorations for military service, were first issued in this country by Charles I., who ordered medals for gallantry to be distributed to certain soldiers in 1643. Medals were also issued to officers and men who were victorious against the Dutch fleet in 1653. After Lord Howe's victory in 1794 a naval medal was instituted. Medals were also struck for the victory of Waterloo, and since that time special medals have been issued in connection with all our wars. The Victoria Cross, a special reward for personal gallantry in the Navy, Army, and Air Force, was instituted in 1856. The George Cross for gallantry instituted in 1940 ranks next to the Victoria Cross. The Military Cross was instituted in 1914.

Median. *See* **Average.**

Medlar, a tree of which the fruit is about 1 in. in diameter and hard fleshed when gathered, but after being stored for a few weeks it softens. It has a peculiar flavour. Its large white flowers give it a decorative appearance.

Meerschaum, a white or yellow-white earthy mineral, found in beds in Asia Minor, Greece, and other places, is a silicate of magnesium allied with water. Its chief use is in making pipe-bowls.

Megalith, a prehistoric monument, consisting of a large single stone or a group of such stones, in a circle as at Stonehenge or in burial chambers as at New Grange, Ireland. Megalithic monuments have been constructed by different peoples in different parts of the world since the third millennium B.C.

Meiosis, a special type of cell division by which the gametes or sex cells are generated, resulting in the sperm or ovum receiving only half the number of chromosomes found in a somatic cell. *See* **Mitosis.**

Mendelian Law. The first statistical rules of inheritance, determining the ratio of variation of characteristics in the offspring of differing individuals, and the classification of characters discontinuously inherited, were first formulated by the Austrian monk Gregor Mendel. The results of his most important experiments in the crossing of peas were published in 1866, and showed that when two races are crossed, the resultant hybrids will exhibit the dominant features of one parent, but the offspring of the second generation will show those of both grandparents. *See* **F37.**

Mendicant Friars, certain religious orders which spread over Europe in the 13th cent., and comprised the Franciscans, Dominicans, Augustines, and Carmelites. Originally they depended entirely on alms.

Mercator's Projection, a method of indicating meridians and parallels of latitudes on maps, introduced by Mercator in the 16th cent., and still universally used in navigator's charts.

Mercury, one of the smaller planets and the nearest to the sun, being 36 million miles distant. It has no satellite. *See* **F7.**

Mercury *or* **Quicksilver**, symbol Hg (Latin *hydrargyrum*) is one of the oldest-known metals, whose chief ore is the sulphide, cinnabar, found in certain parts of Spain, China, Japan, Mexico, and South America. It is liquid at ordinary temperature and is used in the construction of barometers and thermometers. Alloys of mercury are called amalgams. It is also of great value in medicine. The metal is used in the mercury-vapour (or "sunlight") lamp, since the vapour gives a bright yellow-white glow in an electric discharge.

Mercy Killing. *See* **D6(2).**

Meridian, an imaginary circle extending through the North and South Poles and any given place. When the sun is at its midday height at any place it is "on the meridian"; hence the terms ante-meridian (a.m.) and post-meridian p.m.). *See also* **Greenwich Mean Time.**

Merino Sheep were imported into England from Spain in 1788 and had great influence in improving native breeds, especially in regard to the quality of the wool.

Merit, Order of, founded by King Edward VII. in 1902 as a special distinction for eminent men and women without conferring a knighthood upon them. The Order has twenty-four British companions in addition to foreign honorary members limited in number, as the choice of members is, by the Sovereign's pleasure. Lord Kelvin was the founder companion. General Eisenhower (1945), and Dr. Sarvepalli Radhakrishnan (1963) are honorary members. Florence Nightingale (1907) and Professor Dorothy Hodgkin (1965) are the only women to have received this coveted decoration.

Merovingians, the name given to the family that ruled over France from about 500 to 750. Clovis was first of the line and Chilperic the last.

Mesons (from Greek *meso* = middle), a family of unstable particles of mass between that of an electron and that of a proton. Some are positive, some negative, some neutral. No stable meson is known, the longest-lived particle having a lifetime of only two-millionths of a second. The first of these particles was discovered in cosmic radiation in 1937 and called the mu-meson or *muon*. In 1947 a heavier type was discovered called the pi-meson or *pion*, which behaved like the meson predicted on theoretical grounds by Yukawa in 1935. The pion is connected with the theory of nuclear forces. *See also* F13, 14.

Mesozoic. The geological era which includes the Triassic, Jurassic, and Cretaceous rocks. *See* F34.

Metabolism, the general term for the physical and chemical processes occurring within a living organism. *See* F19.

Metalloid, an element which has properties intermediate between those of a metal and a non-metal. Arsenic is a metalloid.

Metamorphic Rocks are such geological deposits as have undergone alterations of structure and mineral reorganisation. The most active agents in producing these metamorphic changes are heat, water, and pressure. *See* F8(2).

Metamorphosis, period of development from egg to adult, during which the animals have different forms, as found, *e.g.*, in the life histories of frog and butterfly.

Meteorites. The word meteor originally signified any natural phenomenon, but in modern usage meteors are small bodies coming from interplanetary space which become luminous by friction on entering the earth's atmosphere. Popularly called "shooting stars." Larger meteors are known as fireballs. Some of these reach the ground. The object which has been a meteor in flight then becomes a meteorite. In some meteorites iron is the predominating element, others are like rock. The iron meteorites are more common amongst those which have been preserved, but falls of rock-like meteorites occur more frequently. At l'Aigle in France in 1803 from 2000 to 3000 meteorite stones fell; this fall is famous because it convinced scientists that meteorites really came from outside our atmosphere. (The largest meteorite stone actually known to have fallen to earth is one which descended in Emmott County, Iowa, in 1870, weighing 437 pounds.) A meteorite weighing no less than 36½ tons found in Greenland is now in New York. On June 30, 1908, an enormous object fell in Siberia in a sparsely-inhabited region. A hot blast destroyed all trees within a radius of about 5–10 miles, the explosion waves being recorded by barographs as far distant as London, Washington, and Batavia. For the next few nights there was in Europe in the northern sky brilliant illumination due to sunlight falling on clouds of dust at a great height in the atmosphere. Whether this dust had accompanied the object in its journey through space like the tail of a comet or whether the dust had come from Siberia is unknown. (Many Russian astronomers now believe this Siberian meteorite, as it is commonly called, was the nucleus of a small comet.) When the place where the object fell was visited in 1927 some 200 craters were found, but no considerable meteorite has been recovered. Meteorites are possibly débris from the disintegration of a body in the solar system.

Meteorology, the science of the atmosphere considered as a heat engine. Deals with weather, climate, optical phenomena, atmospheric electricity, physical processes such as radiation and precipitation, the dynamics and structure of cyclones, anticyclones, etc. Wide application to problems of aviation, agriculture, commerce and shipping. Meteorological observing stations are in operation all over the world, and on the simultaneous or synoptic reports of their instrument readings and estimates of pressure, temperature, humidity, speed and direction of wind, rain, character and amount of cloud, visibility, etc., forecasts, gale, snow and frost warnings are based. Instruments carried by earth satellites outside the atmosphere can make systematic observations on a world-wide basis of the atmospheric circulation, through observation of cloud cover and of the thermal radiation into space from the atmosphere. Such observations are of great importance for meteorology. For example, in 1961, the development of a hurricane in mid-Atlantic was first detected by an American weather satellite, one of the *Tiros* series which have since been used for Weather Bureau routine forecasts.

Methane. The simplest hydrocarbon, compounded of one carbon atom and four hydrogen atoms. This gas occurs over marshes and swamps, where it is liberated in the decay of vegetable matter. It is the main constituent of natural gas, and also occurs in coal-mines, where it is called "fire-damp" because of the explosive character of its mixture with air. Formerly this natural gas was removed from the coal seams and ran to waste; now in many countries (including Britain) it is being used for commercial purposes.

Methodism. *See* J27.

Methylated Spirit, a mixture of 90 parts by volume ethyl alcohol, 9½ parts wood naphtha (methyl alcohol), ½ part crude pyridine, together with small amounts of petroleum oil and methyl violet dye. Industrial methylated spirit consists of a mixture of 95 parts by volume ethyl alcohol and 5 parts wood naphtha. It is used as a solvent and a fuel.

Metre. *See* **English Verse, M14.**

Metre, unit of length in the metric system; since 1960 the wavelength of the orange-red light of krypton 86 has been adopted as the basis of the international unit of length. Before that (since 1889) the platinum–iridium bar kept at Sèvres was the international prototype metre.

Metric System, the system of weights and measures based on the gram and the metre, smaller and larger units being decimals and multiples of the primary units respectively. A decimal currency was adopted in France in 1795 and the metric system of weights and measures in 1799. (In that year the quadrant of the earth was surveyed and the standard metre adopted.) Nevertheless the change was accepted slowly, and as late as 1837 the French Government had to pass a law forbidding the use of the old measures. Since then the metric system has been adopted in most of the continental countries and is used universally in scientific work. Although there have been many attempts to get the system adopted in Britain, it was not until 1965 that the Government announced that it was encouraging the adoption of the metric system of weights and measures. By 1975 the greater part of British industry should have effected the change. The change-over to decimal coinage is to be made on 15 Feb. 1971, and the first of the new coins were issued in 1968. *See* N11.

Mezzotint, an engraving from copper or steel produced by instruments which burnish and scrape away portions of the surface, and yield an impression effectually graded in light and shade.

Mica. The mica of commerce is a nearly transparent mineral, which has great heat-resisting power, and can be split into thin plates. The most important micas are muscovite (potassium mica), the commoner variety, phlogopite (magnesium mica), and biotite, the magnesium and iron mica.

Michael, St., and George, St., an order of knighthood originally founded for the Ionian Isles and Malta in 1818, and reorganised in 1869, so as to admit Crown servants connected with the Colonies. The Earl of Derby, Earl Russell, and Earl Grey were the first of the new knights.

Michaelmas Day, the festival day of St. Michael and All Angels, Sept. 29th, one of the English quarter days.

Microbe, a term proposed by Sédillot in 1878 to denote any microscopic organism, vegetable or animal, or found on the borderland between the two great natural kingdoms. The term is commonly used, but not by scientists.

Microelectronics is a rapidly developing technology of the 1960s which reduces entire electronic circuits to minute size and embeds them in tiny chips of solid material. These are then called integrated circuits. A circuit consisting of, say, a dozen transistors and fifty resistors can be built into a small piece of semiconductor (*q.v.*) measuring not more than a couple of millimetres in any direction. Hundreds of these circuits can be made simultaneously in penny-size wafers of silicon about one-hundredth of an inch thick. There are great advantages in cheapness, reliability, robustness, and speed of electronic performance. The small size is in itself an advantage in space vehicles and medical instruments. Applications to missile control systems, computers, and communications equipment are no doubt only the first fruits of this new achievement of the current technological revolution.

Micrometer, an instrument for measuring minute distances; usually attached to the eye-pieces of a microscope or telescope, and consisting of two very fine hairs or wires stretched across the field of view, one fixed, the other movable. It was invented by William Gascoigne in the 17th cent. and improved by later inventors. Sir Joseph Whitworth made one in 1858 to measure the millionth part of an inch.

Micro-organisms, the collective term applied to several types of organism, the most important of which are fungi, viruses, bacteria, and protozoa. It is a classification of convenience in biological studies. These organisms are generally simple in their environmental requirements (*e.g.*, have simple nutritional needs) and in cellular organisation. This makes them very suitable for modern biological research. Much of the information on the nature of the genetic code (**F24**) was obtained from experiments on these organisms.

Microphone, device for converting the acoustic energy of sound waves into waves of electrical energy, used in sound amplifying systems. Developed independently by Edison (1877) and Hughes (1878).

Microscope, invented about 1590 by Janssen, and improved by Galileo, Fontana, and others, is an instrument which by a lens system magnifies minute objects. Microscopes are simple, compound, and binocular. The more powerful instruments have a magnifying capacity of as much as 10,000 diameters. *See also* **Electron Microscope**.

Middle Ages (*c.* A.D. 400–1500), usually considered to be the period between the decline and fall of the Western Roman Empire and the fall of Constantinople to the Turks (*see* **A4–7**). The period covers (*a*) an earlier part ending with the 12th cent. (sometimes called the Dark Ages) when science was dead, when theology was the main preoccupation, and when the language of the learned West was Latin; and (*b*) a later age of Arabian influence when alchemy and astrology (at that time indistinguishable from astronomy) were central interests, technology was advancing, and Greek learning was transmitted by Arab scholars. Characteristic features of the mediaeval scene were monasticism (**J29**), the Crusades (*q.v.*), Gothic art (*q.v.*), feudalism (**J17**), and the supremacy of Islam in the field of learning. The period came to an end with the ushering in of the Renaissance (**J38**).

Midrash, name given to the homiletical interpretation of some of the Hebrew Scriptures in which allegory and legendary illustration were freely used. Compiled by Jewish rabbis from *c.* A.D. 200.

Millenary Petition was presented to James I. in 1603, on behalf of nearly 1,000 Puritan Ministers against certain of the rites and ceremonies of the Church of England. The Hampton Court Conference was the outcome of this petition.

Millennium, a period of a thousand years. The term is specifically used of the period of a thousand years during which, according to Rev. xx. 1–5, Christ will reign in person on earth. The Millenarians are a sect that interprets the "Millennium" as beginning with the commencement of the 6001st year from the Creation, which, according to Archbishop Ussher (1581–1650), was in 4004 B.C.

Millipede. Arthropods allied to the centipedes, from which they differ in having two pairs of legs to each body segment (except the first three) instead of one pair. Worm-like in shape but with a pair of antennæ on the head, they are vegetarians and can do much harm to garden plants. *See* **T29**(1).

Millstone-Grit, a series of grits and sandstones of deltaic origin underlying the coal measures of the Carboniferous system and attaining in England a thickness in parts of 5,000 ft. It is from this rock that millstones have been made from time immemorial.

Mimicry, protective similarity of an animal to another animal or to inanimate objects. Examples of the former are the hover flies, which mimic wasps and bees; of the latter, leaf insects, stick insects, and caterpillars that look like dead twigs.

Mink. Semi-aquatic mammals closely related to polecats. There is one American species and one European. The fur, which varies light to dark brown, is soft and thick, and is among the most valuable of commercial furs.

Minnesingers were minstrel poets of Germany who, during the 12th and 13th cent., composed and sang verses of heroism and love. They were of knightly rank, the counterpart of the French troubadours. *See* **E3**(2).

Minnow, a small fresh-water fish of the carp family, abounding in all the waters of Europe; it has a mottled back and silvery belly, and forms a popular bait for trout.

Minstrels were originally specially appointed instrumentalists and singers—pipers, harpers, and gleemen—engaged by barons and manorial lords to amuse their tenants. Later, minstrels assumed nomadic habits, made their way into the houses of the great, and were generally welcome. By Elizabeth's time, however, they were too numerous, and were classed as "rogues and vagabonds," along with actors.

Miracle Plays, popular in England in the 15th cent., were usually religious in character, representing some of the dramatic incidents of the Bible. Staging of plays was one of the many activities of the Guilds of those days. *See* **M28**.

Mirage, an optical illusion often observed in desert regions when the objects on the surface of the earth often some distance away appear as if reflected in a surface of water. Mirage is due to the unequal heating of the different parts of the atmosphere, which bends the light rays, and so produces distorted images.

Mishna, the first part of the Talmud, setting forth the "Oral Law" of the Jews.

Missal, the name of the mass-book of the Roman Church compiled 492–96 by Pope Gelasius I., and revised by Gregory I., 590–604. The present Roman Missal was sanctioned by the Council of Trent 1545–63. In the Anglican Communion the Book of Common Prayer superseded the Missal in 1549

Mistle-thrush receives its name from its partiality to the mistletoe-berry. Larger than the song-thrush, with spotted breast rather than speckled.

Mistletoe, a parasitic evergreen with white berries used as a decoration at Christmas-time. The familiar mistletoe of Europe is the *Viscum album*, which grows on the boughs of lime, willow, apple, poplar, maple, ash, hawthorn, but seldom on oak-trees. It was sacred to the Druids, and in Norse mythology it was a mistletoe dart that killed the god Baldur

Mistral, a cold, dry, northerly wind peculiar to the French coast of the Mediterranean.

Mitosis, cell division whereby each daughter cell receives the same number of chromosomes as the parent cell. When the gametes (sex cells)

are formed a special type of division occurs (meiosis) in which the number of chromosomes is halved. *See* F23(2).

Mitre, the twofold pointed head-dress of bishops and certain abbots of the Western Church and occasionally of other ecclesiastics.

Moa, the name for several species of ostrich-like extinct birds related to the New Zealand kiwi. The largest species, *Diornis maximus*, stood 8 ft. 7 in. high. Became extinct about 500 years ago.

Moabite Stone, a stone of the 9th cent. B.C. containing the earliest known inscription in Phoenician characters, and discovered in the highlands of Moab in 1868. It is now in the Louvre, Paris. It records the campaign between Moab and Israel, a differing account of which is given in the Old Testament.

Mode. *See* Average.

Moderator, a material used to slow down neutrons in an atomic pile. Examples of moderators are pure graphite and heavy water. *See* Nuclear Reactors.

Mohole Project, a scheme to bore through the earth's crust to take samples of the mantle rocks beneath. Drilling trials, led by an American team of geophysicists, began in 1961 near the island of Guadalupe off the Mexican coast in the Pacific. The project, however, was cancelled in 1966 on account of the escalating cost. Russian geophysicists have already started on a similar experiment, but are boring through land rocks where the digging will have to be much deeper and higher temperatures are likely to be met with. The name "Anti-Cosmos" has been given to the project. The boundary between the earth's crystal and mantle rocks is known as the Mohorovičić Discontinuity, or, more simply, as the Moho. *See* F8(1).

Molasses, sugar-cane juice in its uncrystallised form after boiling. The crystallised part is the raw sugar. Used to make rum.

Mole, a small burrowing animal with long, sensitive nose, about the size of a small rat, with short legs and forefeet armed with strong claws for digging in the earth. Their subterranean dwellings are of curiously ingenious construction, and they do not often leave them except to make raids on mice, frogs, snails, etc. The earth worm, however, is the mole's chief item of food. Not to be confused with the vole which has a blunt nose.

Molecular Biology, a rapidly expanding branch of science mainly concerned with cell structure and function at a molecular level, in particular with genes and enzymes and the interaction between the two. Recent work in Britain has led to the unravelling of the structure of DNA, the hereditary substance of the genes, and has played a major part in uncovering the molecular mechanism of the transfer of hereditary information and the nature of the genetic code. Crystallisation of the first enzyme (urease) took place in 1929; the gene as a definite chemical entity was discovered in 1943. *See* F19–25.

Molecule. A group of atoms held together by chemical forces. *See* F12(2), *also* Macromolecule.

Molybdenum, symbol Mo, a fairly hard white metal with properties resembling those of chromium. Its commonest ore is the sulphide, molybdenite. The chief use of the metal is in the manufacture of alloy steels.

Monasticism. *See* J29.

Momentum. The momentum of a body is the product of its mass and its velocity.

Monazite, a cerium mineral containing some thorium. Occurs as grains, often as sand ("monazite sands"), derived from granites. Deposits occur in India (Travancore), Russia, Norway, Madagascar, S. Africa, Brazil, U.S.A.

Monday, the second day of the week, called by the Anglo-Saxons *Monandaeg* (moon-day).

Mongoose, species of mammals related to the civets, feeding on vermin and reptiles. These animals, which have long tails and short legs, occur in Africa and Asia (especially India). The biggest mongoose is the Egyptian ichneumon, and this has been introduced into the W. Indies because of its ability to kill large poisonous snakes.

Monitor, a family of lizards most resembling dragons. There are about 30 species widely distributed over the tropical parts of Asia, Australia, and Africa.

Monroe Doctrine, a principle of American policy declining any European intervention in political affairs of the American continent, outlined by President Monroe in 1823. At the same time interference was disclaimed with existing European colonies in the Western Hemisphere. The American Civil War hampered the application of the doctrine for some time, but afterwards the United States firmly insisted on it. The Doctrine is not international law, but a national policy of the U.S.A.

Monsoons, regular persistent winds which blow at certain seasons in middle latitudes, mainly in South and East Asia. Their occurrence is related to the great changes of pressure which take place between summer and winter over the land mass. In India the south-west monsoon (June–Oct.) is moisture-laden from its long passage over the sea and in the higher regions, especially, there is heavy rainfall. Sudden reversal of the wind results in the cold north-east monsoon (Oct.–March) which is dry on account of the shelter afforded by the mountain ranges to the north. Frequently the term "monsoon" is applied to denote the associated rainfall without reference to the actual winds.

Monstrance, an ornamental transparent receptacle in which the Sacred Host is carried in procession or exposed for adoration.

Month, the 12th part of the calendar year. A lunar month is the interval of new moon to new moon or full moon to full moon; mean length, 29 days, 12 hours, 44 minutes, 2·87 seconds. A sidereal month represents the time of the moon's revolution from a given star back to the same again, 27 days, 7 hours, 43 minutes, 11·5 seconds. In English law, since 1926, a month, unless otherwise expressed, means a calendar month.

Monument of London, a 202 ft. column, overlooking Billingsgate, designed by Wren and erected (1671–77) to mark the starting-point of the Great Fire of London (1666). The original inscription upon it ascribed the fire to "the treachery and malice of the popish faction," which stood down to 1831, when the words were erased as objectionable. The black marble staircase has 345 steps (311 to the balcony).

Moon, the earth's satellite, 2,160 miles in diameter and 238,857 miles distant from the earth. It rotates in the same time as it revolves round the earth (27 days 7 hours 43 minutes), so that the same face is always presented to the earth. In 1959 Russia launched her first three moon probes. The second succeeded in hitting the moon and recorded no magnetic field. The third photographed that part of the moon's surface which is never visible from the earth. The U.S. hard-landing *Rangers* in 1964–5 sent back a series of photographs of the surface. From these pictures and from those taken by the Russian *Luna 9* and *13* and the U.S. *Surveyor 1*, which made soft landings in 1966, it is clear that there are craters on the moon's surface. From their shape and distribution it is a reasonable conclusion that the surface is not covered by any great thickness of soft dust. This removes one of the possible objections to the feasibility of a manned spacecraft making a landing on the moon. The exploration of the moon at close range by means of spacecraft was made possible only by parallel developments in several branches of technology—rocket propulsion, long-range radio and television transmission, electronic computer control.

Moorhen, a widely distributed bird of the rail family, a common resident in the British Isles. The adult is blackish with white under tail-coverts, a white line on the flanks, and a yellow-tipped bill. The frontal shield and the base of the bill are vermilion. It bobs its head, flirts its tail, and dives well. The nest is usually placed close to the water's edge or on an overhanging branch. In feeding the young the parents are sometimes helped by their off-spring of a previous brood of the season. In N. America the bird is known as the Florida Gallinule.

Moors, the name given to the Moslems who live in N.W. Africa and to those who once lived in Spain. In 711 Moorish Arabs invaded Spain

and spread beyond the Pyrenees into France, where they were driven back by the end of the century. Spain, however, remained virtually under Moorish domination until the 11th cent., and during that period was the most civilised and prosperous part of Western Europe. In the arts and sciences the impact of Moorish culture was profound and lasting. Examples of the brilliant splendour of Moorish architecture are still to be seen in Toledo, Córdoba, Seville, and Granada. During the long struggle for the Christian reconquest thousands were killed and expelled, and in 1492 Granada, their last remaining kingdom, was forced to surrender They were virtually exterminated by the Inquisition, and the last were expelled in 1609.

Moose, the largest members of the deer family. The N. American Moose stands 5½–6½ ft. high, and has huge palmate antlers. There is another New World species, occurring in Alaska. The European species is known as the elk.

Morse Alphabet, a system of dots and dashes, intended to be used in combination with the indicator in telegraphy: but usually read by sound, the receiving operator writing down the words in the system as transmitted. This system of signals was invented by the American inventor and artist Samuel Finley Breese Morse (1791–1872) of Charlestown, Massachusetts.

Mosaic, art of arranging small pieces of coloured glass, marble, or other materials in such a fashion as to produce a decorative pattern. Some of the best examples of Byzantine mosaics are to be seen at Ravenna, Rome, Venice, and Sicily.

Mosque, a Mohammedan church, the greatest being that of Santa Sophia at Istanbul, now converted into a museum of Byzantine art.

Mosquito, small two-winged flies with long legs and and slender body. Their larvae are aquatic. The females of some species are blood-suckers, and thus come to transmit the blood parasites which cause malaria and yellow fever, for example. *See* D.D.T. *and* Gammexane.

Mosses. Most mosses live in moist habitats, but there are some species that can withstand desiccation and are adapted to live on rocks and tree trunks.

Moths, of the insect order, *Lepidoptera*, differing from butterflies which have clubbed antennae, in having feathery, sometimes thin, pointed antennae, rarely clubbed. Most are nocturnal, and the pupae are usually brown and enclosed in a cocoon unlike those of the butterfly, which are usually naked. *See also* Lepidoptera.

Motion, Laws of. According to Newton: (1) A body continues in its state of rest or uniform motion in a straight line except in so far as it is compelled by external forces to change that state. (2) Rate of change of momentum is proportional to the applied force, and takes place in the direction in which the force acts. (3) To every action there is an equal and opposite reaction. These laws are the basis of almost all engineering and everyday mechanics. Corrections to them have been made by relativity and the quantum theory. *See* F13, 14.

Mule, a hybrid between horse and ass. Also the name of the spinning machine invented by Crompton in 1779 which combined the principle of Hargreaves' spinning jenny with the machine invented by Arkwright.

Mullions, the vertical bars dividing the lights in a window, forming a highly decorative feature in the Tudor period of English Gothic architecture. The cross-beam or horizontal bar of wood or stone in a mullioned window is styled a transom. *See* Windows.

Munich Agreement. In Sept. 1938 Mr. Neville Chamberlain and M. Daladier, British and French Premiers, reached agreement with Hitler at Munich for the dismemberment of Czechoslovakia, primarily for the benefit of Germany. Czechoslovakia itself was not consulted, nor Russia who with Britain and France had jointly pledged themselves to uphold the independence of Czechoslovakia. Hitler had been threatening that country for some time, but every concession had been met by further demands. After three visits to Germany, during which Hitler raised his demands, the British and French statesmen gave way. Mr. Chamberlain declared on return that he had secured "Peace in our Time." The Agreement was the subject of much controversy. Hitler seized Czechoslovakia in March 1939.

Muscles. *See* F27(1).

Musk Deer, a small deer of the Himalayas, standing about 20 in. high. It is grey in colour, slightly brindled, and carries a small pouch in the abdominal region, containing what is commercially known as musk, an article which is of great value in the manufacture of various perfumes. The active constituent of musk, muscone, is now made synthetically. The species was becoming rare on account of its slaughter for its musk.

Mutton Bird, an Australasian name of controversial origin for a shearwater or petrel, *e.g.*, the Short-tailed and Sooty Shearwaters and the Great-winged, Kermadec, and White-headed Petrels. The young are taken by hand from their burrows for human food.

Myrrh, a resinous substance obtained from a tree of the natural order *Amyridaceae*, growing plentifully in Abyssinia and Arabia. Its use for embalming, medical, and aromatic purposes may be traced back to the most remote times.

Mysteries, Greek, secret mystic ceremonies of the ancient Greeks, religious drama accompanied by dancing, the most well known being the Eleusinian and Orphic ceremonies.

Mystery Plays were the mediaeval religious dramas performed by the priests at great ecclesiastic festivals, particularly in France and Bavaria, staging the Nativity, Passion, and Resurrection. *See* M26.

N

Nadir, one of the two poles of the horizon, the other being the zenith. The nadir is the pole vertically below the observer's feet.

Nahum, one of the books of the Minor Prophets of the Old Testament. It is a prophecy of doom on the approaching sack of Nineveh which fell in 612 B.C. to the Medes and Babylonians.

Naiad, a water-nymph of classic mythology, beautiful and mystic; celebrated by Virgil, Ovid, Homer, and other ancient writers.

Nantes, Edict of, was a decree promulgated by Henry IV. of France in 1598, giving full freedom of worship to the Protestants of the country. It was the revocation of this edict in 1685 by Louis XIV. that drove hundreds of thousands of French Huguenots to this country.

Naphtha, a liquid combustible believed to have been one of the ingredients of "Greek fire." Naphtha is a light, highly inflammable oil obtained by distilling petroleum, shale oil, or coal tar. The petroleum naphtha consists of a mixture of paraffins; that from shale contains olefines as well as paraffins. Coal-tar naphtha contains xylol.

Naphthalene is an aromatic hydrocarbon; it is obtained from coal tar, and its derivatives are much used in the manufacture of colours for dyers and printers. "Moth balls" are made of naphthalene.

Narcotic, a medical dictionary definition is that a narcotic is a drug that produces stupor, complete insensibility, or sleep. In terms of drug addiction, a narcotic has been defined as altering and distorting the user's perception of himself and of the external world, being taken primarily for that purpose. *See* P22–24.

Nardus, a genus of coarse grasses, growing on bleak upland heaths and hill slopes. *Nardus stricta*, known as "mat-weed," is a British species.

Narghile, an oriental tobacco pipe so constructed that the smoke passes through water and up a long flexible tube before reaching the lips of the smoker.

Narrative Art, a type of art popular during the late 19th cent. based on the principle: "every picture tells a story"—*e.g.*, such paintings as the little Royalist boy surrounded by his anxious family and confronted across a table by the Roundheads bearing the title: "When did you last see your father?" The term, although often applied derisively, suitably describes many works of considerable artistic merit: *e.g.*, Hogarth's *Marriage à la Mode*, his series of eight engravings entitled *A Rake's Progress*, the Bayeux Tapestry, and many Babylonian and Egyptian friezes.

Naseby, Battle of, was fought on June 14, 1645.

between the Royalists under the command of Prince Rupert and the King, and the Parliamentarians under Fairfax and Cromwell. It resulted in a complete defeat for Charles.

National Anthem, a musical composition with words, officially adopted for ceremonial use as an expression of patriotism and loyalty to a national cause. The national anthem of the United Kingdom is "God Save the Queen" which has been in use since about the middle of the 18th cent. There is some doubt about its origin. It has been variously attributed to Dr. John Bull, Henry Carey, and James Oswald.

National Assembly, the name taken by the body responsible for the opening stages of the French Revolution and subsequently by other sovereign bodies in France and elsewhere.

National Covenant, an oath and declaration subscribed to by the Scottish Presbyterians in 1638 to maintain their religion against Charles I.'s episcopalianising designs.

National Gallery, established in 1824 at Pall Mall, London, with the Angerstein Collection of 38 pictures, purchased for £60,000 as a nucleus. The existing building which was opened in 1838 has been enlarged several times. The National Gallery at Millbank, the Tate Gallery, was given to the nation by Sir Henry Tate in 1897.

Nationalisation is the taking over by the State of the ownership and operation of an industry or service—*e.g.*, coal-mining, railway transport, gas, and electricity. Where this is done without revolution, compensation is usually paid to the previous owners at what is regarded as a fair market price; the compensation is sometimes paid in cash, but more often in fixed-interest-bearing bonds issued either by the State or by the administration of the nationalised service, which is usually a publicly appointed Board or Corporation acting, with greater or lesser autonomy, under the direction of a Minister responsible to Parliament. In some cases the State becomes a partner with private investors in the ownership of a particular enterprise, *e.g.*, oil companies, such as the former Anglo-Iranian and some recent French examples. Nationalisation is usually brought about by a separate Act of Parliament relating to each industry or service taken over. These Acts, in Great Britain, include provision for joint consultation at all levels between the administering boards or commissions and the workers employed and their Trade Unions. When, as in the Soviet Union, nationalisation occurs as an outcome of social revolution no compensation is paid to the dispossessed owners.

National Parks. Under the National Parks Act 1949 a National Parks Commission was set up to create National Parks in England and Wales. Ten have been established: Peak District, Lake District, Snowdonia, Yorkshire Dales, Exmoor, Brecon Beacons, Dartmoor, Pembrokeshire Coast, North Yorks Moors, and Northumberland. It is not intended to change the character of these territories but to control their development so as to harmonise with the two dominant principles: (*a*) that the characteristic beauty of the landscape within the Park area shall be preserved and (*b*) that the visiting public shall have ample access and facilities for recreation and enjoyment. The National Parks Commission also has power to designate areas in England and Wales outside the national parks as "areas of outstanding natural beauty." Twenty-one areas had been designated by 1967: Gower, Quantock Hills, Lleyn, Surrey Hills, Dorset, Northumberland Coast, Cannock Chase, Shropshire Hills, Malvern Hills, Cornwall, N. Devon, S. Devon, E. Devon, E. Hampshire, Isle of Wight, Forest of Bowland, Chichester Harbour, and Solway Coast, Chilterns, Sussex Downs, and Cotswolds. *See also* **Long Distance Routes**.

National Physical Laboratory, situated at Teddington, is one of the world's largest and best-equipped laboratories. It was first established in 1900 under the control of the Royal Society. In 1918 DSIR took over financial liability and in 1964 it became part of the Ministry of Technology. It conducts research in various branches of non-nuclear physics and maintains British primary standards and physical units.

National Portrait Gallery, established in 1856, and now located in a building in St. Martin's Lane adjoining the National Gallery. Contains portraits of eminent people in history, literature, art etc., and a valuable collection of medals and autographs.

National Trust, founded in 1895. "A non-profit-making organisation incorporated by Act of Parliament for the purposes of promoting the permanent preservation of lands and buildings of historic interest or natural beauty for the benefit and access of the people." As a consequence of gifts of public-spirited individuals the Trust now owns many acres of magnificent scenery and property, including mediaeval castles, bird sanctuaries, ancient monuments, birthplaces and homes of famous men, and classic examples of domestic architecture, preserved for the enjoyment of present and future generations. Since 1946 lands and houses of interest to the nation may be given to the National Trust in lieu of death duties.

Nativity. There are three nativity festivals of the Christian Church: Christmas, 25 December, the festival of the birth of Christ; the birthday of the Virgin Mary (8 Sept.); and of St. John the Baptist (24 June).

Natterjack, a curious warty, prominent-eyed, brown toad (*Bufo calamita*), having a bright yellow line down the middle of its back. It utters a muttering sort of croak, hence its name.

Natural Law. *See* **J32**.

Naturalisation, the grant of British nationality to an alien. Before an application can be made to the Secretary of State for the grant of a certificate an alien must have qualified by 5 years' residence in the U.K. or service under the Crown, during the 8 years immediately passed.

"Nautical Almanac," published under the authority of the Admiralty, is always issued four years in advance, and contains information specially prepared for the use of navigators and astronomers. It first appeared in 1767.

Nautilus, a term now applied only to the pearly-shelled nautilus, the sole surviving example of the four-gilled section of the *Cephalopoda*. Its fossil relatives are called Ammonites. The spiral shell is divided into a number of compartments, the animal living in the last and largest chamber There are three or four species, all living in tropical seas. The Paper Nautilus is not related to the Pearly Nautilus, belonging to the same order as the octopus.

"Nautilus," the name of the American nuclear-powered submarine which made the first voyage under the North Pole in Aug. 1958 having navigated a new north-west passage without stars, compass, radio, or radar but using a piece of equipment known as an "inertial navigator." *See* **Inertial Navigation**.

Nave is the body or main open portion of a cathedral or church, and extends from the chief entrance to the choir, or chancel, and is usually flanked by aisles. A nave, in mechanics, indicates the "hub" or central part of a wheel.

Neandertal, the name of the valley lying between Düsseldorf and Wuppertal, where in a limestone cave a now famous skull of a very early species of prehistoric man was discovered in 1856. Fossils of Neandertal man have been found over a wide area, and from archaeological evidence he began to disappear from Europe during the last Ice Age, about 40,000 B.C. *See also* **F39(1)**.

Necromancy, "the black art," was in olden times much believed in, and supposed to be an occult power by which its practitioners could converse with the spirits of the dead and learn the future.

Negroes are the dark-skinned, woolly-headed races, natives of tropical Africa, or descendants of such natives. There are many different racial types, including the Ashanti of Ghana, the Kikuyu of Kenya, the Yoruba of Nigeria, the Pygmies (nomadic hunters living in the equatorial forests), the Bushmen of the Kalahari Desert, the Hottentots of South Africa (who have largely lost their identity), the so-called Bantu peoples of Central and Southern Africa, and many others. Their culture is rich in folklore, and they have great artistic gifts in music, dancing and sculpture. About 25 million people of Negro descent are in N. and S. America, the European slave trade having taken them there from their homes in W. Africa. *See also* **African Languages, M28**.

Negus, the name given to any mixture of wine and water, and said to have been named after Colonel Francis Negus about 1714. The sovereign of Abyssinia is styled the Negus.

Nekton, term used to differentiate actively swimming aquatic organisms (*e.g.*, fishes) from the "drifters" or plankton.

Nelson Column, in Trafalgar Square, London, designed by Mr. William Railton, was chosen from among a number of designs—temples obelisks and various sculptural groups—sent in as a result of a competition held in 1839. The erection of the column was begun in 1840. Twenty-six years later the lions designed by Landseer were set up at the foot of the completed column. The statue of Nelson himself was made by E. H. Bailey and the bronze reliefs at the base executed by Carew, Woodington, Ternouth, and Watson, representing the Battles of the Nile, St. Vincent, Copenhagen, and Trafalgar. Height 170 ft., executed in Portland stone instead of granite, as originally planned, at a cost of £46,000.

Néné or Hawaiian Goose. At the Severn Wildfowl Trust at Slimbridge Mr. Peter Scott has saved this bird from extinction.

Neo-Classical School of Art, a French school of painting and sculpture belonging to the late 18th and early 19th cent. and founded by Jacques David, the Academician, republican, and later admirer of Bonaparte. His classicism probably arose from his republican sympathies, which caused him to paint such works as the *Oath of the Horatii* (Louvre) drawing analogies between revolutionary France and Rome. Because of these views he revolted against the romantic and sensual art of Watteau and Greuze and equally against the realism of Chardin. Among his many famous pupils was Ingres, who later assumed leadership of the school.

Neodymium, an element belonging to the rare earth metal group. Discovered by Welsbach in 1885.

Neo-Impressionism, a development of Impressionism (*q.v.*) by Seurat and Signac during the 1880s who devised the method of painting known as *pointillism* (the application of pure colours in minute touches to form a composite whole, based on a knowledge of the laws of colour and optics). One of the best-known examples of this technique is Seurat's *Sunday Afternoon on the Grand Jatte*.

Neon, inert gas present in air to the extent of about 1 part in 65,000. The crimson glow produced when an electric discharge passes through the gas is familiar in advertising signs.

Neoprene, generic name for a class of synthetic rubbers made from acetylene.

Nepotism, the bestowal of patronage by reason of relationship rather than of merit. It had its origin in the custom of certain Popes to enrich their families out of the offices of the Church.

Neptune. Apart from Pluto this is the most distant of the planets, estimated to be about 2,793 million miles from the sun, and taking about 165 years to revolve around it. Discovered by the German astronomer Galle on Sept. 23, 1846, after its existence had been predicted by Leverrier and Adams.

Neptunium, element 93, one of the four new elements discovered during the progress of the atomic bomb project in the second world war. Neptunium is formed when a neutron enters a nucleus of Uranium 238, and it decays radioactively to yield plutonium.

Neutrino, a neutral particle which carries energy and spin and although possessing little or no mass plays an important part in the interaction of other fundamental particles. The discovery that there are in fact two distinct neutrinos, each with its counterpart, was discovered in 1962 as a result of an experiment made with the 30,000 million-electronvolt proton accelerator at Brookhaven. *See* **F13, 14.**

Neutron, a neutral particle present in all atomic nuclei except the hydrogen nucleus which is a single proton. In the development of nuclear science and technology the neutron has played a most important role and neutrons produce the radioisotopes now widely used in medicine, agriculture, and industry. Neutrons and protons are termed nucleons. *See* **F10, 14.**

New Deal. The measures taken by President Roosevelt in U.S.A. in 1933 to overcome the great economic crisis which broke out at the end of 1929 and to restore the social security threatened by it. The measures were drawn up by a group of experts called a Brains Trust and they provided for recovery by a programme of public works, including large-scale construction of houses and large-scale assistance to farmers. Loans were granted and authorities formed to stimulate activities which reduced the workless from 17 millions to between 7 and 10 millions. Unemployment relief was regulated and enlarged; and social insurance (which for decades had been a subject of dispute, being held to be contrary to American principles of self-help) was introduced. Many of the changes have become a permanent part of American legislation though some laws were repealed by the U.S. Supreme Court as being unconstitutional.

Newgate Prison, now pulled down and replaced by the Central Criminal Court, opened in 1907, was situated near the point where once stood one of the old London city gates There is a record of a prison upon this spot in the 13th cent. Later a new one was built by the executors of Richard Whittington, but this was destroyed by the Great Fire in 1666. Still another new prison on this site was erected between 1778 and 1780. In the Gordon Riots of the latter year it was destroyed by fire and re-erected. It was not used as a prison after 1880.

News Letters were an early form of newspaper, popular in the time of Charles II. They consisted of items of news and gossip collected at the various coffee-houses and other places of public resort. They often included blank pages on which readers wrote their private letters.

Newspapers. The first news-books to be published at regular intervals in Britain appeared in 1662 with news of what was going on abroad translated from German and Italian news-sheets. Licence to print was obtained from the Star Chamber, which until its abolition in 1641 allowed only the printing of foreign news. With the lifting of the ban on domestic news the Press became free. In the reign of Queen Anne English newspapers employed writers of great intellectual power and versatility. Despite the newspaper tax introduced in 1712, the number of newspapers published in London in 1776 had increased to 53, though the standard of writing was below that of earlier times. The development of the Press was greatly assisted in the 19th cent. by the abolition of the "taxes on knowledge," by the introduction of the cheap postal system, and by improvements in printing, distribution, collection of news, and advertising. The *London Gazette*, founded in 1665 (and still appearing twice weekly as the official organ of the Government), is the oldest newspaper living. *The Times*, known throughout the world, began as the *Daily Universal Register* in 1785, and adopted its present title in 1788. The *Manchester Guardian* (renamed *Guardian* in 1959), once a provincial but now a national newspaper with a world-wide reputation, began as a weekly in 1821, and became a daily in 1855. The *Scotsman*, founded as a weekly in 1817 and established as a daily in 1855, and the *Glasgow Herald*, which began as the *Glasgow Advertiser* in 1783, are the leading Scottish newspapers. The London Press, which is national, publishes 11 daily, 2 evening, and 7 Sunday Newspapers.

Newt, amphibians of lizard shape and mottled markings. There are three British species, the largest being the Great-Crested Newt (*Triturus cristatus*), which attains a length of 6 in.

Newton, the unit of force in the metre–kilogram–second (MKS) system. Under its influence a body with a mass of 1 kilogram will accelerate at a rate of 1 metre per second each second.

Newton's Rings. Concentric circular rings, due to the phenomenon of interference, which are seen around the point of contact of a slightly convex lens with a flat plate of glass.

New Towns. The new towns in Britain established under the provisions of the New Towns Act, 1946, are at Basildon, Bracknell, Crawley, Dawley, Harlow, Hatfield, Hemel Hempstead, Stevenage, Welwyn Garden City, Corby, Newton Aycliffe, Peterlee, Skelmersdale, Runcorn, Redditch, and Washington in England; at

Cwmbran in Wales; and at East Kilbride, Glenrothes, Cumbernauld, and Livingston in Scotland. In addition, a new city is to be built in North Buckinghamshire (to be known as Milton Keynes) to provide homes for Londoners, in the Leyland-Chorley area in Lancashire to take population from Manchester, in mid-Wales, and at Irvine in Scotland. It is also proposed to expand Ipswich, Peterborough, and Northampton, and to provide large sites for housing in London. New cities for the Southampton–Portsmouth, Bletchley, and Newbury–Hungerford areas, as proposed in *The South East Study* (1964), to deal with the expected population increase over the next two decades are under review. It is also planned to create a new city in Northern Ireland and to expand a number of towns.

New Year's Day, Jan 1. The first New Year's festival of which we have record is that constituted by Numa 713 B.C., and dedicated to Janus.

Nibelungenlied, the German epic of the early 13th cent. comprising numerous mythical poems or sagas of which several English translations exist. Wagner's *Der Ring des Niebelungen* was based largely on Norse legends and on the Niebelungenlied.

Nicene Creed, a summary of the principles of Christian faith, first issued in 325 by the Council of Nicaea (summoned by the emperor Constantine the Great) for the purpose of thwarting the Arian heresy and asserting the godhead of Christ. Date of Easter fixed at Council of Nicaea.

Nickel, silver-coloured metal, symbol Ni, fairly soft though harder than iron. Chief source of the metal is the nickel sulphide in iron–copper pyrites deposits in Ontario. Chief uses are: in electroplating, in coins, as an element in alloy steels. A novel method of making pure nickel (by treating the metal with carbon monoxide and heating the resulting liquid, nickel carbonyl) was developed in 1890 by Mond. This discovery led to many technical advances in industrial chemistry, one of which is the production of catalysts for a variety of processes.

Niello Work was in considerable vogue in the Middle Ages, and is said to have suggested the idea of engraving upon copper. It was produced by rubbing a mixture of silver, lead, copper, sulphur, and borax into engravings on silver, and some highly decorative results were obtained.

Night-heron, a stocky, short-legged heron of black and white plumage, red eyes, and yellowish legs, crepuscular except in breeding season, and an occasional visitor to Britain.

Nightingale, a familiar singing bird which visits the southern counties of England every summer, and is sometimes found as far north as Yorkshire. It is a shy, brown bird, not often seen, but the song of the male, usually heard in the late evening or at early morn, is of remarkable sweetness and variety. After its wooing period is over its song ceases.

Nightjar, nocturnal, insectivorous bird, owl-like in appearance, with mottled brown plumage of "dead leaf" pattern, and a churring song. It is a common breeding visitor to the British Isles, Apr. to Sept., and lays its eggs on bare ground.

Niobium is a metal element, symbol Nb, related to vanadium. Technical development has been slow because of its rare occurrence, although niobium is now used in ferrous alloys to increase resistance to corrosion and produce steel which can be used at high temperatures.

Nitre *or* **Saltpetre**, is now mostly manufactured by the double decomposition of sodium nitrate and potassium chloride. Its chief use is the manufacture of gunpowder and fireworks. It has been manufactured in England since 1625.

Nitrogen, a non-combustible gaseous element, symbol N, devoid of taste or smell, and constituting nearly four-fifths of the atmospheric air. Nitrogen compounds are essential to plants and animals, and are used in fertilisers.

Nitro-Glycerine, an explosive yellow fluid produced by mixing small quantities of glycerine with a combination of one part of nitric acid and two parts of sulphuric acid. By itself it is a dangerously explosive substance to handle. In 1867, Nobel produced dynamite, a safe explosive made by absorbing nitro-glycerine in kieselguhr.

Nitrous Oxide, a compound of nitrogen and oxygen possessing mild anaesthetic power. Termed "laughing gas" on account of its exhilarating effect. It is still used in dentistry, and for minor operations and has proved useful in a new technique for finding leaks in water mains.

Nobel Prizes. The Nobel Foundation was established at the beginning of the century to give effect to the wishes expressed by Alfred Nobel in his will. The award of a Nobel Prize is accepted as the highest form of international recognition in the field in which it is given: physics, chemistry, medicine, literature and peace. Because of the pace of scientific advance and of the number of research scientists, the Foundation in 1966 announced certain organisational changes in the administration of the Nobel Funds in the interest of scientists and of science generally. *See* L126–8.

Nones were dates of the Roman calendar which fell on the 5th of each month, excepting Mar., May, July, and Oct., when they fell on the 7th.

Non Nobis Domine! ("Not unto us, O Lord!"), a musical canon, sung as a grace at public feasts (traditionally attributed to Byrd).

Norman Architecture is English Romanesque (*q.v.*), which flourished from the time of the Norman Conquest and was gradually superseded through a transition period (*c.* 1175–1200) by the introduction of the pointed arch characteristic of the Early English (first Gothic style). Typical of Norman churches are the round arches, thick walls, massive cylindrical columns, with throughout the basic pattern of the square and the circle. Some churches (*e.g.*, the Temple church in London or the chapel at Ludlow Castle) are wholly circular. Roofs in the early days were flat and towers, usually placed at the "crossing," were square but occasionally round; the spires of all these towers have perished, but it seems likely that they were squat and pyramidal.

North-East Passage, from the North Atlantic to Bering Strait has been rapidly developed by the U.S.S.R. in recent years as a northern sea route to render accessible vast areas of northern Siberia. Attempts to find a north-east passage were made by Englishmen and Dutchmen in the 16th cent. but they were always defeated by the ice, for the sea is completely frozen for some 3,000 miles for 9 months of the year. A Swede succeeded in sailing from Europe to Japan via the Arctic in the late 19th cent. *See also* Arctic Exploration.

North-West Passage, from the Atlantic to the Pacific through the Arctic Seas, has been the dream of navigators for centuries. Attempts to find it were made in the 16th and early 17th cent. by John and Sebastian Cabot, Frobisher, Gilbert, Davis, Hudson, and Baffin. Two centuries later Ross, Parry, Franklin, and others made the attempt; but it was not until 1903–5 that Amundsen, discoverer of the South Pole, made the complete voyage. The American nuclear-powered submarine, *Nautilus*, opened up a new short sea route between the Atlantic and the Pacific when she made her epic voyage under the North Pole in Aug. 1958.

Notre Dame, the famous Paris cathedral, was founded in 1163, and is one of the finest specimens of Gothic architecture in Europe. The best descriptions of the buildings are to be found in Victor Hugo's "Hunchback of Notre Dame."

November, the 9th month of the year originally, but from *c.* 700 B.C., when Numa added Jan., and Feb., it became the 11th month.

Nuclear Energy. Atomic nuclei consist of protons and neutrons joined in various proportions (F10). The heaviest naturally occurring nucleus contains 238 particles (92 protons, 146 neutrons) and is uranium 238 (U^{238}); the lightest is hydrogen, which consists of 1 proton. Neutrons and protons attract one another by very strong forces which are not at all well understood; they are called *nuclear forces*. Consequently it requires energy to be supplied if a nucleus is to be pulled apart into its constituent particles. The energy is required to overcome the attractions of the nuclear forces. Conversely, when the particles rush together to form a nucleus, energy is released in the form of heat or radiation. The energy released when protons and neutrons coalesce to form a nucleus is called

Binding Energy. The binding energy of a nucleus divided by the number of particles involved is called the binding energy per particle, which we will call B. It is very difficult to overestimate the importance of B to the human race. B varies from nucleus to nucleus, and the exact form of its variation is only roughly understood at the present time. But the most significant thing is that B is greatest for elements of medium atomic weight and lowest at the heavy (uranium) and light (hydrogen) ends of the periodic table. This means that if middleweight nuclei can be formed either from heavy ones or from light ones, B increases and *energy is released in either case.*

Nuclear Fission. *See* F12(1).

Nuclear Fusion. If light nuclei are hurled at high speeds into intimate contact they sometimes coalesce and release binding energy (*see* **Nuclear Energy**). This has been studied in laboratories where powerful and energy-consuming machines accelerate small numbers of particles for purely experimental purposes. If useful amounts of energy are to be gained these fusion reactions will have to occur on a bigger scale in an apparatus from which the resulting heat can be extracted in a controlled way. The one "useful" fusion device so far made is the thermonuclear bomb ("H-bomb"). Thermonuclear is the important word. If a suitable gas can be raised to a very high temperature the nuclei are stripped of their electrons and all particles move with very high speeds. The gas is then called a plasma. High enough temperatures will make speeds great enough for fusion reactions to occur and nuclear energy to be released. This is a thermonuclear reaction. For example, in deuterium gas, at temperatures over a million degrees Centrigrade, the deuterium nuclei (*i.e.*, heavy hydrogen nuclei consisting of 1 proton joined to 1 neutron) interact to produce helium nuclei. To obtain a net gain in energy from this process, the temperature must be raised to about 300 million degrees C. and maintained long enough; otherwise the energy released is less than that required to heat the fuel and to make up for heat losses. Many attempts to study the staggering technical problems are being made. In the Harwell machine Zeta (1957) the deuterium gas was contained in a metal tube shaped like a tyre 3 metres across. The temperature was raised by passing a huge electric current (about 200,000 amps.) through the gas for a few thousandths of a second. Temperatures up to 5 million degrees were produced, and new apparatus has since stepped this up. Neutrons have been detected, but the original view that these were evidence of true thermonuclear reactions has not survived later studies. Fusion research is very active in Britain, the U.S.A. and Russia.

Nuclear Power Stations. The nine British nuclear power stations at Berkeley (1962), Bradwell (1962), Hinckley Point (1964), Hunterston (1964), Trawsfyndd (1964), Dungeness "A" (1965), Sizewell (1965), Oldbury (1967), and Wylfa, in Anglesey (1968–69) have all been developed from the classic Calder Hall type, burning natural uranium inserted in a graphite moderator and cooled by carbon dioxide gas. They are called Magnox stations because the fuel elements of natural uranium rods are encased in magnesium alloy cans. The second nuclear power programme for 1970–75, is based on the advanced gas-cooled reactor system. The third programme planned for the end of the 1970s is to be based on the fast breeder reactor.

Nuclear Reactors are pieces of apparatus designed to permit nuclear chain reactions to occur under controlled conditions. (Uncontrolled chain reactions are dangerous, *e.g.*, atomic bombs.) The success of a reactor depends on the neutrons reaching the U^{235} nuclei to produce more fissions and not being wasted in irrelevant processes or simply escaping through the wall of the apparatus (neutrons are quite difficult to contain). The neutrons leaving the scene of fission are rapidly moving, and they stand more chance of causing another fission if they are slowed down. Consequently a material other than the uranium has to be present to facilitate this, and it is called a moderator. A useful moderator is pure graphite. Thus a reactor may consist of alternate blocks of uranium and graphite. If the reactor is too small so many neutrons escape that there are not enough to keep the chain reaction going. The reactor must therefore be greater than a certain *critical size.* In order to intensify or damp down the chain reaction, it is arranged for pieces of neutron-absorbing material, such as cadmium, to be inserted or withdrawn as required. While the chain reaction is proceeding countless numbers of fissions are occurring, each one liberating energy which turns into heat. The temperature therefore increases, and to prevent a catastrophic rise, cooling has to be provided. The reactor therefore has cooling pipes through which a fluid coolant is pumped. The coolant carries the heat away and, in a reactor designed to produce electrical power, the heat is taken to steam-raising boilers and the high-pressure steam is led to turbines which drive the electric generators. What has been briefly described is the type of reactor first used for serious power production at Calder Hall. This is a graphite-moderated, gas-cooled reactor using as fuel natural uranium (*i.e.*, fissile U^{235} greatly diluted with U^{238}). It is also possible to make reactors work without slowing the neutrons with a moderator; these are called *fast reactors.* The design of the prototype fast reactor (PFR) now being built at Dounreay in N. Scotland is based on experience gained with the Dounreay experimental fast breeder reactor which was the first in the world to produce electricity on a commercial scale (1962) and has achieved the highest power output of any of its type in the world. These fast reactors can produce new nuclear fuel in the course of their operation and therefore offer great economies. The British-designed advanced gas-cooled reactor (AGR) successfully developed at Windscale and chosen for the new Dungeness "B" and Hinckley "B" nuclear power stations, promises to produce electricity more cheaply than conventional sources. The alternative method to nuclear fission is nuclear fusion (*q.v.*). The problem of achieving a controlled thermonuclear reactor is one of the outstanding challenging problems of applied physics and although considerable understanding of the phenomena involved has been gained, the solution is still as distant as ever. *See also* **Breeder Reactor.**

Nucleic Acids. Living matter is built up of cells, each of which has a nucleus surrounded by cytoplasm. Cell nuclei are composed chiefly of substances called nucleoproteins, which consist of a protein attached to a nucleic acid (this original name is still used, although nucleic acids are found in the cytoplasm as well as the nucleus). Nucleic acids are complex organic structures made up of chains of compounds called nucleotides (F22(1)). Nucleotide molecules have a sugar group attached to a nitrogenous base and a phosphate group. Only two sugar groups are found in the nucleotides, ribose, giving rise to ribonucleic acids (R.N.A.s, found mainly in the cytoplasm) and deoxyribose, which forms deoxyribonucleic acids (D.N.A.s, found mainly in cell nuclei). Seven different nitrogenous bases have been isolated, so that a number of different nucleotides are possible. A repeating, regular pattern of nucleotides is linked by the phosphate groups, forming nucleic acids. The functions of nucleic acids are of fundamental importance. They are concerned in the process of transmission of inherited qualities in reproduction and in building up body proteins. Lord Todd of Cambridge University was awarded the 1957 Nobel Prize in Chemistry for his work on the structures of nucleic acids; the 1962 Nobel Prize in Medicine (*see* L128) was awarded for the discovery of the molecular structure of D.N.A. *See* F21(2), 22.

Nuncio, a permanent official representative of the Holy See at a foreign court. Nuncios were permanently established during the 16th cent.

Nuremberg Trial. On Nov. 21, 1945, an International Military Tribunal, consisting of one American, one British, one Russian, and one French member, began the trial of twenty-four Nazi leaders. There were four counts: the conspiracy of Nazism; wars of aggression;

war crimes; and crimes against humanity. Twelve were condemned to hanging of whom ten were hanged on Oct. 16, 1946. Goering committed suicide; Bormann has never been found; Papen, Schacht, and Fritsche were acquitted. The rest received varying terms of imprisonment.

Nuthatch, name of a number of tree-creeping birds, plump, with short tail, bluish-grey plumage, and black stripe under eye. Nest in holes and wedge nuts in bark of trees, hammering them to get a kernel. There are three European species, one, *Sitta europaea*, resident in England.

Nylon, a generic term for any long-chain synthetic polymeric amide which has recurring amide groups as an integral part of the main polymer chain, and which is capable of being formed into a filament in which the structural elements are orientated in the direction of the axis. The first nylon of commerical interest was made in 1935, and the world's first nylon factory—in the United States—began production in 1940.

O

Oak, a tree of the genus *Quercus*, including some 300 species distributed over the northern hemisphere and into the tropics. Two species are native to Britain, where the oak is the commonest tree (1 in 3)—*Q. petraea*, more common in the west and north on shallower, lighter soils, and *Q. robur*, more common in the south on deeper, heavier soils. Oak timber is much prized for its strength and durability, and from the time of the Spanish Armada to Nelson's day was in great demand for naval construction. It has always been used for building, flooring, furniture, and cabinet work. The oak is attacked by many insects, the round nut-like oak galls, or oak-apples, being produced by the sting of certain minute gall wasps.

"Oaks," a famous race for three-year-old fillies run at Epsom two days after the "Derby."

Obelisk, a tapering monolithic column, square at the base and pyramidal at the top, regarded by the ancient Egyptians as a sacred stone and usually found at the entrance to the sun temples. Many were transported from Egypt and set up at various times: there is one in the Place de la Concorde in Paris, and one on the Thames Embankment in London—Cleopatra's Needle—originally erected at Heliopolis, centre of the sun-cult, by Tuthmosis III *c.* 1500 B.C.

Observatories existed in ancient Babylon and Egypt. They were erected on tombs and temples. The most famous observatory of Egypt was that of Alexandria, erected by Ptolemy Soter, 300 B.C. It was not until the 16th cent., however, that an observatory adequately equipped for astronomical investigations was built. This was at Cassel. Tycho Brahe's observatory at Uranienburg was erected in 1576. The Royal Observatory at Greenwich was completed in 1675. Mount Wilson Observatory in California has had a 100-in. reflector telescope working since 1917 but Mount Palomar Observatory, also in California, has a 200-in. reflector—the largest in the world, completed in 1949—which can reveal remote galaxies out to a limiting distance of 2,000 million light years. It is known as the *Hale* telescope in memory of Dr George Ellery Hale, the founder of the Mount Wilson Observatory. The 98-in. telescope, the *Isaac Newton*, for the Royal Greenwich Observatory at Herstmonceux Castle was completed in 1967. A number of observatories are devoted to meteorological and geophysical work, the most important in the British Isles being those at Eskdalemuir (Dumfries), Kew, Lerwick, and Valencia (Eire). *See also* **Astronomy** *and* **Telescopes.**

Obsidian, a form of volcanic rock of vitreous structure, and usually a silicate of aluminium, lime, magnesium, etc. Produced when acid lavas are rapidly congealed, it is usually black and fractures like pitch.

Occam's Razor. *See* **J32.**

Occultation, in astronomy, refers to the concealment of a celestial body by the passing before it of some other heavenly body. The most frequent occultation is the eclipse of a star or planet by the moon.

Ocean comprises the great body of water which covers five-eighths of the surface of the earth, and has an average depth of 2 miles. The principal oceans are the Pacific, Atlantic, Indian, and Arctic. *See* **F9.**

Ocean Currents are well-defined streams running over certain portions of the ocean and caused mainly by wind-friction, slope of the sea surface and differences in density of the water, all movements being influenced by the deflective forces due to the earth's rotation. The climatic importance of the great ocean currents is that they constitute one of the means whereby heat is transferred from lower to higher latitudes.

Ocelot, the most common wild cat of S. America. It is about 4 ft. in length, including tail, and of a grey or tawny colour and spotted. Closely related to the Leopard cats.

Octane Number, the index of the knock-rating of petrol. It is based on the arbitrary scale in which iso-octane (which does not cause "knocking") has a value of 100, and normal heptane (which is prone to "knocking") has a value of 0. A good fuel for modern cars must have an octane number greater than 80.

Octarch, the kings of the English heptarchy, Hengist (455) being the first, and Egbert (800) the last.

October, the 10th month, but the 8th in the old Roman calendar. It was held sacred to Mars.

Octopus, a genus of marine molluscs with eight tentacles that bear suckers.

Odyssey, Homer's epic setting forth the incidents of the wanderings of Odysseus on his way back to Ithaca after the Siege of Troy. *See* **H23.**

Oeil-de-boeuf, meaning bull's eye, is the name of a small octagonal vestibule lighted by a small round window in the palace of Versailles. The term is used in architecture for a small round or oval window in friezes, roofs, or domes of buildings.

Oersted, a unit of magnetic-field intensity in the c.g.s. system.

Ohm's Law, propounded by G. S. Ohm in 1827, is expressed in the equation: electromotive force (in volts) = current (in amperes) × resistance (in ohms). The ohm is the unit of electrical resistance in the metre-kilogram-second system.

Oil. The great expansion in energy demand over recent years has been met to a large extent by petroleum oil. This contains a wide range of hydrocarbon molecules of varying complexity. The various components are separated from each other by making use of their different boiling points. Crude oil is heated in the base of a fractionating tower; the various components condense at different temperatures in trays at different levels of the tower. The fraction of a given composition can be increased by "cracking" or breaking down the heavier hydrocarbons into lighter ones. The total world reserves of petroleum oil are still uncertain since large parts of the world are still not fully prospected. However, such information as exists suggests that total reserves from all sources may be between 5×10^{11} and 10^{12} tons of oil.

Okapi, nocturnal ruminant mammal, smaller than the giraffe, chestnut brown in colour with zebra-striped legs, native to the African Congo.

Olbers' Comet was discovered in 1815 by Olbers the German astronomer. Olbers also discovered the asteroids Pallas and Vesta (1802–07).

Old Red Sandstone, the continental rocks formed during the Devonian. *See* **F34**

Olefines, a series of hydrocarbons, in which the hydrogen atoms are double the number of carbon. The first member of the series is ethylene.

Oleic Acid, an important fatty acid present in lard and olive- and cotton-seed oils. Used in soap-making. Olein is the ester formed by the reaction of oleic acid and glycerine.

Oléron Laws or Judgments, were a code of maritime laws, introduced into England in the reign of Richard I. in the 12th cent. Oléron is an island off the west coast of France, opposite the mouth of the Charente.

Olive. This small tree, whose fruit yields olive oil, is a native of the eastern Mediterranean countries, but has been introduced into cultivation elsewhere. Its oil is used for cooking, in packing sardines, and in soap making; the green unripe fruit is pickled for table olives.

Olympiads were periods of four years which elapsed between each celebration of the Olympic

games, held at Olympia in honour of Zeus. These festivals included competitions in literature, art, drama, rhetoric, music, and gymnastics, and they were continued, with intervals, from 776 B.C. to A.D. 394. Athletic revivals have taken place at Athens 1896, Paris 1900, St. Louis 1904, London 1908, Stockholm 1912, Antwerp 1920, Paris 1924, Amsterdam 1928, Los Angeles 1932, Berlin 1936, London 1948, Helsinki 1952, Melbourne 1956, Rome 1960, Tokyo 1964, and it is planned to hold the 1968 Olympic Games in Mexico City. *See* U33, 36.

Onomasticians are scientists who study the fascinating subject of names—names of places and names of people—to find out their origins. They tell us, for example, that Cambridge is an Anglo-Norman corruption of *Grantabrycg* = bridge over the Granta; that Harrow-on-the-Hill was an early Anglo-Saxon settlement—"heathen temple on the hill"; that we owe the ridings of Yorkshire to the Vikings (Old Norse *thrithungr* = third part); that in Scotland *-ton* and *-toun* indicate not a town but a hamlet or village. Onomasticians are also concerned with the international standardisation of place names.

Onyx or **Sardonyx**, a variety of chalcedony built up of different-coloured layers, which are parallel and straight (not curved as in agate).

Oolite, a geological term for the Jurassic oolitic limestones existing through a long stretch of country extending from Yorkshire to Dorsetshire. It abounds in fossils of molluscs and reptiles. The term "oolite" derives from the fact that these rocks are made of egg-shaped particles of calcium carbonate.

Opal, a mineral consisting of hydrous silica, occurring in numerous varieties and colours. Precious opal displays a beautiful internal opalescence, the result of the interference of light waves on the surfaces of layers differing in their water-content. Opal miners are called gougers. Chief source, the Andamooka and Coober Pedy fields of South Australia.

Opera. *See* Section E.

Opium was known to the ancients, and used by them as a medicine. It is obtained from the poppy (*papaver somniferum*), the unripe "head" or seed capsule of that flower yielding a juice which when dried becomes the opium of commerce. The poppy is cultivated in India, Persia, Turkey, Macedonia, and China for the sake of this juice, which yields various alkaloids, such as morphine, narcotine, codeine, etc. These days the drug is rarely used medicinally. *See also* P22(2).

Opossum, marsupial mammals found in the more southerly of the United States, South America, and Australasia. They are arboreal except for the water-oppossum, which eats fish.

Optics, the branch of physics which investigates the nature and properties of light and the phenomena of colour. Burning lenses were known to the ancient Greeks and Ptolomy wrote a treatise on optics A.D. 150. Lenses as visual aids were known in ancient China but eyeglasses were not in use until the 13th cent. Spectacles were in more general use after the invention of printing in the 15th cent. The camera obscura was invented in the 16th cent. and the telescope and microscope at the beginning of the 17th cent.

Oracles were in ancient times supposed to be words spoken by the gods, and it was the custom on important occasions to consult them about the future. The Greeks had the Oracle of Zeus at Dodona, and Apollo at Delphi, while the Romans consulted the Oracles of Mars, Fortune, and others.

Orange, a fruit growing in most sub-tropical climates and in universal demand. It is grown on an evergreen tree that attains a height of about 20 ft. at maturity.

Orang-utan, one of the largest of the anthropoid apes, found only in the swampy forests of Borneo and Sumatra. When full-grown it stands over 4 ft. in height and weighs about 150 lb.

Orchestra, a group of instruments and instrumentalists whose playing is under the direction of a conductor. The composition of a typical symphony orchestra is as follows: STRINGS: 1st Violin (16), 2nd Violin (16), Viola (12), Violoncello (12), Double Bass (8). WOOD-WIND: Flute (3–4), Piccolo (1), Oboe (3), Cor Anglais (1), Bass Oboe (1), Clarinet (3), Bass Clarinet (1), Bassoon (3), Contra-bassoon (1). BRASS: Horn (6), Trumpet (5), Trombone (3–4), Tuba (2). PERCUSSION: Timpani (3–6), Side Drum (1), Bass Drum (1), Cymbals (1), Harp (2).

Orders in Council are issued by the sovereign on the advice of a few selected members of the Privy Council. They must not seriously alter the law of the land. Another class of Orders in Council are issued by authority of an Act of Parliament for the carrying out of its provisions.

Ordination, the ceremony of installing ministers or clergymen in clerical offices, has existed from the earliest times. In the Anglican and Roman Catholic Churches the rites of Ordination are performed by bishops; among Nonconformists the power of ordination rests with the governing bodies of the different Churches.

Organ is a musical wind instrument of ancient origin whose tones are produced by the vibrations of air in pipes of varying length. Basically, an organ consists of a number of pipes grouped in rows or ranks according to their special tone-character. The air is fed by bellows or, in modern organs, by a rotary fan, electrically driven. Each rank is controlled by a slider, and the knob that controls the slider is called a stop. The organist pulls out the stops to give the tones he wants, the other pipes being kept out of action by the slider. When a particular note on the keyboard is depressed the player may hear, by pulling out the appropriate stop, not only the normal pitch but the note in several octaves. A stop of which the notes are of normal pitch is called an 8-foot stop, a 16-foot stop would give an octave lower, a 4-foot stop an octave higher, and a 2-foot stop two octaves higher. The hand keyboard is called a manual, and the foot keyboard the pedal board. The basic tone of an organ is its diapason tone, and is normally of 8-foot length and pitch. Most large organs have four manual keyboards and one pedal board. The most important manual is the great organ which comprises the majority of basic stops. The next in importance is the swell organ, so called because the pipes are enclosed in a box fitted with movable shutters operated by a swell-pedal. The effect provides a controlled crescendo or diminuendo. The tone of a typical English swell has a reedy character. The third manual controls the choir organ—a collection of stops suitable for vocal accompaniment. The fourth manual controls the solo organ—a group of stops which, singly or in combination, may provide a solo melody which the remainder of the organ accompanies. The pedal keyboard controls most of the bass stops. In some very large organs there is a fifth manual controlling the echo organ. This is a small group of stops usually set high in the roof of the building to give the effect of distant music. Most church organs have two or three manuals. Modern cinema organs may have some normal stops but rely chiefly on a number of effects unknown to the straight organ.

Organic Chemistry. The chemistry of compounds containing carbon and usually associated with living organisms.

Oriel Window is a window projected from the front of a building, rectangular, triangular, or pentagonal. The ordinary bay window and bow window are varieties of Oriel. When an Oriel window does not reach to the ground it usually rests upon moulded sills supported by corbels.

Oriflamme, the name of the original banner of the abbey of St. Denis, and adopted by Louis VI. as his standard. It remained the national emblem of France for three centuries. The flag was of red silk, the outer edge being cut in the form of flames.

Original Sin, according to Christian doctrine the corruption that is born with us, as a result of Adam's fall.

Orioles, brilliantly coloured birds, members of the passerine family *Oriolidae*, found in the tropical regions of Asia, Africa, and Australia. The golden oriole, perhaps the most beautiful of them all, with brilliant yellow plumage, black wings and tail, winters in Africa, visits England, and is known to have nested here.

Orion, a famous constellation of the heavens, comprising nearly a hundred stars, all visible to the naked eye. It contains three stars of the second magnitude in a line, and these are called "Orion's Belt."

Ormer, a shellfish (*Haliotis tuberculata*) which occurs in the Channel Islands and on parts of the French coast. It is considered a great delicacy.

Ornithology, the scientific study of birds.

Ornithorhynchus. *See* Duck-bill.

Orogeny, large-scale earth movements, including faulting and folding and sometimes igneous activity, which produce a linear belt of mountains, *e.g.*, the Alpine orogeny in Europe which produced the Alps.

Orphism. *See* J33, H117–128.

Orphrey, the name of an ornamental border of gold and silver embroidered on ecclesiastical vestments.

Orrery, an instrument used in the 18th and early 19th cent. which showed the motions of the planets round the sun and the satellites round their primaries. The first orrery made was named after Charles Boyle, Earl of Orrery.

Orthodox Eastern Church. *See* J33.

Osborne House, near Cowes, in the Isle of Wight, Queen Victoria's favourite winter-residence, and where she died. It was given to the nation by Edward VII., and is now a convalescent home.

Osier, a species of willow growing in damp soils and yielding branches utilised in basket-making.

Osmium, a very hard, bluish-white metal, symbol Os, of the platinum group and one of the heaviest of known metals. It is obtained from certain sands of South America, California, Australia, and Russia. The alloy of osmium and iridium (osmiridium) provides long-wearing tips for gold fountain-pen nibs.

Osmosis, The process by which absorption of liquids through semi-permeable membranes takes place. A solution exerts osmotic pressure (O.P.) or suction in proportion to concentration but also depending on kind of dissolved substance. The roots of the higher plants are covered with fine root-hairs, within the cell-walls of which the sap is normally of a higher concentration than the dissolved matter in the surrounding soil. The root-hairs, therefore, draw into themselves these weaker salt-solutions. (The explanation of water and salt exchanges is complicated by the selective ability of some cells (*e.g.*, roots) to accept or reject particular dissolved substances along with the water. The absorption of salts by a plant is selective, each plant selecting through the semi-permeable membranes of its root-hairs those substances which are most suited to itself.)

Osprey (*Pandion haliaëtus*), a large and magnificent bird of prey, dark brown above and nearly white below. The head is whitish with a dark band from eye to nape. To the British Isles it is a rare passage migrant. In 1959, thanks to the energy and vigilance of the Royal Society for the Protection of Birds, a pair nested in a Scots pine in Inverness-shire and reared three young. Since then more young ospreys have been safely fledged in this sanctuary. The food consists almost entirely of fish, which the bird seizes with its talons. The so-called osprey *plumes do not come from this bird but from the* egret.

Ostrich, the largest living bird, related to the rhea, emu, and extinct moa, now found only on the sandy plains of Africa and parts of S.W. Asia. The male has beautiful white plumes on wings and tail. The wings are useless in flight, but the *birds have a fleetness of foot exceeding that of the swiftest horse.* An ostrich's egg weighs 3 lb.

Otary, any seal which has external ears (as *opposed to the true seals which lack them).* The eared seals make up the family *Otariidae*, which includes the Sea-Lion and the Fur-seal of the N. Pacific.

Otter, an aquatic carnivorous mammal widely distributed over Europe, and at one time very common in England and Wales. The otter averages about 2 ft. in length, exclusive of tail, *has web-feet, and is a very expert swimmer. Otters are harmless and their hunting is a cruel*

tail. It is only found at high altitudes on the Himalayas, and is often called the "snow leopard."

Outcrop. Where a bed of rock appears at the surface of the ground, there is an outcrop of the particular rock. Outcrop coal is surface coal; the mining of such coal is called open-cast mining.

Oviparous, a zoological term referring to animals which lay eggs to be hatched outside the body of the parent.

Ovipositor, the organ by means of which female insects lay their eggs.

Owls, nocturnal birds of prey, distributed over the greater part of the world. Their forward-looking eyes, embedded in rings of feathers, give them a characteristic "owl-like" appearance, and their plumage, usually a mottled blend of browns and greys, is so soft that their flight is almost noiseless. Owls live on small mammals, reptiles, birds, insects, and fish, and are very valuable birds to the farmer. British owls include the barn owl (screech owl), short-eared owl, long-eared owl, tawny owl, little owl. Snowy owls have recently nested in the Shetland Is.

Ox, the popular name of the mammals included in the genus *Bos*. They are hollow-horned ruminants and hoofed quadrupeds, and include the various classes of domestic cattle as well as the different wild species. The adult male is called a bull, the female a cow, and the young a calf. The best-known breeds of domesticated cattle are the Durham or Shorthorn, the Angus, the Jersey, Ayrshire, Suffolk, and Hereford.

Oxalic Acid, an organic acid obtained from numerous plants, such as sorrel and rhubarb, and produced artificially for commercial purposes from sawdust, treated with caustic potash or caustic soda. It combines with metals to form oxalates; used in the manufacture of ink.

Oxford Clay, a geological formation consisting of a bed of blue clay hundreds of feet thick, and forming the lower portion of the Upper Jurassic. It makes good bricks.

Oxford University. The early history of the university is obscure. There was a school at Oxford as early as 1115 and it is known that Robert Pullen, a theologian from Paris, lectured there in 1133. Allusions to Oxford as the most celebrated centre of learning in England occurred in a work of Gerald of Wales in 1184–5. The earliest colleges to be founded were University College (1249), Balliol (about 1263), Merton (1264). In 1571 the university was reorganised and granted a Charter of Incorporation by an Act of Elizabeth. Other colleges and halls with their dates of foundation are: All Souls (1438), Brasenose (1509), Christ Church (1546), Corpus Christi (1517), Exeter (1314), Hertford (1874), Jesus (1571), Keble (1868), Linacre (1962), Lincoln (1427), Magdalen (1458), New College (1379), Nuffield (1937), Oriel (1326), Pembroke (1624), Queens' (1340), St. Antony's (1950), St. Catharine's (1962), St. Cross (1965), St. Edmund Hall (1270), St. John's (1555), St. Peter's (1929), Trinity (1554), Wadham (1612), Wolfson (1965), Worcester (1714), Campion Hall (1962), St. Benet's Hall (1964), Mansfield (1886), Regent's Park (1958), Greyfriars Hall (1953). The women's colleges are:—Lady Margaret Hall *(1878), Somerville (1879), St. Hugh's (1886), St.* Hilda's (1893), St. Anne's (1952). Women were not admitted to degrees (though allowed to sit for examination) till 1920.

Oxygen is the most abundant of all terrestrial elements, symbol O. In combination, this gaseous element forms about 46% of the earth's crust; one-fifth of the atmosphere, eight-ninths by weight of all water. Joseph Priestley in 1774 was the first to separate it from red oxide *of mercury. It is colourless, tasteless,* and odourless, and forms the chief life-supporting element of animal and vegetable life.

Oyster, a bivalve mollusc, of the genus Ostrea, having very numerous species and abounding in nearly all seas. The shell is rough and irregular. *Oysters are exceedingly prolific,* spawning in May and June. *In England and Scotland deep-sea oysters are not allowed to be sold between June 15 and Aug. 4, and other* kinds between May 14 and Aug. 4. In Ireland

stable oyster beds have existed since pre-Roman times; "clocks" are dead oysters.

Oystercatcher, a wading bird with black-and-white plumage and long, orange bill, inhabiting estuaries and sea-shores. Feeds on mussels, shell fish, etc., but not oysters.

Ozone, a modified form of oxygen, containing three atoms of oxygen per molecule instead of two. It is prepared by passing oxygen through a silent electric discharge. When present in air to the extent of 1 part in 4 million parts of air it kills bacteria, and has been used for this purpose in ventilating systems, *e.g.*, that of underground railways. It is present in extremely small quantities in the lower atmosphere but is comparatively plentiful at heights of about 20 miles. The belief widely held that seaside air is particularly rich in ozone is untrue. As ozone absorbs ultra-violet light of certain wavelengths spectroscopic methods, involving the analysis of sunlight, are chiefly used in ozone determinations. *See also* Atmosphere.

Paca, a genus of large rodents found in Central and South America, and resembling the guinea-pig. It is of nocturnal habits, has a streaked and spotted fur, and lives on fruits and plants.

Pacific Ocean. The first European to recognise the Pacific as distinct from the Atlantic was the Spanish explorer, Vasco Nuñez de Balboa, who discovered its eastern shore from a peak in Panama in 1513. The first European to sail upon it was Magellan, who entered it by the strait that bears his name in 1520. Sir Francis Drake was the first Englishman to sail upon it in 1577. The world's greatest ocean depth (6,297 fathoms or just over 7 miles) was established by a British survey ship in 1962 in the Mindanao trench in the Philippine Sea.

Pagan, a person who does not worship God; a heathen. The word is derived from the Latin *paganus* (a countryman or uncultivated person). In the Middle Ages the term was used largely to describe Mohammedans (Moors, Saracens, etc.).

Pagoda, the name given in China, India, and other Asiatic countries to a high pyramidal tower, usually, but not necessarily, connected with a temple.

Palaeontology, the science which is devoted to the investigation of fossils: animal (palaeozoology) and plants (palaeobotany). By studying the markings and fossils of living things in the stratified rocks, palaeontologists have been able to establish with astonishing accuracy a record of the evolution of life through geological time. The geologist at the same time with the evidence of the fossils has been able to work out the order and the age of the rocks. *See also* F34.

Palatinate, a term formerly applied to two German electorates or provinces, the Upper and Lower Palatinates. They are now provinces of Bavaria.

Pale, the name given to the part of Ireland colonised by the English and comprising portions of the counties of Louth, Dublin, Meath, and Kildare. The Anglo-Saxon rulers were styled "Lords of the Pale."

Palimpsests are ancient MSS. or parchments which have been partly effaced and used for fresh writings. Many valuable MSS. were thus lost, but sometimes the second writing has been washed out, enabling the original writings to be deciphered. Among such restorations are a dialogue of Cicero's, a portion of a book of Livy, etc.

Palladium, a scarce metallic element, symbol Pd, similar to platinum, with which it is usually found. It is an expensive metal, with desirable properties as a catalyst in reactions involving hydrogen, since it has a remarkable capacity for absorbing this gas; for example, coal gas and air will inflame in the presence of palladium at room temperature. It forms a silver-white alloy with gold, and this is used in some kinds of jewellery. It is used in expensive watches to make non-magnetic springs.

Pallium, a vestmental ornamentation of white wool presented by the Pope to archbishops on their appointment, and the sign of Papal confirmation.

Palm, a large straight-trunked plant or tree common to tropical countries, and usually fruit-yielding, such as dates, coconuts, etc. Many commodities useful to man are obtained from plants of the Palm family (*Palmaceae*).

Palm Sunday, the Sunday before Easter, upon which occasion it is customary to carry palms to the churches in some countries, in commemoration of Christ's entry into Jerusalem for the Feast of the Passover, when the people went forth to greet Him with palm branches.

Panama Canal. In 1903 the United States signed a treaty with Panama (which had previously seceded from Colombia) which gave the United States rights in perpetuity over a ten-mile-wide strip of land extending across the isthmus for the purposes of building and running the canal. The canal connects the Atlantic and Pacific Oceans, is just over fifty miles long (with sea approaches), and the depth varies from 41 to 85 ft. It is constructed above sea-level, with locks, and has been available for commercial shipping since Aug. 3, 1914. Studies are in progress for the building of a new sea-level canal to replace the present one.

Panda, *or* **Cat-Bear**, is related to the Raccoon, Dogs and the Bear. There are two kinds, the Red or True Panda, resembling a large domestic cat, which lives in the eastern Himalayas and S.W. China, and the Giant Panda, which is more like a bear in appearance and inhabits the mountains of western China. Both frequent the dense bamboo forests of these regions.

Pangolin, the scientific name of the "scaly ant-eater," a toothless mammal, found in W. Africa and S.E. Asia. It has a long extensible tongue which it uses in catching ants and termites, its chief food. When attacked the pangolin rolls itself into a ball, and its scales assume the form of sharp spikes. Pangolins have an Order of their own—the Pholidota, the scale-bearers.

Pantagruel, the leading character in one of the satires of Rabelais.

Pantheon, the famous temple in Rome, originally consecrated to the gods, built by Agrippa in 27 B.C. and rebuilt in the 2nd cent. by Hadrian. Its splendid dome and portico make it one of the most interesting architectural monuments of ancient days. Since the 7th cent. it has been used as a Christian church.

Panther, another name for the leopard, *Panthera pardus*, related to the lion, carnivorous, active climber, found in India, and other parts of Asia, also in Africa.

Papal Infallibility. *See* J33.

Paper has been known in one form or another from very early times. The papyrus reeds of the Nile swamps served the ancient Egyptians for sheets upon which to inscribe their records. The Chinese and Japanese, centuries later, were using something more akin to modern paper in substance, an Asiatic paper-mulberry, yielding a smooth fibrous material, being utilised. With the spread of learning in Western Europe the necessity of a readier medium made itself felt and paper began to be manufactured from pulped rags and other substances. The first known English paper-mill was Sele mill near Stevenage, built about 1490, which produced the paper for an edition of Chaucer in 1498. Other mills were set up under Elizabeth, using linen and cotton as raw material. Other papermaking staples were later introduced, such as surat, esparto grass, and wood-pulp. The chief raw material in the world paper industry is wood-pulp, the main exporters being the timber-growing countries of Canada, Sweden, and Finland. Canada is the world's chief producer of newsprint and supplies a large proportion of U.S. requirements.

Papier mâché means pulped-paper and is a composition of paper pulp and other substances, to which, when moulded into form, coatings of japan, with gilt and coloured inlayings, are added. Elegant and decorative objects are made of papier-mâché. A ceramic papier-mâché is very durable.

Papyrus, the earliest known paper made in Egypt at a very remote period from a large species of reed, *Cyperus papyrus*. This plant is to be found all over tropical Africa, especially in the "sudd" region of the White Nile.

Parachute, the umbrella-shaped safety device used in emergency by the crew and passengers of

aircraft. The first parachute descent from a great height was made in 1797 by André Garnerin who dropped 3,000 ft. from a balloon. *See also* **Parachute Jumping, U21.**

Paraclete (the Holy Ghost, or Comforter), the name used in the English translations of St. John's Gospel, and adopted by Abelard to designate the convent in Champagne founded by him, and of which Héloise became the abbess.

Paradise, a Persian word used by the translators of the Old Testament to designate the Garden of Eden, and since meaning any place of happiness.

Paraffin, a mixture of hydrocarbons of higher boiling point than petrol. Paraffin was first obtained by distillation of coal, the process being discovered about 1830. About 1848, Mr. James Young procured it from mineral oil, and Irish peat also yielded it. The main source of paraffin supply to-day is crude petroleum. It is largely used in the manufacture of candles, for waterproofing, and numerous other purposes.

Parakeets, various small parrots of vivid plumage native to Australia, Polynesia, Asia, and Africa. One of the loveliest of the parakeets is the budgerigar of Australia. *See* **Z21, 23.**

Parallax, the change in direction of a body caused by a change in position of the observer. If the parallax is measured (in degrees of angle) and the distance between the two observation points is known the distance of the observed body can be calculated. The distance of heavenly bodies has been found this way. The first stellar distances were so obtained in 1838 by Henderson, Struve, and Bessel. Stellar distances are so great that even when the two observations are made at opposite points of the earth's orbit round the sun the parallax is always less than 1·0″ of arc. *See* **Aberration.**

Parchment, made chiefly from the skins of animals, usually of goats and sheep, was employed in olden times before printing was invented and superseded papyrus as writing material. Vegetable parchment, invented by W. E. Gaine in 1853, though not equal in strength and durability to skin parchment, is about five times stronger than ordinary paper. Vellum is parchment made from the skins of young calves or lambs.

Paris University, of which the Sorbonne forms a part was founded in the 12th cent. and is one of the greatest educational institutions of Europe.

Parliament, is the name given to the supreme legislature of the United Kingdom. It consists of the Queen, the Lords spiritual and temporal, and the Commons. It meets in two houses: the House of Lords (the Upper or Second Chamber) and the House of Commons. It derives from the Anglo-Saxon *Witans* (*see* **Witan**). The Statute of Westminster (1275) first uses "parlement" of the Great Council in England, which comes from the French word meaning discourse. *See* **Central Government, Section C,** *also* **D5.**

Parliamentary Correspondents sit in the Press Gallery of the House of Commons and describe its proceedings for newspapers either by impressions or a summary of the debate.

Parquetry, the name of a style of flooring consisting of small rectangular wooden blocks laid down according to geometrical pattern.

Parrot, the popular name of a widely distributed family of tropical birds, including the African grey parrot, the green parrot of South America —both familiar cage pets in this country—and the various parakeets, cockatoos, macaws, lories, etc. Many of these birds possess a remarkable gift of imitating sound, especially that of the human voice.

Parsec, unit of distance used by astronomers for expressing distances between stars; equivalent to about three and a quarter light-years.

Parthenogenesis. The development of animals from unfertilised eggs. The drones of the honey bee are parthenogenetic, and the phenomenon is also common among aphids.

Parthenon, the famous Temple of Athena on the Acropolis at Athens, was built under the rule of Pericles between 447 B.C. and 432 B.C. It was made wholly of marble without mortar. The famous sculptured friezes, known as the Elgin Marbles, are now in the British Museum.

Partridge, a well-known British game bird. Close time: Feb. 2 to Aug. 31. Two species are common in Britain.

Passeriformes, the order of perching birds which includes about half the known species.

Passport is an official document issued to a person by his own government, certifying to his citizenship and permitting him to travel abroad. Passports to British subjects are granted by the Foreign Office, authorise bearer to leave the country and guarantee him the state's protection. Passports now cost £2.—and are issued for a period of 10 years. Passports for children under 16 are issued for 5 years in the first instance, renewable then for a further 5 years without fee on production of new photographs, etc. A simplified form of travel document (British visitor's passport) is issued for British subjects wishing to pay short visits to certain foreign countries for a fee of 7*s*. 6*d*., valid for 12 months.

Patricians, the aristocracy of ancient Rome.

Paul's Cathedral, St., is the third cathedral church to be built on the site. It was preceded by a Norman building which was practically destroyed by the Great Fire in 1666. This followed a Saxon church which was burnt in 1086. The present building was designed by Sir Christopher Wren. The foundation stone was laid in 1675 and the structure was completed in 1710. It cost a little under £748,000. Its central feature is the dome, crowned by its cupola and lantern with the golden ball and cross. It escaped serious damage during the air raids of the second world war, but many of the surrounding buildings were laid waste.

***pC* Value,** introduced by Dr. C. L. Whittles in 1935 as a measure of salinity of aqueous solutions (soil extract, irrigation water, etc.); defined as the negative logarithm of specific electrical conductivity in reciprocal ohms. Alone or joined with *pH* (below) is useful as an index of osmotic pressure (*see* **Osmosis**) and related hindrance to plant growth resulting from excess of fertiliser or soil salts. If manuring is balanced, growth is best about *pC* 3.3.

Peacock, a bird of large size and beautiful plumage, its characteristic feature being a tail of brilliant "eyed" feathers, which it can erect and spread out, the males possessing resplendent feathering to a much greater extent than the females. It is related to the pheasant; one species is found wild in the forests of India, and another inhabits Burma and the Malayan regions, in Africa there is the Congo Peacock.

Pean, a term in heraldry indicating one of the furs borne in coat armour, the ground of which is black, with ermine spots of gold.

Peanut, Ground Nut *or* **Monkey Nut.** A member of the pea family native to S. America, but now cultivated in many parts of the world. After pollination, the flower stalk bends down and buries the pod containing the peas ("nuts") in the ground. The oil from these "nuts" can be used for margarine manufacture.

Pearl is produced by certain shelled molluscs, chiefly the oyster. The inner surface of the shells of the pearl oyster yield "mother-of-pearl," and distinct pearls are believed to be morbid secretions, caused by some external irritation. Many fine pearls are found in the actual body of the oyster. The Persian Gulf, Ceylon, the north-west coast of Western Australia, many Pacific islands, and the Gulf of Mexico are among the most productive pearl-fishing grounds. In ancient times Britain was renowned for its pearl fisheries, the pearls being obtained from a species of fresh-water mussel. Western Australia has produced a 40-grain pearl, the finest the world has seen. The largest pearl ever found was the "Beresford-Hope Pearl," which weighed 1,800 grains, over six times as much as the oyster that produced it.

Peat, decayed vegetable matter found mostly in marshy positions, and common in Ireland and Scotland. Peat is coal in its first stage of development; burnt for fuel in many cottage homes.

Peccary, a pig-like animal native to the Americas. There are two species: the collared peccary and the white-lipped peccary, the latter being a vicious and dangerous animal.

Pelican, a genus of bird with long depressed bill pouched underneath so that it can hold a

number of fish in reserve for future consumption. It has immense wings and webbed feet.

Pemmican, venison or other meat, sliced, dried, pounded and made into cakes, used by explorers and others when out of reach of fresh meat.

Penguin, a genus of flightless, fish-eating sea-birds of the southern hemisphere. They are stout-bodied, short-necked, and of small, moderate, or large size. The Emperor and King Penguins make no nest but protect and incubate the single egg by carrying it in the down feathers between the feet and the body. Other species brood in the usual way and may lay as many as three eggs. Penguins use their flippers for swimming under water. All 16 species are bluish-grey or blackish above and white below. They are very sociable and breed in colonies.

Penicillin. An antibiotic drug produced by the mould *Penicillium notatum*, and discovered by Sir Alexander Fleming in 1928. It is one of the most effective chemotherapeutic agents known. The mould produces a number of penicillins, all of which are effective antibiotics. *See* P4(2), 9(1).

Peninsular War lasted from 1808 to 1814. Fought in Spain and Portugal (the Iberian peninsula) by the British, Spanish, and Portuguese forces, chiefly under Wellington, against the French. The latter were defeated.

Pentagon, government office in Washington (the largest in the world), housing many thousands of military and civilian workers in the War Department of the United States (Army, Navy, and Air Force).

Pentateuch, the first five books of the Old Testament—Genesis, Exodus, Leviticus, Numbers, and Deuteronomy.

"Pepys Diary," by Samuel Pepys, was first published in 1825. The original MS. is deposited at Magdalene College, Cambridge. The "Diary" gives a picture of the social life of the period between Jan. 1, 1660, and May 31, 1669.

Perch, a well-known family of fresh-water fish, with dark striped sides. The common perch of British rivers and lakes falls an easy prey to the angler because of its voracity.

Perfumes are essences or odours obtained from floral and other substances. The chief flower perfumes are those obtained from rose, jasmine, orange flower, violet, and acacia. Heliotrope perfume is largely obtained from vanilla and almonds. Among the aromatic herbs which yield attractive perfumes are the rosemary, thyme, geranium, lavender, etc., while orange peel, citron peel, musk, sandalwood, patchouli, and other vegetable products are largely drawn upon. In recent times chemistry has been called into play in aid of the perfumer, and many of the popular perfumes of to-day are chemically prepared in simulation of the scents of the flowers or other natural substances the names of which they bear. *See* **Musk Deer.**

Periclase, a mineral form of magnesium oxide.

Perigee. The moon or the sun is said to be in perigee when it is at its least distance from the earth. The opposite of apogee (*q.v.*).

Perihelion. That point in a planet's orbit when it is nearest to the sun. The opposite of aphelion.

Peripatus, an animal which stands as a link between the annelid worms and the arthropods. Wormlike with short unjointed legs it breathes by a system of air tubes like those in insects. Certain other points of internal structure point to a relationship with annelid worms. There are some fifty species, the best known being the S. African *Peripatus capensis*.

Perjury, the offence of giving false evidence. The ancient Romans threw the perjurer from the Tarpeian Rock, and after the Empire was Christianised, those who swore falsely upon the Gospel had their tongues cut out. The usual punishment in England from the 16th to the 19th cent. was the pillory, fine, and imprisonment.

Permian Formation, a group of rocks lying between the Trias and the Carboniferous strata. It has three subdivisions, Upper, Middle and Lower Permian. *See* **F34.**

Per Procurationem signature means that the subject of the correspondence has been put into the writer's care by his principal for him to use his personal judgment in the matter, and that he is authorised to sign on behalf of his principal. Normally contracted to *per pro* or *p.p.*

Peruke, the name given to the wigs worn by men in the latter half of the 18th cent. The custom of wearing wigs was gradually superseded by powdering the natural hair. Wigs are still worn by the Speaker of the House of Commons, judges, and barristers.

Petrel, the name given to a member of a large, widely-distributed family of sea-birds of great diversity of size and colouring and distinguished by tube-like external nostrils. They usually skim low over the waves, and some, for this reason, are known as shearwaters. The storm petrel or Mother Carey's chicken occasionally patters along the surface, and is often called Little Peter—a reference to St. Peter walking on the water. Except when breeding, petrels are always at sea. They mostly nest in holes and crevices on islands and lay one egg, which is invariably white. The storm petrel, Leach's petrel, Manx shearwater, and the fulmar petrel are resident in the British Isles. *See also* **Mutton Bird.**

Petroleum. *See* **Oil.**

Pewter, alloy of tin and lead formerly much used for making household utensils and ornaments.

***pH* Value.** Introduced in 1909 by the Danish chemist Sørensen to indicate hydrogen-ion concentration on the basis of electrical conductivity and a view of ionisation since discarded; is now taken as a logarithmic scale of acidity or alkalinity of aqueous solutions: acidity 0–7, neutrality at 7·0, alkalinity 7–14. The *pH* of blood is about 7·6 (faintly alkaline).

Phalanger, pouched marsupial mammals. They are arboreal and superficially resemble squirrels. There are two genera of flying phalangers or flying squirrels, which have a remarkable membrane along each side of the body enabling the animals to glide through the air. The members of the phalanger family are confined to the Australasian and oriental regions.

Phalangid, a member, of the arachnid family Phalangida: popularly known as "harvesters."

Phalanx, a name applied by the ancient Greeks to a body of troops drawn up in close array, with overlapping shields, and eight, ten, or more rows deep. The Macedonians stood sixteen deep. A Greek phalanx consisted of 8,000 men.

Pharmacopoeia, an official publication containing information on the recognised drugs used in medicine. Each country has its own pharmacopoeia. The British Pharmacopoeia (B.P.) is published under the direction of the General Medical Council. The Pharmaceutical Society issues the British Pharmaceutical Codex (B.P.C.); there is also an International Pharmacopoeia (2 vols.) which is issued by the World Health Organisation.

Pharos, the name of the first lighthouse, built by Ptolemy II. about 280 B.C., on the Isle of Pharos, at the entrance to the harbour of Alexandria. It was 600 ft. high, and one of the "seven wonders."

Pheasant, game birds related to the partridges, quails, peacocks, chickens, and turkeys, distinguished by their brilliant plumage and long tapering tail. First found by the Greeks in Georgia where the River Phasis flows through to the Black Sea. Close time: Feb. 2 to Sept. 30.

Philippics, the orations delivered by Demosthenes, 352–341 B.C., against Philip of Macedon—remarkable for their acrimonious invective. The word was also used for Cicero's speeches against Antony. In modern use, any impassioned invective.

Philosopher's Stone. *See* **Alchemy, J2.**

Phoenix, a fabled bird of Egyptian mythology.

Phosphorus is a non-metal element, symbol P. Most familiar as a waxy, yellow solid which is spontaneously inflammable in air. It has chemical similarities to arsenic, like which it is very poisonous. It was discovered by Brandt in urine in 1669. It is found in most animal and vegetable tissues. It is an essential element of all plants and of the bones of animals. In combination with various metals it forms different phosphates, which are largely utilised as manures. The chief commercial use of phosphorus is in the preparation of matches.

Photoelectric Cell, a device which gives a useful electrical response to light falling on it. There are several kinds depending on the different effects which light may have on a suitably

chosen solid (usually a semiconductor), viz., the emission of electrons from the surface ("photo-emissive cell"); change in electrical resistance ("photoconducting cell"); generation of electric current from a specially designed sensitive structure ("barrier layer" or "photo-voltaic cell", "solar battery"). Different cells respond differently to lights of various wavelength and must be chosen for each application. *See also* **Solar Battery.**

Photogrammetry, the science of measurement from photographs taken from an aircraft. Aerial photography has many uses and is of great value to military intelligence and for map-making.

Photon. When light behaves like a stream of discrete particles and not like waves, the particles are called photons. *See* **F13(1), 14.**

Photosynthesis. *See* **F21.**

Phrenology. *See* **J34.**

Phylloxera, a genus of plant-lice related to the aphids, which attacks the grape vine. Many vineyards of France, in common with the rest of Europe, were replanted with native vines grafted on immune stocks from California in 1879 after being ravaged by the insect (which came from America). Curiously enough, the remedy also came from America, the vine stocks there being immune to *phylloxera.*

Picts, inhabitants of Scotland in pre-Roman times, are held by some historians to be a branch of the old Celtic race, by others to have been of Scythian origin. They occupied the north eastern portion of Scotland, and were subdued by the Scots in Argyll in the 9th cent., Kenneth MacAlpin becoming king of a united kingdom of the Picts and Scots—the kingdom of Alban.

Pike, a familiar fresh-water fish abundant in the temperate regions of both hemispheres. It forms good sport for the angler in rivers and lakes, and sometimes attains a weight of from 20 to 30 lb. It is extremely voracious, is covered with small scales, and has a ferocious-looking head

Pilchard, a fish of the herring family, but with smaller scales and more rounded body. It appears off the Cornish coasts in vast shoals every summer.

Pilgrimage, the undertaking of a journey to a distant place or shrine to satisfy a religious vow or secure spiritual benefit, was resorted to in early Christian times The first recorded pilgrimage is that of the Empress Helena to Jerusalem in 326. In the Middle Ages pilgrimages became common, and were undertaken by monarchs and people of rank in all Christian countries. Moslems have been making pilgrimages to Mecca since the death of the Prophet, such duty being enjoined by the Koran. Among the great centres of Christian pilgrimages are Jerusalem, Rome, the tomb of Becket at Canterbury, and the holy places of Lourdes and La Salette in France.

Pilgrim Fathers, the 101 English Puritans, who, after living some years in exile in Holland, to escape persecution in their own country, set sail for America in the *Mayflower*, Sept. 6, 1620, landing at Plymouth, Mass., Dec. 4. They founded the settlement of Plymouth, and are regarded as the pioneers of American colonisation although 13 years earlier a small Virginian colony had been established.

"Pilgrim's Progress," Bunyan's famous allegory, written in Bedford gaol. The first part was issued in 1678. It is the greatest work of its kind. *See* **M25(1).**

Pillory, a wooden instrument of punishment in use in England until 1837. It consisted of a pair of movable boards with holes through which the culprit's head and hands were put, and was usually erected on a scaffold. While a person was undergoing this punishment the mob generally pelted him with stones and rubbish, sometimes to his serious injury. People convicted of forgery, perjury, or libel were often condemned to the pillory, but from 1816 to 1837 the only offence for which it could be inflicted was perjury.

Pine, a conifer of the genus *Pinus*, which flourishes all over the northern hemisphere and includes 80–90 species, which afford valuable timber and yield turpentine and tar. The Scots Pine, *Pinus silvestris*, with its blue-green, short needles, set in pairs, and its rosy-orange branches, is native to Britain, as it is to the whole of Europe. It provides the red and yellow deal in everyday use.

Pipa, a species of toad inhabiting Guiana, and not found elsewhere. It is of considerable size, and is remarkable for the fact that the female carries its eggs on its back until they are hatched, herself depositing them in that position. Generally known as the "Surinam toad."

Pitcairn Islanders were originally the mutineers of the *Bounty*. They took possession of the island in 1790, and it was not until 1814 that their whereabouts was ascertained, accidentally, by a passing ship. The mutineers, under their leader, Adams, had settled down to a communal existence, married Tahitian women, and increased so in numbers that in the course of years they were too many for the island to support, and in 1856 they were removed by the British Government to Norfolk Island. A small number returned to Pitcairn.

Pitchblende *or* **Uraninite,** a relatively scarce mineral. It is nearly all uranium oxide, but lead, thorium, etc., are also present. Pitchblende from Joachimstal in Czechoslovakia was the material in which radium was discovered by the Curies. Pitchblende also occurs in Saxony, Rumania, Norway, Cornwall, the Congo, and at Great Bear Lake in Canada.

Plague. *See* **Black Death.**

Plainsong, a style of musical composition sung in unison (all voices singing the same tune without harmony), familiar in the Western Church from very early times and still performed, principally in the Roman Catholic Church. Though restrained and contemplative in spirit, it is capable of expressing deep emotion.

Planetarium, a complex optical system which projects into the interior of a dome a replica of all the phenomena of the sky that can be seen by the naked eye, *e.g.*, sun, moon, planets, stars, comets, meteors, aurora, eclipses, and clouds. There is a planetarium in the Marylebone Road, London, and another (opened in 1966) at Armagh Observatory, N. Ireland.

Planets, the name give to such celestial bodies as revolve round the sun in elliptical orbits. The name was first used by the Greeks to indicate their difference from the fixed stars. There are nine planets, Mercury, Venus, Earth, Mars, Jupiter, Saturn, Uranus, Neptune, Pluto. Many important questions can be answered by means of probes sent to the neighbourhood of the planets. These include the measurement of the magnetic field, if any, of the planets, the study of their atmospheres, much of which can be done without actually penetrating to the surface. With instruments landed gently on the surface it is possible to investigate surface conditions and composition by many methods. Even without a soft landing information on these questions can be obtained by photography and subsequent transmission of the picture back to earth by some form of television scanning. For example, the American Mars probe, *Mariner IV*, transmitted pictures of the Martian surface in 1965 when it was at its closest approach to the planet, and the Russian *Venus IV* in 1967 made a soft landing on Venus. *See* **F7,** *also* **Earth's Magnetic Field, Section F, Part IV.**

Plankton, a word which first came into biological use in 1886 to describe the usually microscopic plants and animals floating, swimming, and drifting in the surface waters of the sea. To be distinguished from *nekton* (swimming animals like fishes and squids) and *benthos* (plants and animals living on the sea bottom, like fixed algae, sponges, oysters, crabs, etc.). Of great economic importance, providing food for fish and whales.

Plantagenets, the kings who reigned in England between 1154 and 1485 and included the Houses of Lancaster and York. More correctly they are styled Angevins, from Anjou, of which Geoffrey, father of Henry II., was Count, and whose badge was a sprig of broom (*planta genista*).

Plasma Physics is the physics of wholly ionised gases, *i.e.*, gases in which the atoms initially present have lost practically the whole of the electrons that usually surround their nuclei, so that the gas consists of a mixture of two components, positively charged ions and negatively

charged electrons. The problems to be solved in the controlled release of the energy of fusion reactions are problems in plasma physics. A professorship of Theoretical Plasma Physics was established at Oxford in 1962 and research is carried out at the Culham Laboratory of the UKAEA. The physical properties of a *plasma* are very different from those of an un-ionised gas. In particular, a plasma has a high electrical conductivity and can carry large currents. *See also* Nuclear Fusion.

Plastics, a broad term covering those substances which become plastic when subjected to increased temperatures or pressures. The Plastics Industry is based on synthetic organic examples of this group. There are two classes of plastics: the *thermoplastic*, which become plastic every time they are heated (*e.g.* cellulosic plastics) and *thermosetting*, which undergo chemical change when heated, so that once set they cannot be rendered plastic again (*e.g.* Bakelite). Plastics are composed of long-chained molécules, *e.g.*, polyethylene.

Platinum, a metal element, symbol Pt. It is a scarce white metal generally allied with iridium, osmium, ruthenium, and palladium. It can only be melted in an oxyhydrogen or electric furnace, but can be rolled out into a film-like sheet, or drawn out to the finest wire; being resistant to acids it is termed a noble metal.

Platonic Solids, five regular solid figures known to the ancient world. They are: the tetrahedron (4 triangular faces), cube (6 square faces), octahedron (8 triangular faces), dodecahedron (12 five-sided faces), icosahedron (20 triangular faces). All the faces and angles of each solid are identical.

Plebeians were the ordinary citizens of Rome as distinct from the patricians. There was a long struggle between the two orders for political equality.

Pleiades, famous cluster of stars in the constellation of Taurus. Of the seven principal stars in the group, one is rather faint, and many myths have sprung up about this "lost pleiad".

Pleistocene the geological period that succeeded the Pliocene. During the Pleistocene, also known as the *Great Ice Age*, there were four cold periods, when the ice sheets covered northern Europe and N. America, separated by warm periods when the glaciers drew back into the mountains. From recent studies based on rock magnetic measurements the transition to Pleistocene took place about 1,850,000 years ago.

Pliocene, the geological period preceding the Pleistocene, and the last major division of the Tertiary strata. It began about fifteen million years ago. *See* F34.

Plough Monday, the first Monday after the Epiphany, when in olden times the rustic population returned to work after the Christmas festivities.

Plover, wading birds, widely distributed over marshy places of Europe. Several species occur in Britain, including the Golden-plover, which breeds on the moors of Devon, Somerset, Wales, N.E. Yorkshire, and Scotland, and the Ringed plover, Kentish plover, and Dottérel.

Pluto, the last planet to be discovered; existence established by C. W. Tombaugh at the Flagstaff Observatory in Arizona in Jan. 1930 from reckonings made by P. Lowell in 1914. It is the most distant of all the known planets; diameter about 3,650 miles. Mean distance from the sun estimated at 3,671 million miles.

Plutonium, a chemical element, symbol Pu, capable of nuclear fission in the same way as Uranium 235. Not until after it had been synthesised in atomic piles during the second world war was it shown to occur in infinitesimally small traces in nature. Its synthesis in the atomic pile depends on the capture by Uranium 238 nuclei of neutrons; immediate product of this reaction is the element neptunium, but this undergoes rapid radioactive disintegration to plutonium. Because of its explosive power and poisonous character, an American scientist once remarked: "If ever there was an element which deserved a name associated with hell, it is plutonium."

Poet Laureate is the poet attached to the royal household, an office officially established in 1668, though its origins go back to the early Middle Ages, when minstrels were employed at the courts of English kings. Chaucer, Skelton, and Spenser, though not court poets, were all unofficial poets laureate. Ben Jonson has been called the first "official laureate" (1616), but the office was not officially recognised until 1668, when Dryden was formally granted the office. It is customary for the poet laureate to write verse in celebration of events of national importance. Cecil Day-Lewis succeeded John Masefield as poet laureate in 1967.

Pogrom. Russian word meaning "destruction." First used to describe the Tsarist attacks on the Jews in 1881 in Russia. In 1938 Hitler ordered a general pogrom in Germany: all synagogues were destroyed and nearly all Jewish shops and homes, Jewish hospitals and children's homes suffered. During the subsequent war Jews of central Europe were systematically exterminated in cold blood by the Nazis.

Poitiers, Battle of, was fought on Sept. 19, 1356, during the Hundred Years' War, when Edward the Black Prince gained a complete victory over John, King of France, who was taken prisoner and brought to London.

Pole-Cat, an animal of a dark-brown colour, about 18 in. in length, exclusive of tail; the ears and face-markings are white or light brown. It is carnivorous and belongs to the weasel family. Like the skunk, it emits an offensive odour.

Pole-Star is of the second magnitude, and the last in the tail of the Little Bear constellation. Being near the North pole of the heavens—never more than about one degree from due north—it always remains visible in the Northern hemisphere; hence its use as a guide to seamen.

Police, a regular force established for the preservation of law and order and the prevention and detection of crime. The powers they have vary from country to country and with the type of government; the more civilised and democratic the state, the less police intervention. England, compared with countries abroad, was slow to develop a police force, and it was not until 1829 that Sir Robert Peel's Metropolitan Police Act established a regular force for the metropolis, later legislation establishing county and borough forces maintained by local police authorities throughout England and Wales. Up to that time police duties were discharged by individual constables and watchmen appointed by local areas in England and Wales. The former 121 regular police forces in England and Wales have been reduced, by amalgamation, to 77. They are:—

1. County forces, under a Police Committee.
2. Borough forces, under Watch Committees, elected by the borough councils.
3. Combined forces covering more than one county or borough, under a body representing the constituent areas.
4. The Metropolitan Police Force, covering a 15-miles radius from Charing Cross, under the control of the Home Secretary.
5. The City of London force, under a committee of the Common Council.

The Home Office is actively engaged in providing the police with the form of organisation and the most modern scientific equipment best suited to the battle against crime.

Pollution of the atmosphere is due chiefly to the incomplete combustion of fuels, especially coal, large particles of soot being deposited fairly quickly close to their place of origin and smaller particles (including smoke) remaining suspended in the air for a long time. Corrosion of exposed objects and damage to buildings result from the production of sulphuric acid. The introduction of more efficient furnaces, the washing of flue gases and the introduction of smokeless zones have assisted in the abatement of smoke and other forms of pollution. Estimation of polluting substances is carried out systematically in Great Britain by the Department of Scientific and Industrial Research, the dust and matter brought down with the rain being collected in large deposit gauges; automatic filters provide continuous records of the variation of the floating solid impurities; and apparatus is employed to measure the concentration of sulphur dioxide. Nuclear tests add to the load of pollution in the

atmosphere (*see* Fall-out). "Smog" (smoke-laden fog) which reduces visibility to zero and affects the respiratory organs, is liable to occur when the air near the earth is cooled below the dew-point temperature by radiation on a still, cloudless night when an accumulation of smoke over a large city cuts off daylight and produces gloom, and absence of wind or vertical currents prevents the lower layers of the air from getting away. Such conditions are associated with the smoke-laden atmosphere of large industrial towns during a winter anticyclone. During the great London smog of 1952 there were 2,000 deaths over and above those expected for the time of year. Since the Clean Air Act of 1956 the pall over London has been thinned by some 40 per cent though the amount of sulphur dioxide has gone up slightly. The Act allows local authorities to control emissions of dark smoke, grit, and dust and to establish smoke control areas in which the emission of any type of smoke is prohibited. Householders in smoke control areas may apply for a grant towards the cost of installing appliances to burn smokeless fuel.

Polonium, a radioactive element, symbol Po, discovered by Madame Curie in 1898, and named after her native land of Poland.

Poltergeist. *See* J35.

Polymerisation is the linking together of small molecules to make a large long-chain molecule. The general name for polymers of ethylene is Polythene, a wax-like plastic solid which because of its special qualities is used in a variety of ways today.

Polytheism. *See* God and Man, J18.

Pomander, name of a small ball or box containing perfumes and spices, formerly carried suspended from the neck or girdle as a protection against infection so it was believed.

Pomology, the science of fruit-growing.

Pontifex, the title assigned in ancient Rome to members of the college of pontifices. "Pontifex maximus" was the official head of Roman religion. It was as "pontifex maximus" that Julius Caesar revised the calendar in 46 B.C., and when after the rise of Christianity the popes took over the title the revision of the calendar fell to them.

Pope, The, the head of the Roman Catholic Church, recognised by that Church as the lawful successor of St. Peter. He is elected by the body of Cardinals. Since 1870, when the King of Italy deposed the holder from temporal power, no pope had left the Vatican between appointment and death until 1929, when peace was made between the Church and State in Italy and compensation was paid to the Holy See for the loss of temporal power. Cardinal Montini, Archbishop of Milan, was elected Pope Paul VI in 1963 on the death of Pope John XXIII.

Porcelain. The word is thought to be derived from the Italian *porcellana*, indicating the texture of a piglet. The majority of porcelain made on the continent was of "hard-paste", or true porcelain, similar to that discovered by the Chinese as early as the T'ang Dynasty (A.D. 618–907). It was composed of *kaolin* (china-clay) and *petuntse* (china-stone) which when fired in a kiln at a temperature of *c.* 1300° C. became an extremely hard and translucent material. The recipe of "hard-paste" porcelain remained a secret of the Chinese until 1709, when it was re-discovered in Europe by Johann Böttger of the Meissen factory (popularly known as Dresden). Aided by disloyal Meissen workmen, factories were later established at Vienna, Venice and in many parts of Germany. Plymouth and Bristol were the only English factories to produce this type of porcelain, from 1768 to 1781. Elsewhere, both in England and France, the material manufactured was known as "soft-paste" or artificial porcelain which was made by blending varying white-firing clays with the ingredients of glass. The French factory of Sèvres began to make some hard-paste porcelain by 1768 and by the 19th cent. such porcelain was the only type being made throughout the whole of the continent. In England Josiah Spode is credited with the introduction of "bone-china" about 1794. This hybrid-paste was quickly adopted by many other factories and today remains the most popular type of English porcelain. *See* Pottery and Porcelain Marks, Section N.

Porcupine, a rodent whose back is covered with long, sharp, black and white spikes, which form a powerful means of defence. There are two families of porcupines: one is confined to the Old World and the other contains the American porcupines.

Porphyry, a form of crystalline rock of many varieties that in ancient Egypt was quarried and used for the decorative portions of buildings and vessels. The term is applied generally to the eruptive rocks in which large well-formed crystals of one mineral are set in a matrix of other minerals.

Porpoise, a highly intelligent marine mammal of the dolphin and whale family, and a common inhabitant of northern seas. Porpoises travel in shoals, their progression being marked by constant leapings and plungings. Their average length is from 4 to 5 ft. There are several species, nearly all being confined to northern oceans.

Port, a special kind of red Portuguese wine, taking its name from Oporto. It was little known in England until the Methuen Treaty of 1703, when it was permitted to be imported at a low duty.

Portcullis, a strong, movable timber or iron grating let into the wall of the gateway to a feudal castle, and capable of being lowered or raised at will. It formed an effective protection against attack in the days before firearms.

Portland Vase, one of the most renowned specimens of ancient art, long in the possession of the Portland family. In 1810 it was loaned to the British Museum. Here it was shattered in 1845 by a stone from a maniac's hand, but has been skilfully restored. It is said to have been found in the 17th cent. in an ancient tomb near Rome. It was purchased from the Barberini family in 1770 by Sir Wm. Hamilton, subsequently sold to the Duchess of Portland. The vase, which is actually a two-handled urn, stands about 10 ins. high, is of transparent dark blue glass, ornamented with figures cut in relief in overlaid white opaque glass. It was purchased by the British Museum in 1945.

Portreeve in olden times was an official appointed to superintend a port or harbour, and before the name of mayor was used the chief magistrate of London was styled the Portreeve.

Positivism. *See* J35.

Positron, the "positive electron," an atomic particle having the same mass but an electric charge equal but opposite to that of an electron. It was discovered in 1932. *See also* F14.

Post-Impressionism, a term introduced by Roger Fry to describe the exhibition of paintings sponsored by himself in London (1910–11) officially entitled "Manet and the Post-Impressionists." The exhibition included paintings by Manet, Cézanne, Gauguin, Van Gogh, Seurat, Signac, works by Matisse, Rouault, and the *Fauves* (*q.v.*), and sculpture by Maillol. In a second exhibition, held in 1912, Picasso and the Cubists were also represented. The term therefore refers to the movement in modern art which reacted against the transient naturalism of the Impressionists by concerning itself primarily with colour, form, and solidity. Most artists today would include Cézanne, Van Gogh, and Gauguin as the main Post-Impressionists and maintain that it prepared the way for Fauvism, Cubism, and Expressionism.

Potassium, a metal, symbol K (German *Kalium*). It is similar to sodium, like which it reacts violently with water. It was discovered by Sir Humphry Davy in 1807, and now generally obtained by the electrolysis of fused potassium hydroxide or chloride/fluoride mixture. Its principal minerals are carnallite and kainite, and it is relatively common in rocks, accounting for about 2½% of the earth's crust. An essential element for healthy plant growth; the ashes of plants are relatively rich in potassium.

Potsdam Agreement was signed by Truman, Stalin, and Attlee in Aug., 1945. By this Agreement a Council of Foreign Ministers was established, representing the five principal Powers: China, France, Soviet Russia, the United Kingdom, and United States of America, with the task of drawing up the peace treaties for submission

to the United Nations. It laid down, *inter alia* that German militarism and Hitlerism should be destroyed; that industrial power should be so reduced that Germany would never again be in a position to wage aggressive war; that surplus equipment should be destroyed or transferred to replace wrecked plant in allied territories; that Germany should be treated as an economic whole; and that local self-government should be restored on democratic lines as rapidly as was consistent with military security. The Potsdam Agreement became a dead letter with the creation of a communist régime in the Russian zone of Germany, and marked the beginning of the "cold war."

Prado Gallery, the great public picture collection of Madrid, containing a superb collection of paintings by Velasquez, Murillo, Raphael, Titian, Dürer, Van Dyck, Rubens, Holbein, etc.

Pragmatism. *See* J35.

Prefect, chief magistrates in ancient Rome. The title is now applied to the chiefs of administration of the départments of France.

Pre-Raphaelite Brotherhood was the name given to their school of thought by three British artists, Dante Gabriel Rossetti, J. E. Millais, and W. Holman Hunt, who in 1848 revolted against the academic art of their time and advocated a return to the style of the Italian painters prior to Raphael—the simple naturalism of the Primitives, such as Botticelli, Fra Angelico and Fillipo Lippi. Thus they avoided the use of heavy shadows and painted on a white ground in bright colours—a technique which aroused the ire of those used to the dark and murky canvases of the contemporary romantic artists. Although they held these principles in common the three members of the "P.R.B.", as it was popularly called, were really quite different in other respects. Thus Rossetti (who for some reason is always thought of as the typical Pre-Raphaelite) produced works of a highly romanticised mediaevalism which, apart from certain aspects of technique, bear not the slightest resemblance to the sentimental naturalism of Millais or the much more dramatic realism of Holman Hunt (*e.g.*, in *The Scapegoat*). The Brotherhood was later joined by a number of lesser artists, but its works are not commonly accepted with enthusiasm to-day when the general feeling is that they are sentimental and religiose rather than the product of deeply-felt emotions. Ruskin in his writings defended their work but the movement came to an end in 1853.

Presbyterianism. *See* J35.

Press-Gang, a body of sailors employed to impress men into naval service, frequently resorted to in England, especially during the war with France in the early 19th cent. Press gangs were not used after about 1850.

Primitive Art. The word "primitive" has a number of different meanings: (1) the art of prehistoric communities (*e.g.*, the famous animal cave-drawings of the Aurignacians, *c.* 25,000 B.C., at Altamira in Spain); (2) the art of modern primitive communities (*e.g.*, Bushman rock-paintings); (3) child art; (4) peasant art which springs from a spontaneous desire to impart beauty to objects of daily use and shows a tendency towards abstraction. Peasant art has many features in common the world over, the woodcarving of the Norsemen being almost indistinguishable from that of the Maoris; (5) the modern school of primitive painting in which naïveté of presentation is either the aim of a highly sophisticated mind (*e.g.*, the self-taught French painter Le Douanier Rousseau (d. 1910)), or arises naturally from a simple one (the American "grandma" Moses (d. 1961) who began to paint in her seventies).

Printing by movable types was first used in Europe in 1454 by Johann Gutenberg, a citizen of Mainz. The invention is also claimed for Laurens Koster of Haarlem. It was introduced into England by Caxton, who set up a printing press in Westminster in 1476. Gothic characters were first used, being superseded by Roman letters in 1518. In 1798 Earl Stanhope replaced the wood printing press by one of iron. In 1814 Friedrich Koenig applied the principle of steam power to the press. Mr. John Walter, of *The Times* newspaper, was the first to use the steam press which printed 1,100 sheets per hour. Improvements were introduced by Applegath and Cowper in 1828 and great strides were made in 1858 when the Hoe machine, which turned out 20,000 impressions an hour, was put on the market. Then came the Walter press in 1866 which printed on continuous rolls of paper from curved stereotyped plates. Modern Hoe machines can print a 48-page paper at 28,000 copies an hour (max. speed 50,000). The Monotype machine casts single letters and the Linotype whole lines.

The Privy Council is the Queen's own Council, consisting of over 300 distinguished men drawn from all walks of life. Its function is to give private advice to the Queen. From it have sprung many organs of the constitution. For example, the Judiciary or courts of justice have grown from the Queen's Council sitting as a Court of Justice, and today the Judicial Committee of the Privy Council is a body of distinguished lawyers acting as a Court of Appeal from courts of the Commonwealth. Many of our Government Departments have grown from Committees of the Privy Council.

Probation Officers are attached to particular Courts, sometimes a Magistrates' or a higher court. Sometimes an offender is not sentenced to punishment, but is released "on probation," that is on the condition that he behaves well and follows directions given by the Court or by a probation officer. Such an officer is a trained man (or woman) who advises, assists, and befriends people who have been committed to his care by a court of law. The probation officer, by his assessment of the social background of the offender, can advise the court upon the wisdom of putting the offender on probation. The probation officer by his understanding can so befriend an offender as to provide a basis for his rehabilitation. He undertakes the "after care" of those released from prison or Borstal or approved schools, to which juveniles are sent. *See also* **Juvenile Courts.**

Productivity. Physical productivity is the output of products during a time unit, *e.g.*, so many products per man hour, or day, or year. Total productivity is the sum of all the units of product created during the given time. Labour productivity is the part of the total that is attributed to labour as a factor of production. Productivity of capital is the element attributed to capital as a factor. Productivity of land is the element attributed to the natural powers of the soil, as distinct from what is contributed by the application to it of capital or labour. The term productivity is also used to refer not to the quantity of output, but to its money value. There have been many attempts to compare the productivities of different economies—*e.g.*, Great Britain and the United States or advanced and underdeveloped countries.

Propane, a colourless inflammable gas made of carbon and hydrogen; formula C_3H_8. It is easily liquefied and transported liquid in cylinders and tanks. In this form it is familiar as a "portable gas supply" for domestic and industrial uses. It is sometimes mixed with butane (*q.v.*) for this purpose. Propane occurs in natural gas and is a by-product of oil refining.

Proteins are the main chemical substances of living matter: they are a part of every living cell and are found in all animals and plants. Proteins have many functions, and occur in structural matter such as bones, tendons, skin, hair, and hoof, and in some vitamins and hormones. Lean meat, fish, and eggs are almost entirely proteins. Their composition varies with the source, but all proteins are basically constructed of carbon, hydrogen, oxygen, and nitrogen, and some contain sulphur, phosphorus (nucleoproteins), and iron (haemoglobin). Proteins are built up of very long chains of amino-acids connected by amide linkages (the synthetic polymers such as "nylon" and casein plastics (from milk) are built up of the same linkages). Enzymes, which bring about chemical reactions in living cells, are proteins having specific properties. *See* F26(1).

Proton, a basic constituent of the atomic nucleus, positively charged, having a mass about 1836 times that of the electron. It is a positive hydrogen ion. *See* F10(2), 14.

Protoplasm. *See* F19(2).

Prout's hypothesis. The English chemist William Prout (1785–1850) advanced the idea that all atoms are made of hydrogen, and their weights are exact multiples of the weight of a hydrogen atom. With the modification that neutrons as well as protons occur in the nucleus, Prout's belief, though rejected for many years, has been substantially vindicated.

Provost, a Scottish official similar in rank to an English mayor. The Provosts of Edinburgh, Glasgow, Aberdeen, Perth, and Dundee are styled Lords Provost. The title of provost is also given to the heads of various English colleges.

Prud'hommes (Prudent Men), Councils of, were French trade tribunals, of masters and workmen, formed to decide on disputes. Originally a mediaeval institution, they were revived by Napoleon in 1806, and were carried on by the Third Republic.

Psalms, Book of, for many years attributed to David, but present-day scholars are of opinion that the psalms were written by a series of authors at different times and for different purposes, and that few, if any, were written by David. The Holy Scriptures contain 150.

Psychic Research. *See* J36.

Ptarmigan, birds of the grouse family, one species of which inhabits the Scottish Highlands. In the winter the bird assumes a white plumage.

Ptomaines, amino acids produced during the putrefaction of proteins of animal origin. Not a cause of food poisoning, as was once generally supposed, which is almost invariably due to certain specific bacteria.

Publicans, under the Roman Empire, were people who farmed the public taxes. It is this class of officials that is alluded to in the " publicans and sinners " phrase in the New Testament.

Public Corporations. A method of operating large-scale industries transferred from private to public operation. Thus the Port of London Authority is an independent corporation governed by users of the port and representatives of municipal interests and labour. The Forestry Commission, the Electricity Authorities, the British Railways Board, the National Coal Board, the Gas Council, and the B.B.C. follow a varied pattern.

Public Schools. The Public Schools Act of 1864 named nine " public " schools: Eton, Harrow, Rugby, Winchester, Westminster, Shrewsbury, Charterhouse, St. Paul's, and Merchant Taylors. Today the term embraces many more, and can be applied to all those schools which are financed by bodies other than the State and whose headmasters belong to the Headmasters' Conference as distinct from the Headmasters' Association. There are about 200 such schools in Britain, including among others: Bedford Grammar School (founded 1552); King Edward's School, Birmingham (1552); Brighton College (1845); Charterhouse School, Godalming (1611); Cheltenham College (1841); Christ's Hospital, West Horsham (1552); City of London School (1442); Clifton College, Bristol (1862); Dulwich College (1619); Eton College (1440); Felsted School (1564); Haileybury College (1862); Harrow School (1571); Malvern College (1865); Manchester Grammar School (1515); Marlborough College (1843); Merchant Taylors' School (1561); Mill Hill School (1807); Oundle (1556); Radley (1847); Repton School, Derbyshire (1557); Rugby School (1567); St. Paul's School (1509); Sherborne School (1550); Shrewsbury School (1552); Stonyhurst College (1594); Tonbridge School (1553); Uppingham School (1584); Wellington College (1859); Westminster School (1339); Winchester College (1387); and Warwick (914). Public schools for girls include: Christ's Hospital, Hertford (1552), Cheltenham Ladies College (founded by Miss Beale in 1858), North London Collegiate School (founded by Miss Buss in 1850), Roedean (1885), Wycombe Abbey (1896).

Puma, a carnivorous mammal of the cat family found in the New World from Canada to Patagonia.

Pyramids of Egypt, on the west bank of the Nile, are vast stone or brick-built structures with inner chambers and subterranean entrances, built by the Pharaohs as royal tombs and dating from about 3000 B.C. The most celebrated are at Giza built during the 4th dynasty. The largest, originally 481 ft. high, is called the Great Pyramid, one of the seven wonders of the world, built by the Pharaoh Khufu, better known as Cheops, and there he was buried, 100,000 men, according to Herodotus, being employed for 20 years upon it. Chephren, successor of Cheops, erected the second pyramid, and the third was built by Mycerinus, a son of Cheops. The pyramid at Meidum built by King Snefru, founder of the 4th dynasty, is the most imposing of all. American and Egyptian scientists are cooperating in a project to X-ray (by means of cosmic rays) the interior of the Pyramid of Chephren.

Pyrite, the brassy-yellow crystalline form of iron disulphide. It can often be seen in coal; known as " fool's gold ".

Pythons, large snakes, non-poisonous, and destroying their prey by crushing it. Some species average 30 ft. in length, and prey upon deer and other small mammals. Found in Asia, Africa, and Australia. They lay eggs.

Q

Quadrant, an astronomical instrument for measuring altitudes, superseded for navigational purposes in modern times by the sextant. It consists of a graduated arc of 90° with a movable radius for measuring angles on it.

Quadrille, adapted from an old French country dance, became fashionable throughout Europe in the early part of the 19th cent., but seldom danced now.

Quai d'Orsay. An embankment in Paris where the French Foreign Office is situated.

Quail, an edible bird of the partridge family, of which only one species, the Common Quail, is found in England. It is not more than 8 in. long. It is found in most of the warmer regions of the world. In England and Wales the Quail is covered by the Wild Bird Protection Acts.

Quair, an old name for a pamphlet or little book.

Quantum Theory. The rapid development of quantum theory has been almost entirely due to the experimental and theoretical study of the interactions between electromagnetic radiation and matter. One of the first steps was taken when it was discovered that the electrons emitted from metals due to the action of ultraviolet radiation have an energy which is not related to the intensity of the incident radiation, but is dependent on its wavelength. Einstein showed in 1905 that this could only be explained on the basis that energy is transferred between radiation and matter in finite amounts, or *quanta*, which are inversely proportional to wavelength. *See* F13(1).

Quarks are hypothetical subnuclear particles recently postulated by theoretical physicists concerned with the so-called elementary particles. There are supposed to be three kinds, all carrying electrical charges which are fractions of those carried by familiar particles like electrons and protons. This and other special properties of quarks make them suitable for explaining the existence of the large number of other particles referred to on F14, 15. The physical existence of quarks may be demonstrated by experiment at any time and if this happens it will be an exciting truimph for speculative theoretical physics.

Quartering, in heraldry, is the disposition of various escutcheons or coats of arms in their proper " quarters " of the family shield, in such order as indicates the alliances with other families.

Quartermaster, a military officer charged with the provisioning and superintendence of soldiers in camp or barracks, and holding the equivalent rank to a lieutenant. The Quartermaster-General is an officer who presides over the provisioning department of the whole army. A Quartermaster in the Navy is a petty officer responsible to the Officer of the Watch; at sea for the correct steering of the ship and in harbour for the running of the ship's routine.

Quarto, a sheet of paper folded twice to make four leaves, or eight pages; usually abbreviated to " 4to."

Quartz is a common and usually colourless mineral, occurring both crystallised and massive. In

the first form it is in hexagonal prisms, terminating in pyramids. When pure its specific gravity is 2·66. It is one of the constituents of granite, gneiss, etc. Among the quartz varieties are *rock crystal* (colourless), *smoky quartz* (yellow or brown), *amethyst* (purple), *rose quartz* (pink), and *milky quartz* (white). Quartz veins in metamorphic rocks may yield rich deposits of gold. Mining for gold in the rock is termed quartz-mining.

Quasars, or in preferred terminology, quasi-stellar radio-sources, form a new class of astronomical object, first identified in the period 1960 to 1962. They have small size, *i.e.*, they are like stars not galaxies; they have enormous energy output, and are at vast distances. Many are strong sources of radio waves and fluctuate in intensity. Their nature and cosmological significance have presented the major astronomical problem of the 1960s. *See* F5.

Quaternary Deposits *or* **Post-Tertiary**, are the latest stratified rocks of the earth's crust, and include the Pleistocene ("Great Ice Age") and recent systems.

Queen Anne's Bounty, established by Queen Anne in 1704 for the augmentation of the maintenance of the poor clergy. Since April 1, 1948, Queen Anne's Bounty and the Ecclesiastical Commissioners ceased to exist and became embodied in the Church Commissioners for England.

Queen's (or **King's**) **Speech** is the speech prepared by the Government in consultation with the Queen and delivered by Her Majesty in person or by her deputy, at the opening or closing of a Parliamentary session.

Quicksilver. *See* Mercury.

Quince, a well-known hardy orchard tree, bearing fragrant, yellow, pear-shaped fruit. The correct botanical name for the Japanese quince or japonica is *Chaenomeles speciosa*. *See* T6.

Quinine, a vegetable alkaloid obtained from the bark of several trees of the *Cinchona* genus. It is colourless and extremely bitter. The drug, sulphate of quinine, is one of the most valuable medicines, forming a powerful tonic. It is antiperiodic, antipyretic, and antineuralgic. In cases of malaria it is the most efficacious remedy of natural origin known.

Quintal metrique, a French weight of 100 kilogrammes, or 220 lb, avoirdupois.

Quirinal, one of the seven hills of Rome.

Quisling, term which came into use during the second world war to denote traitor, collaborator, or fifth-columnist. After Vidkun Quisling, who became head of the puppet government after the German invasion of Norway in 1940.

Quorum, the number of members of any body or company necessary to be present at any meeting or commission before business can be transacted. Forty form a quorum in the House of Commons.

R

Rabbi, a Jewish term applied to specially ordained officials who pronounce upon questions of legal form and ritual, and also generally accorded to any Jewish scholar of eminence.

Rabbit. *See* Z17.

Raccoon, plantigrade carnivorous mammals common to the American continent. There are several species. The common Raccoon (*Procyon lotor*) is about 2 ft. long, with a bushy ringed tail and sharp snout. Its skin is valuable.

Race. In the old text-books anthropologists were much concerned with the differences between the various races of Man: they described the Black Man (Negro), the Yellow Man (Mongol), the Red Man (American Indian), the Brown Man (Indian), and the White Man (European). Those who study Man from this point of view further subdivide each group into others. Thus White Man may be divided into Nordic, Alpine, and Mediterranean; Black Man into Hamitic, Bushman, and so on. Each of these groups tends to have physical traits which its members hold in common, although, of course, there are no *pure* racial types. All existing races have been fairly thoroughly mixed. What, in view of recent experience, is really important, is that races or even nations do not have psychological traits—at least not *innate* traits. Anthropology dismisses all theories of a superior race as unscientific: there is not the slightest evidence that one race differs in any way from another in its psychological potentialities. Jews, Irish, Scots, Italians do differ (so do the inhabitants of Edinburgh and London): but their differences are due to their situation and not to anything inborn.

Raceme, an inflorescence in which the main stem bears stalked flowers, *e.g.*, lupin, foxglove. The youngest flowers are at the tip of this axis.

Radar. The basic principle of radar is very similar to that of sight. We switch on a light in the dark, and we *see* an object because the light waves are reflected from it and return to our eye, which is able to detect them. Similarly, the radar station *sees* an object because the invisible radio waves sent out from the transmitter are reflected from it and return to the receiver, which is able to detect them.

The utilisation of radio waves for the detection of reflecting surfaces began with the classical experiment of the late Sir Edward Appleton in 1925, which he conducted in order to demonstrate the existence of the Heaviside layer in the upper atmosphere. During the course of the last war developments took place which tremendously improved the methods and instruments used. As in the case of so many of the inventions primarily developed for the purpose of waging war, many useful applications have been found for radar in times of peace, and, in particular, it has proved of great service as an aid to aerial and marine navigation, and in meteorology and astronomy.

Radiation, energy emitted in the form of a beam of rays or waves, *e.g.*, acoustic (sound) radiation from a loudspeaker, radiant heat from a fire, β-radiation from a radioactive substance. The radiation of electromagnetic waves from a body depends on its temperature, the amount of energy radiated per second being proportional to the fourth power of the absolute temperature. The hotter the body, the shorter the wavelengths of the radiation; thus the colour of a glowing body depends on its temperature. Of paramount importance to us is radiation from the sun. Amongst other radiations, the sun sends ultra-violet, visible, and infra-red (heat) waves. The principal gases of the atmosphere are transparent to practically all of the solar and sky radiation and also that which the earth re-transmits to space. Carbon dioxide and water vapour, however, strongly absorb certain types, the latter, as clouds, playing an important rôle in regulating the temperature of the globe. The cooling of the ground on a clear night is a result of the outgoing long-wave radiation exceeding that coming down from the sky; at sunrise cooling ceases as the incoming radiation becomes sufficient to compensate for the loss of heat.

Radiation, Cosmic. *See* F3(2).

Radio. The theory of electromagnetic waves—of which the radio wave is one—was originated by the British physicist James Clerk Maxwell (F12). He showed that both electrical and optical phenomena in space are essentially similar in character, and that the waves if short in wavelength are those of light, and if of longer wavelength those of radio waves. Heinrich Hertz made many useful discoveries about the waves themselves, and about their behaviour under differing conditions, and also about the apparatus for producing them. Marconi developed the use of radio waves as a practical means of communication.

Radio methods are vital for the transmission of observed data from space vehicles back to earth, a process known as "telemetering." This is done by converting the observations into electrical pulses which actuate a suitable radio transmitter so that it radiates a signal, in coded form, which can be received at a ground station and decoded. The transmission of such a signal can also be remotely controlled by means of signals from the earth. Photographic and television techniques may also be employed for obtaining the desired information and sending it back to earth, as in the case of the Russian picture of the reverse side of the moon and the American pictures of the lunar surface. The information may be stored within the spacecraft for a time, and

then, upon receipt of a particular radio signal from the earth transmitted by the spacecraft at a time convenient for its reception. Soviet scientists, by a special technique, were able in the case of their *Venus IV* probe (Oct. 1967) to parachute an instrumented canister from the spacecraft so that it could descend slowly to the surface of the planet—a feat described by Sir Bernard Lovell, who was recording the enterprise at Jodrell Bank, as "an experiment of classic elegance." *See also* **Radio Astronomy, Telemetry.**

Radioactivity is the spontaneous transformation of atomic nuclei, accompanied by the emission of ionising radiations. It was discovered in 1896 by Becquerel, who noticed that salts containing uranium sent off radiations which, like X-rays, can blacken a photographic plate. Two years later Marie and Pierre Curie discovered several new chemical elements which possessed the same property, but many times more intense than uranium, the most important of these was radium. Shortly afterwards it was established, mainly by Rutherford, that three types of radiations called α-, β-, and γ-rays, are emitted from radioactive substances. It was also Rutherford who, jointly with Soddy, deduced that the emission of the radiations is associated with the spontaneous disintegration of atoms which result in the transformation of one radioactive substance into another. A series of such transformations ends when a stable element is produced. All of the heavy radioactive elements can be arranged in three radioactive series, called, the uranium, thorium, and actinium series. Initially, radioactivity was thought to be a property confined only to a few elements occurring in nature. In 1934, however, Irene and Frederick Joliot-Curie discovered that ordinary elements can be transformed into radioactive forms by subjecting them to bombardment with α-particles. Following this, it was found that beams of other fast particles produced in accelerators can also render ordinary substances radioactive. Nowadays it is known that radioactivity is a general property of matter: any chemical element can be produced in one or more radioactive forms, or isotopes. *See* **F11.**

Radio Astronomy.—The science of radio astronomy makes use of radio apparatus and techniques for the observation of events occurring in far distant parts of the universe, and, in so doing, is able to enlarge upon the observational field of optical astronomy in a remarkable way. By means of radio telescopes it is possible to observe parts of the universe so far distant that the radio waves received have taken thousands of millions of years to travel from their source to the earth, and thus to observe happenings which may have occurred near the beginning of the history of the universe.

There are two main types of radio telescope. The first, known as the interferometer, uses aerials spaced at large distances so as to cover a wide tract of ground. This has a high "resolution" but suffers from the disadvantage that it can "observe" only a very limited area of the sky overhead, as the earth turns upon its axis. The second, and "steerable," type, is that of the radio telescope at Jodrell Bank, Cheshire, which consists of an enormous concave metal bowl, with the radio aerials at its centre. This, though it has a lower "resolution," can be directed or "steered" on to any part of the sky which is above the horizon, and so can undertake a much more comprehensive observational programme. It can be used either to receive radio waves coming from desired sources or to transmit them and then pick up the echo from, for example, the moon or a planet, as in radar.

One source of radio waves which can be detected by radio telescopes is our own sun, whose behaviour under "quiet" and "abnormal" conditions can be observed in this way. Some of the planets also appear to emit radio waves from parts of their surface. But much more remarkable are the waves which are received from quasi-stellar radio-sources or quasars (*q.v.*).

Radiosonde, a weather station in miniature carried aloft by a free balloon to heights normally in the neighbourhood of 10 miles. Signals representative of values of atmospheric pressure, temperature and humidity are transmitted simultaneously by radio to receiving apparatus on the ground. The position of the balloon at any instant can be determined by radar, enabling the speed and direction of the upper winds to be deduced.

Radium, a radioactive metal, symbol Ra, discovered by Marie and Pierre Curie in 1898. Atomic weight 226. The Radium Institute, founded and equipped by Lord Iveagh and Sir Ernest Cassel, was opened in 1911 for the treatment of patients and research into the effect of radium on the human system. Radiotherapy (use of X-rays from radium) is used in the treatment of cancer.

Radon, a radioactive gaseous element, symbol Rn, formed by radioactive decay of radium. Its discovery completed the series of elements known as the inert (or rare) gases.

Rail, a well-known genus of the *Rallidae* family, including the Water Rail, the Moorhen, Corncrake, and Coot, resident in the British Isles.

Railways in Britain. *See* **British Rail.**

Rain. When moist air rises into lower temperatures and becomes saturated, condensation takes place on the numerous hygroscopic particles present in the atmosphere. If the temperature is above freezing a cloud of small droplets is formed, and as the air continues to rise they grow in size until the weight is great enough to make them fall to the earth as rain. The formation of large raindrops has been attributed to coagulation of smaller drops of different sizes, while another mechanism depends upon the presence in the cloud of ice crystals as well as water drops. In temperate latitudes snowflakes falling from the freezing level melt in the warmer air below, producing large raindrops which grow in their flight through the lower part of the cloud.

Rainbow, a beautiful colour effect visible to an observer with back to the sun and facing a rain shower, caused by the refraction and reflection of sunlight in minute water-droplets in the air. From high in the air it would be possible to see a rainbow as a complete circle, but from the ground the most that can be seen is a semicircle when the sun is just on the horizon; the higher the sun is, the smaller the arc of the rainbow. When conditions are suitable two bows are seen, the secondary with the colours of the spectrum reversed. The colours of the rainbow are seven: red, orange, yellow, green, blue, indigo, and violet—the colours of the spectrum. *See also* **Aurora.**

Raingauge, an instrument consisting of a deep metal funnel whose stem dips into a graduated glass jar from which the depth of the rain water collected can be read. Continuous records of rainfall are provided by self-registering instruments.

Rain Making is a facility long desired by mankind, especially in the drought-ridden regions, and attempted throughout history by numerous non-scientific means. Since the Second World War it has been proved that clouds can sometimes be made to rain or snow by dropping into them from an aeroplane very cold particles of solid carbon dioxide or certain chemicals. This makes the moisture of the cloud form tiny ice crystals which grow big and finally fall out of the cloud. The process is quite complicated and not fully understood and the practical exploitation is somewhat chancy at present, but experiments have been made in many countries and the United States has a considerable programme of study. As well as scientific there are commercial and legal problems; premature commercial exploitation has resulted in disillusionment in some cases.

Rambouillet, a royal French château (14th cent., rebuilt 18th cent.), near Paris, and the official summer residence of the President of the French Republic. Also the name of the famous literary salon of the Marquise de Rambouillet (1588–1665).

Rampant, in heraldry, is a term applied to the figure of an animal with forelegs elevated, the dexter uppermost. When the animal is shown side-faced it is *rampant displayed,* when full-face, *rampant guardant;* when looking back,

rampant reguardant; and when in sitting position *rampant sejant*.

Rape, a cruciferous plant yielding coleseed or rapeseed, extensively grown in all parts of Europe and India. Rape oil or colza is made from the seeds, and the leaves and refuse are used for sheep-food. Rape oil is a yellow, thick oil, of considerable commercial importance as a lubricant and for other purposes. It was at one time much used as an illuminant.

Rare Gases (also called **Inert Gases**). These are a group of elements which are chemically inert, comprising helium, neon, argon, krypton, xenon, and radon. Cavendish in 1785 noticed that there was in air some gas which was not oxygen, nitrogen, or carbon dioxide, but it was not until 1894 that the first of the rare gases was found by Rayleigh and Ramsay. This they called argon (inert). After the discovery of helium in 1895 Kayser, Rayleigh and Travers soon isolated the other gases except radon, which was later detected as a radioactive decay product of radium. Some of these inert gases are used to fill electric-light bulbs, and helium is used in balloons, since it is very light.

Rat, a well-known order of rodent embracing many species. The *brown rat* appeared in Europe early in the 18th cent., coming from the East and entering by way of Russia; now it is widespread and met with in Britain and all parts of the Continent. The *black rat*, which was the common rat before the arrival of the brown species, is a smaller animal and now comparatively scarce. There are numerous other kinds, all of them gross feeders, and existing in such numbers in many places as to constitute a pest. *See* **Z13**.

Rationalism. *See* **J37**.

Rattlesnake, venomous snakes which obtain their name from the possession of a rattle in the end of their tail, consisting of horny pieces so arranged that when vibrated they make a rattling sound. They are only found in N. and S. America.

Raven, a black-plumaged bird of the crow family, with raucous voice and massive bill. Occurs in many parts of Europe, Asia, and America. Ravens are easily domesticated and form interesting pets. Dickens had one which he described in *Barnaby Rudge*.

Ray, fish with a very flat body and broad and fleshy pectoral fins, related to the sharks. There are about 140 species. In Britain they are generally called *skate*.

Razorbill, a sea-bird of the auk family, having a high, furrowed bill and black-and-white plumage. It inhabits rocky cliffs during the breeding season, and at other times is mostly out on the open sea.

Realism is a vague term. For its use in philosophy *see* **J38(1)**. As a movement in art it can be said to have started with Gustave Courbet in the mid-19th cent. in his revolt against the classicism of Ingres and the romanticism of Delacroix. He was a man of strong radical views, and like Zola, Balzac, and Flaubert in literature, turned to the actuality of everyday life, recording it with frankness and vigour. Some young English painters, notably Bratby, of the "kitchen sink" school, practise what some describe as social realism. In another sense, realism is an attitude concerned with interpreting the essential nature of the subject, revealing truths hidden by the accidentals of ordinary visual appearance. Thus form becomes more significant than content. Beginning with Cézanne and Van Gogh this trend passes on to Cubist and Abstract painting.

Record Office, in Chancery Lane, London, the place where the Public Records of England are preserved, including Domesday Book, the various Rolls of Charters, and important historical documents.

Rectifier, an electrical device which will allow electric current to flow in one direction only and can therefore be used for turning alternating current into direct current. Since electricity is usually supplied in alternating form and frequently needed in direct form, rectifiers are of very common use both in industry and the home, for example in radio and television and for battery chargers. Rectifying properties are possessed by a number of different devices, one of which is a thermionic diode (*see* **Valve**). Very large valves filled with mercury vapour are often used for rectifying heavy currents for industrial purposes. Many other rectifiers use semiconductors in close contact with metals or with other semiconductors because such junctions have the property of passing electric current easily only in one direction.

Recusants, people who refused to attend the Anglican Church or to acknowledge the ecclesiastical supremacy of the Crown in the 16th and 17th cent.

Red Crag, the name given to a strata of gravel or sand, containing certain fossil mollusc deposits, found on the Suffolk and Norfolk coasts.

Red Cross. *See* **Geneva Convention**.

Red-Letter Day, a Church festival day indicated in the Prayer Book by red letters, now a popular term for any day of special significance.

Redstart, a small bird of the Thrush family of handsome plumage and striking song. Two species visit Great Britain; the Common Redstart, with bright chestnut rump and tail, white forehead, and black cheeks, favours wooded country, and the Black Redstart, with black breast and throat, chestnut tail and white wing bars, prefers rocky ground or bombed buildings, and has recently begun to breed in S. England.

Redwing, a bird of the Thrush family which finds its way to this country for the winter. Resembles the song thrush, but distinguished by smaller size, buffish-white eye-stripe, chestnut flanks and underwings. It has bred in Scotland and on Fair Isle.

Redwood *or* **Sequoia**. This genus of coniferous tree comprises two species of Redwoods occurring in N.W. America. Specimens of one species, the Giant Redwood, reach a height of over 300 ft. and a thickness of 36 ft. The age of the largest, the General Sherman tree, is put at 3,500 years.

Referendum and Initiative, two methods by which the wishes of electors may be expressed with regard to proposed legislation. It is developed to the highest extent in Switzerland. In a referendum some specific matter is referred to the electors. The Initiative is the means by which electors can compel their representatives to consider a specific issue. After consideration by the legislature it must then be submitted to the electorate for approval (*i.e.*, a referendum). Gen. de Gaulle has made use of the referendum in seeking the consent of the French nation for his policies. In a democracy a referendum should be preceded by a programme of education and public debate.

Reformation. *See* **J38, 25**.

Reform Bills. The principal Bills have been passed for the reform of the Parliamentary franchise. The first was the great Reform Bill of 1832, introduced by Lord John Russell and enacted under the Whig administration of Lord Grey. In addition to a sweeping redistribution of seats, this Act greatly extended the franchise but still left many people without the right to vote. The second Bill, passed by Disraeli in 1867, by giving the vote to workers in towns, established household suffrage. A third Bill, passed in 1884 under a Gladstone ministry, removed the distinction between borough and county franchises, enfranchised agricultural workers, and thus gave the vote to all men over 21. Women had to wait until 1918 to get the vote at the age of 30. The Representation of the People (Equal Franchise) Act, 1928, gave them the right to be registered as Parliamentary electors at the age of 21, thus making England into a true democracy. The Representation of the People Act, 1948, abolished the representation of the universities and the separate representation of the City of London and the business-premises vote.

Refraction. The change of direction which light rays and other rays undergo when passing from one medium to another. The phenomenon is due to the fact that in different media light (and other forms of radiation) has different speeds.

Refractory, a substance capable of standing high temperatures and therefore useful for making furnaces and allied apparatus. Some insulating refractories are fire-clay, alumina, porcelain, carborundum, graphite, and silica. Some refractory metals are platinum, molybdenum,

tungsten, tantalum, and the alloys nichrome, chromel, alumel.

Reindeer, a genus of deer horned in both sexes, occurring only in northerly regions. It has an average height of 4 ft. 6 in., is very fleet of foot, and the Laplanders utilise it for draught purposes and for food.

Relativity. The laws of relativity have been substantially proved and have revolutionised our ideas as to the nature of space, time, matter, and energy and forced us to think along new lines. In 1949 a new theory by Einstein was announced which sets forth in a series of equations the laws governing both gravitation and electromagnetism, which is said to bridge the gap that separates the universe of the stars and galaxies and the universe of the atom. At present the one is explained by relativity, and the other rests on the quantum theory. *See* F14.

Relief in sculpture is of three kinds—high relief (*alto-relievo*), in which the figures stand out to the extent of one-half of their natural proportions, low-relief (*basso-relievo*) when the figures project but slightly; and middle-relief (*mezzo-relievo*), when the projection is intermediate.

Renaissance. *See* J38.

Republican Party of the United States was born by the fusion in 1854 of the group who called themselves National Republicans, having split from the Democrats over tariffs in 1825, and the northern Democrats, both of them being opposed to slavery. It came to power on Abraham Lincoln becoming President in 1861 and remained in power (with the exception of four Administrations) until 1912. On coming to power in 1920 the Republicans withheld the U.S. ratification of the Treaty of Versailles, which had been negotiated by Woodrow Wilson. It was defeated in 1932 largely as a result of the economic depression. Once isolationist in foreign policy, the Party now advocates an active policy, especially in Asia. Except for the Eisenhower administration (1953–61), the Republican Party has not held power since 1933, Nixon narrowly failing to defeat Kennedy in 1960, and Goldwater being decisively beaten by Lyndon Johnson in 1964. The symbol of the party is an elephant. *See also* C22(1).

Requiem. Properly a mass for the dead, the term is extended to cover musical settings by Palestrina, Mozart, Verdi, and others.

Reredos, the ornamental screen at the back of the altar or communion table. It is often of a highly decorative character and is an architectural feature in many churches in Spain. Other examples are to be found in the following cathedrals in England: Southwark, St. Albans, Winchester, Durham, and Liverpool.

Resins, natural resins are vegetable compounds largely employed in the industrial arts. They comprise india-rubber, amber, mastic, copal, etc. "Synthetic resins" is a term sometimes used as a synonym for "plastics."

Reuter, an international news agency, organised since 1941 as a trust and owned by the newspapers of Britain, Australia, and New Zealand, founded by Baron J. de Reuter in 1849.

Rhea, a large flightless bird, the "ostrich" of S. America, distinguished from the ostrich proper by smaller size, longer beak, larger wings, no tail and 3 toes instead of 2. There are 2 species.

Rhesus Factor. *See* Index to Section P.

Rhinoceros, a large hoofed quadruped, of which there are nine existing species native to the river and marsh regions of Africa, India, Borneo, and Java. It is remarkable for its thick hide and upturned snout, from which springs a long horn. The white rhinoceros, which is scarce, is the biggest species, attaining a length of 10–12 ft. and a height of from 5 to 6 ft.

Rhodium, a metallic element, symbol Rh, discovered by Wollaston in 1804. It is found in platinum ores in small amounts, generally less than 2 per cent. With platinum it gives a very hard and durable alloy. It is also used, instead of silver, in putting the reflecting layer on a mirror.

Rialto, a famous bridge that crosses the Grand Canal at Venice, and dates from 1591.

Ribbon Fish *or* **Garfish**, a deep-sea fish, deriving its name from its ribbon-like shape. Though many feet in length, it is only an inch or two thick. The ribbon fish is rarely met with because of its habitat, and most of what is known about it has been learnt from specimens occasionally cast ashore during storms.

Rice, a grain-yielding grass, of which thousands of strains are known today, extensively cultivated in China, India, and certain parts of America, and forming the main food of the peoples of China, Japan, India, and the Malayan regions. Some 95 per cent. of the world's rice is produced and consumed in the Orient. The grain with the husk is known as "paddy." Arrack, an alcoholic liquor, is made from fermented rice seeds.

Rime, a crystalline deposit of ice formed on objects exposed to wet fog at the same time as frost.

Rinderpest *or* **Cattle Plague**, is a highly contagious disease affecting cattle, sheep, and other ruminants. In Europe the disease has been eradicated, but it was formerly very widespread and caused great loss of life amongst cattle. The disease is caused by a filtrable virus, and is attended by fever and congestion of the mucous membranes.

Ring Dove *or* **Wood Pigeon**, a blue-grey bird, distinguished from other pigeons by larger size (16 in.), white wing-bar, glossy green-and-purple neck, and white half-collar. It is very common in Britain

Rituale, the book of rites used in the Roman Catholic Church for the administration of certain sacraments and other church ceremonies. Like the Roman breviary, it dates in its present form from the Council of Trent.

RNA. (Ribonucleic Acid). *See* Nucleic Acids.

Roaring Forties, name applied to the prevailing westerly winds over the oceans in the temperate latitudes of the Southern Hemisphere.

Robin (or Redbreast). A small bird with olive-brown upper parts and orange-red forehead, throat, and breast; both sexes look alike. The young are speckled, lacking the red breast. Its wide European distribution includes the British Isles, where it is the national bird. It also occurs in N. Africa and W. Asia. The nest is placed in a great variety of situations including holes in banks, trees, and walls; in sheds, amongst ivy, and sometimes in old tins. Nesting-boxes are readily adopted, but care should be taken to ensure that the entrance-hole is small enough to exclude starlings. Robins are pugnacious and defend their territories with vigour. Their attractive appearance, trustful disposition, engaging ways, and sweet song make them extremely popular. The name robin is also applied to a number of very different birds, one of which, the American Robin, occasionally wanders to Europe.

Rock Dove, the grey pigeon *Columba livia* of Europe and Asia, ancestor of the domestic pigeons as Darwin was the first to show.

Rockets for use in war were first studied by Sir William Congreve early in the 19th cent., and proved very destructive in siege operations. They were invented by the Chinese as long ago as the 11th cent. The Germans devised the huge V2 rocket, carrying a ton of explosive, which was used near the end of the war to bombard London. Rockets are propelled by the burning of fuel (*e.g.*, oxygen or nitric acid), the exhaust, being ejected at high velocity, thrusts the rocket forward. For the study of the properties of the atmosphere vertical sounding rockets are used. Rocket flight in outer space was first presented as practicable by the Russian rocket expert, K. E. Tsiolkovsky, in 1903. The provision of sufficient launching velocity involves the use of rocket motors with adequate thrust. To launch a satellite into an orbit circulating within a few hundred miles of the surface a velocity of 18,000 m.p.h. must be imparted. This may be done by using a multi-stage launching system. When the first-stage motor has burned out it drops off, so that, when the second-stage motor ignites, it does not have to support the weight of the first-stage, and so on. If the launching velocity is increased to 25,000 m.p.h. the vehicle will not return to the neighbourhood of the earth but pass out of the range of the earth's gravitational pull completely. Unless the launching velocity reaches 100,000 m.p.h. it will not escape from the sun and will become an artificial planet. *See also* Space Research.

Rock Magnetism. The study of naturally occurring magnetism in rocks is a subject which has gained considerable importance in recent years.

There are two principal reasons for this. One is that this so-called "fossilised magnetism" may be able to tell us more about the past history of the earth's magnetic field. The other is that after many years of heated dispute between geologists rock magnetism promises to settle once and for all the controversy as to whether or not the continents have changed their relative positions in past times (continental drift theory (*q.v.*)). This branch of geophysical research, in addition to its academic interest, may well have important economic consequences. It might, for instance, become possible to locate mineral deposits once accumulated under special conditions at certain latitudes but now drifted to other places. Salt and similar deposits formed by the continuous evaporation of solutions in hot countries are one example; oil may well be another. There has been a *steady* change in rock magnetisation direction with geological time. It is now known with some accuracy that the most recent reversal took place 700,000 years ago. It has been found that the older the rock, the farther removed is its fossil magnetisation from the present field. *See also* F57(1).

Rococo, an architectural style which was, in effect, the final stage of Baroque (*q.v.*). The name first came into use about 1830 to describe the period 1720–70 and means "shell-shaped" (French *Rocaille*), since the shell was a favourite motif in Rococo ornamentation. About the beginning of the early 18th cent. the heavy older type of Baroque began to show even less restraint than had characterised it in the past; it became still less utilitarian, and showed a kind of playful lighthearted vitality which manifested itself in a wealth of ornamental invention. Baroque was flamboyant and robust, Rococo frivolous. In architecture Rococo is naturally found in those areas where the Baroque had flourished, *i.e.*, Munich, Prague, Vienna, and Dresden. In painting, the best expressions of Rococo are to be seen in the works of the French painters Watteau (d. 1721), Boucher (d. 1770), a favourite of Mme de Pompadour, and famous as a decorator of boudoirs, and Fragonard (d. 1806). (As in the case of Baroque, it was typical of Rococo that the sculpture, painting, and the decorative arts of a building all expressed the same spirit.)

Roe, popular name given to organs in fish which produce eggs and sperms. "Hard roe" is that of the female and consists of eggs; that of the male is the soft roe or milt.

Roebuck, a deer that was formerly common in the forests and parks of Britain, but is now only found at large in the northern parts of Scotland.

Roller, a tropical Old World bird of the *Coraciidae* family, related to the hoopoe, kingfisher and bee-eater, of strikingly brilliant blue, chestnut, greenish-blue plumage. There are fifteen species, one of which breeds in the far north and visits the British Isles on its migrations to and from its winter quarters in Africa.

Romanesque Architecture, prevailed throughout Europe from the mid-10th to the 13th cent., and implies an art which developed from that of the Romans. Notable in Romanesque style were the rounded arch and masonry vaulting. Romanesque led to the graceful and more complex Gothic (*q.v.*). The Italians never regarded Gothic highly and Romanesque churches, generally based on the basilican plan (oblong with double colonnades and a semi-circular apse at the end), continued to be built there until the beginning of the 15th cent. Some of the best examples can be seen at Pisa (11th cent.), Florence (San Miniato, 1013), Lucca (12th cent.), and Milan (the 12th cent. San Ambrogio, most famous of all). In Germany Romanesque architecture flourished longer than in France or England; the most famous churches are in the valley of the Rhine, at Cologne (completely destroyed during the second world war), Mainz and Speyer. In France Romanesque churches are found in Burgundy, Provence and Normandy. For English Romanesque *see* Norman Architecture.

Roman Roads, highways constructed by the Romans. They were of great durability. The best known British roads were Ermine Street (London, Lincoln, York), Fosse Way (Lincoln through Leicester, Cirencester, Bath, Exeter), Watling Street (London to Shropshire).

Romanticism, a term for a movement in the arts—whether in music, painting, sculpture or literature—which seeks to give expression to the artist's feelings about his subject rather than to be concerned with form or reality. The romantic view is that art is nature seen through a temperament; the realist view is that art is a slice of life. In painting Delacroix (1798–1863) is the romantic artist par excellence with his uncontrolled expression of the passions and love of the exotic. In literature the Romantic movement reached its finest form in the works of Goethe, Schiller, and Heine; in the poetry of Byron, Keats, Wordsworth, Shelley and Blake; and in the writings of Victor Hugo. Since Romanticism is partly a matter of temperament in the artist just as Classicism is, it may be found at all times and places, although whether or not it becomes predominent depends on contemporary taste. Cubism, for example, with its attention to form is classical, whereas Surrealism with its attention to content is romantic. *See also* Romantic Movement. J39.

Roman Walls were built as frontier barriers under the Emperors Hadrian (76–138) and Antoninus Pius (86–161). Hadrian's works, linking Wallsend-on-Tyne with Bowness-on-Solway, comprised a twenty-foot stone wall, ditches, turrets, "milecastles," fortresses, and a double earthen mound, or "Vallum." Impressive ruins are still visible at Chesters and Housesteads. Antoninus Pius, Hadrian's successor, made a further advance, but the turf wall which he built between Forth and Clyde was soon abandoned. Septimius Severus (146–211) restored Hadrian's wall after the assassination of Commodus and the subsequent civil wars. It was finally abandoned between 380 and 390.

Rood Screen, an ornamental partition, separating the choir from the nave in a church, and supporting a crucifix or rood.

Rook, a member of the crow family, abounding in most parts of the British Isles and found in Europe, Asia, and N. Africa. It has been introduced into New Zealand. Rooks usually nest in colonies in tall trees. They are highly intelligent birds, and their ways have long been the subject of much careful study.

Rosary, a circular chain of beads, used by Catholics when reciting a particular form of sustained prayer. Each bead represents an entire prayer, and the combined prayers constitute the Rosary.

Roses, Wars of the (1455–85), between the rival houses of York and Lancaster, for the possession of the English crown, began in the reign of Henry VI. and ended with the death of Richard III. on Bosworth Field. The emblem or badge of the Lancastrians was the red rose and of the Yorkists the white rose. All rivalry between the Roses ended by the marriage of Henry VII., the Lancastrian, with the Princess Elizabeth, daughter of Edward IV., the Yorkist.

Rosetta Stone, discovered in 1799 by the French at Rosetta in Egypt, and deposited in the British Museum. It is a piece of black basalt about 3 ft. long, and contains a decree of the Egyptian priests of Ptolemy V. Epiphanes (205–181 B.C.) in (1) hieroglyphics, (2) demotic, and (3) Greek characters. It was by means of the three different inscriptions on the same stone that hieroglyphic writing was first able to be deciphered.

Rotten Row, a corruption of *route de roi* (king's drive), the famous riding resort in Hyde Park.

Rouge et Noir, a well-known gambling card game played on a table divided into two sections and marked with two black and two red lozenges. Any number of players can take part, and the money is staked on the red or black spaces. The cards are dealt out, first to Noir, until the pips aggregate more than 30; then in like manner to the Rouge, and the packet coming nearest to 31 wins the stakes.

Roulette, a gambling game played on a table carrying a revolving wheel divided into 37 compartments. Each compartment bears a number, 0 (zero) and 1 to 36. The numbers are mixed and do not follow any particular order. Of these 37 numbers 18 are black and 18 are red, whereas zero is green. The players stake their money on any compartment, colour, or combination of numbers they please.

The wheel is whirled round and a ball is set rolling in the opposite direction, dropping finally into one of the compartments, thus deciding the winning number and colour.

Roundhead. In the reign of Charles I. and later, a Puritan or member of the Parliamentary party who wore his hair cut short. It was originally a term of derision applied by the Royalists, who usually wore ringlets.

Round Towers, high circular towers with conical roof and massive masonry walls, built during the early Middle Ages (c. 10th cent.) It is believed that they served as refugees and lookouts. These buildings are numerous in Ireland, and three remain in Scotland, including that at Brechin which is attached to the church.

Royal Academy of Arts was founded in London in 1768, under the patronage of George III. The early exhibitions of the Academy were held first in Pall Mall, and after in Somerset House, where the exhibitions continued to be held until 1836, when the National Gallery being built, the Academy moved its quarters to that building. In 1869 the present Royal Academy at Burlington House was opened. The Academy numbers 58 R.A.s and about 30 A.R.A.s. List of presidents: Sir Joshua Reynolds (1768), Benjamin West (1792), James Wyatt (1805), B. West (1806), Sir Thomas Lawrence (1820), Sir M. A. Shee (1830), Sir C. Eastlake (1850), Sir F. Grant (1866), Lord Leighton (1878), Sir J. E. Millais (1896), Sir E. J. Poynter (1896), Sir Aston Webb (1919), Sir F. Dicksee (1924), Sir William Llewellyn (1928), Sir E. Lutyens (1938), Sir A. J. Munnings (1944), Sir Gerald F. Kelly (1949), Sir A. E. Richardson (1954), Sir Charles Wheeler (1956) and Walter T. Monnington (1966). The Academy holds an exhibition of pictures, statuary, and architectural designs every summer.

Royal Hospital, Chelsea, built by Wren, was opened in 1694 as an institution for invalid soldiers.

Royal Institution, established 1799, and incorporated by Royal Charter in 1800 for " the promotion, extension, and diffusion of Science and of Useful Knowledge." It was in the building of the Institution that Faraday conducted his experiments. It supports four professors: natural philosophy, astronomy, chemistry, and physiology. Famous also for its Christmas lectures designed for a juvenile audience.

Royal Society was founded in 1660 and incorporated by Royal Charter in 1662, Viscount Brouncker being named the first president. Its *Philosophical Transactions* date from 1665. Among those who served as president of the Royal Society are Sir Christopher Wren, Pepys, Sir Isaac Newton, Sir Joseph Banks, Sir Humphry Davy, Prof. T. H. Huxley, Lord Rayleigh, Sir Archibald Geikie, Sir J. J. Thomson, O.M., Prof. Sir C. S. Sherrington, O.M., G.B.E., Lord Rutherford, O.M., Sir William Henry Bragg, O.M., Sir Henry Dale, O.M., Sir Robert Robinson, O.M., Lord Adrian, O.M., Sir Cyril Hinshelwood, O.M., Lord Florey, O.M., and Prof. P.M.S. Blackett O.M. (1966).

Rubber, produced from the juice of certain trees and shrubs of tropical countries, is in such extensive demand now for tyres and other purposes that rubber plantations have been established in almost every part of the world where rubber can be grown, particularly in Malaysia and Indonesia. The best kinds come from the Amazon valley. In recent years great advances have been made in the production of synthetic rubber.

Rubicon, a small river falling into the Adriatic, and forming one of the Italian boundaries, the crossing of which anciently involved decisive action and constituted a declaration of war. Thus the phrase " crossing the Rubicon ", denoting an act from which there is no withdrawal.

Rubidium, a metallic element, symbol Rb, most closely resembling potassium. It is silver-white and very soft, and was discovered in 1861 by Bunsen and Kirchoff, using the spectroscope. It is rare, occurring in small amounts in the mica called lepidolite and in potash salts of the Strassfurt deposits in Germany.

Rubrics are instructions in regard to the ceremonies of the Church, appearing in red in the Prayer Book.

Ruby is a deep red variety of Corundum (aluminium oxide): one of the most valued of precious stones. Burma yields some of the finest, and rubies of inferior colour are found in Siam, Ceylon, South Africa, and Brazil.

Rudd, a fresh-water fish of wide distribution, plentiful in the rivers of Britain, and found in most other parts of Europe, also in Asia Minor. It is of a reddish-gold colour, with a greenish-blue beard.

Ruff, a bird related to the common sandpiper, at one time common in the Fen districts. The males have a ruff of feathers round the neck in the breeding season. The female is the Reeve.

Ruffe *or* **Pope,** a small fresh-water fish common in most parts of central Europe, and similar in appearance to the ordinary perch. It is found in British rivers.

" Rule, Britannia ! " the national sea-song of England, was written by James Thomson (1700–48), the author of the " Seasons," and set to music by Dr. Arne about 1740. The poet's words were " Britannia, rule the waves! " but it is usually rendered " Britannia rules the waves."

Rum, an ardent spirit distilled from molasses, and containing from 40 to 50 per cent. of alcohol. It is chiefly manufactured in the West Indies, and derives its special flavour from a volatile oil.

Ruminants, animals that chew the cud, being provided with a compartmented stomach, enabling them to swallow food, and later to bring it back to the mouth for mastication; *e.g.*, sheep, goats, oxen, etc. While in the rumen, or storage compartment, some digestion of food, especially cellulose, takes place by bacterial action.

Runcible spoon, a kind of fork used for pickles having three broad prongs. The word was used by Edward Lear about 1870 as a nonsense word and may be derived from *Rouncival* meaning large or huge from the bones said to have been dug up at *Roncesvalles* where Roland fell. Rouncival peas are the large peas called " marrowfats."

Runes, certain characters of an alphabet found in inscriptions in the Germanic languages, discovered cut upon stone monuments and implements found in many parts of Europe, including England. The runic alphabet originally had 24 letters. Scholars agree that some of the runes derive from Greek and others from Latin.

Ruskin College, the first residential college for working people, founded at Oxford in 1899 by Mr. Walter Vrooman, an American.

Rusts, parasitic fungi, some common species of which have reddish spores which in a mass have a rusty appearance. A well-known species is the Wheat Rust (*Puccinia graminis*), which has an alternative host in the barberry.

Ruthenium, a greyish-white metallic element, symbol Ru, discovered by Claus in 1845. It is harder and more brittle than platinum, in whose ores it occurs.

Rutile, mineral titanium dioxide. It is found in many igneous rocks, and in gneisses and schists. Its commonest colour is reddish-brown.

S

Sabaoth, a Hebrew word, meaning an army or host, and applied sometimes to the Supreme Being, *e.g.*, " the Lord of Hosts " (Rom. ix. 29).

Sabbath and Sunday. Sunday, or the Lord's Day, is the first day of the week in the Christian year. It was substituted for the Jewish Sabbath in the 1st cent. A.D. as the Christian day of worship in commemoration of the Resurrection. The Sabbath, in the Jewish system, was the last day of the week (Saturday in the Christian calendar), designated as the day of religious rest in the fourth commandment of the Decalogue. It was the Puritans at the time of the Reformation who applied the term Sabbath to the Christian Sunday and the two terms have been used indiscriminately ever since.

Sabbatical Year was instituted by the Jews in ancient times for the purpose of giving the soil a rest from cultivation. This was every seventh year. In universities a sabbatical year is a year of absence from duty for the purpose of study and travel, granted to professors at certain intervals.

Sable, a furred mammal of the weasel family

mainly inhabiting Siberia. It is bright brown in colour, and has a long, bushy tail. American sable is a marten.

Saccharin, a white crystalline solid manufactured from toluene, 550 times as sweet as cane sugar. It is used as a sweetening agent; as a substitute for sugar when sugar is forbidden, as in certain diseases, or when there is a shortage. It has no value as a food.

Sack, the white dry wines of Spain and Madeira, canary being the most popular.

Safety Lamp, as used in coal mines, was invented by Sir Humphry Davy in 1816. The flame is enclosed in a cage of fine-meshed wire which allows air to enter and promote burning, but conducts away the heat generated in combustion so that no product of combustion escapes at a temperature high enough to ignite explosive gases in the mine.

Sainfoin, a widely cultivated forage plant, especially adapted for sheep. It is of strong, leafy growth and bears bright red flowers. It belongs to the same family of flowering plants as peas and beans.

St. Elmo's Fire, a glowing brush-like discharge of electricity which takes place from sharp-pointed objects on mountains or the masts of ships exposed to the intense electric fields of thunder-clouds.

Salamanders are amphibia superficially resembling lizards, from which they differ in having a moist skin and no scales.

Salic Law was probably instituted in France in the 5th cent. for the purpose of excluding females from inheriting the Crown. The Bourbons introduced the same law into Spain, but this was abolished by decree in 1830 to enable Isabella II. to succeed.

Salicylic Acid can be obtained from the flowers of the meadow-sweet, and from oil of wintergreen, but is now usually prepared by the action of carbon dioxide on sodium phenate under pressure. The acid is then prepared from the sodium salicylate. It is used as an antiseptic and has been used as a food preservative. Aspirin is a derivative of salicylic acid.

Salmon, a familiar fish notable for its habit of ascending rivers from the sea in the autumn and there depositing its spawn, not returning to the sea until the early spring. The salmon fishing season varies from place to place.

Saltpetre. *See* **Nitre.**

Salvarsan, the organic arsenical compound arsphenamine, which Ehrlich discovered was able to kill inside the human body the spirochæte germ that causes syphilis. Also known as "606." It has been superseded by neosalvarsan.

Salvation Army. *See* **J39.**

Sanctuaries were places where offenders against the law were free from arrest, and previous to 1697 when sanctuaries were suppressed, several parts of London were treated as sanctuaries. The chief of these refuge localities was in Whitefriars. There were others in the Minories, Mitre Court, the Savoy, Westminster, and the Mint. Other sanctuaries were at Beverley and at St. Burian's in Cornwall.

Sanderling, small wading bird of sandpiper family; breeds in tundra regions of far north, and is seen on sandy beaches of Britain as a winter visitor. Conspicuous white wing stripe and, like Curlew, Sandpiper, Knot, Dunlin, and other members of sandpiper family, has marked change of plumage between winter and summer.

Sandpiper, small- to medium-sized wading birds of several species whose migratory powers are so great that they are found in most parts of the world. They include the Common Sandpiper, a bird about 7 in. long, greenish-brown head and back, white under-parts; beak long and slender. Other species met with in Britain are the Green, Purple, Wood, and Curlew-Sandpipers.

Sans-culottes (French = without knee breeches), a term applied by the French aristocrats to the revolutionary leaders during the French Revolution who wore long trousers instead of knee breeches.

Sanskrit is the language of ancient India, spoken by the Brahmins, and existing in early Oriental literature. It was the language of literature and government and is now confined to temples and places of learning. Its relationship to the modern Indian languages is rather like that of Latin and Greek to modern European languages. *See also* **M30(1).**

Saponin. The term is a generic one applied to a range of organic compounds which produce frothy, soapy solutions. Saponins are extracted from the soapwort root, horse chestnut seeds, etc. Saponin is the basis of the "foam" used for fire fighting; it can be used like soap to make insecticides and fungicides adhere to the leaves of plants. Also used as detergents.

Sapphic Verse, a form of verse said to have been invented by Sappho, the lyric poetess of Lesbos, who flourished about 600 B.C.

Sapphire, a valuable deep blue variety of Corundum (aluminium oxide) found mostly in India, Ceylon, and Northern Italy. Synthetic sapphire is often used for gramophone styli.

Saprophytes. A term applied to plants which feed on dead organic matter. Many fungi are saprophytes.

Saracen, the name given in classic times to the Arab tribes of Syria and adjacent territories. In the Middle Ages the current designation among the Christians for their Muslim enemies.

Sarcophagus, the name given to a stone coffin, such as was used by the ancient Egyptians, Greeks, and Romans, for receiving the remains of their famous dead These sarcophagi were often decorated with rich carvings and sculptures.

Sardonyx. *See* **Onyx.**

Sarrusophone, bears the same relation to the Oboe as the Saxophone does to the Clarinet (*i.e.*, it has a metal tube and a double-reed mouthpiece). The Contrabass Sarrusophone is sometimes used instead of the Double Bassoon.

Sassanides were a dynasty of Persian rulers descended from Artaxerxes from 226 to 652.

Satellites are small planets revolving round the larger ones. The moon is the earth's only satellite. Jupiter has twelve; Saturn, nine; Uranus, five; Mars, two; and Neptune, two. A number of artificial earth satellites have been launched by America and Russia since Oct. 1957.

Satin-Bird, one of the bower birds of Australia; the male is silky blue-back and the female greyish green. *See* **Bower bird.**

Satinwood, the timber of a tree plentiful in India and Ceylon, and valued for cabinet work. It is of fine grain and very hard. Varieties also exist in the West Indies, Florida, and Tasmania.

Satrap, the name given in ancient times to a Persian Governor of a Province.

Saturday, the seventh day of the week (the Jewish Sabbath), derived its name from Saturn, or, as some hold, is called after the Saxon idol, Saterne, which was worshipped on this day.

Saturn, a planet, the sixth from the sun, from which it is distant about 886 millions of miles, and around which it makes a revolution in about twenty-nine and a half years. It is about 71,500 miles in mean diameter, or nine times as large as the earth, and rotates on its axis in ten and a quarter hours. It is surrounded by a series of rings composed of myriads of tiny satellites. It has nine small satellites. *See* **F7.**

Saturnalia, festivals held in ancient Rome in honour of the god Saturnus. They were made the scene of the most boisterous festivities, and were continued for several days at the end of December.

Sawfish, a large marine ray found in tropical America and Guinea, whose snout often attains the length of several feet, and is provided with saw-like teeth. This "saw" is swung from side to side among a shoal of fish which form the food of this ray.

Sawfly. These insects are considered to be the most primitive members of the order (*Hymenoptera*) to which the bees and wasps belong. In appearance they resemble somewhat the latter, but there is no waist separating thorax and abdomen. The ovipositor is never used as a sting; usually it is saw-like so that the female can use it to make incisions into tissues of plants where the eggs are laid. The larvae look like caterpillars of butterflies and moths. One of the commonest species occurs on gooseberry bushes.

Saxons, a Teutonic race originally inhabiting what is now Holstein. By the 7th cent. they had, with the Angles and Jutes, conquered and colonised most of England.

Scald, the name of the Norse poets, who were

similar to the bards of Wales. They had to celebrate the achievements of their warriors and leaders.

Scallop, marine bivalve molluscs of the genus *Pecten*, which is widely distributed. The scalloped edge to the shell results from a pattern of radiating grooves. Related to the oyster.

Scandium, a metal element, symbol Sc. It was discovered in 1879 by Nilson, and occurs in small quantities in certain rarer minerals such as wolframite.

Scapular, a vestment hanging from the shoulder to the knees, worn by members of certain Roman Catholic orders. The name is also given to two small pieces of cloth worn over the shoulders by lay members of the Church in honour of the Virgin.

Scarabaeidae, a family of beetles (Scarabs) widely distributed through Africa and Asia and the inner parts of Europe. It is to this genus that the "Sacred Beetle" of the Egyptians belongs, and numerous representations of it are found on ancient monuments.

Sceptre, the staff or rod constituting the symbol of supreme authority. Tarquin, the elder, was the first Roman to assume the sceptre in 468 B.C. The French kings of the 5th cent. made a golden rod their sceptre.

Schism, an ecclesiastical term for division in a church. The Great Schism was the separation of the Greek Church from the Latin, finally established in 1054. The Western Schism was the division in the Roman Catholic Church from 1378 to 1417, when there were two lines of popes, one at Rome and one at Avignon, which arose over the election of Urban VI. and Clement VII. to the papacy and was more a matter of persons and politics than a question of faith.

Schist, the geological name of certain metamorphic rocks composed for the most part of minerals with thin plate-like crystals (*e.g.*, mica) so that the layers of a schist are closely parallel. Quartz occurs in schists, and where it preponderates the term "quartz schist" is applied.

Scientific Units. The International Bureau of Weights and Measures at Sèvres near Paris, is the custodian of accurate scientific measurement in terms of internationally agreed units. Methods of measurement are continually being improved and measurements of new kinds coming into use. In defining units certain principles have evolved which can be expressed as a statement of priorities:

(i) units should be so defined that measurements made in one laboratory should be reproducible in another with as much consistency as possible;

(ii) units of all kinds should, so far as practical, form an interrelated system based on as few fundamental units as possible;

(iii) the fundamental units adopted should have a natural basis, independent of particular man-made objects such as metal bars or weights. An invariable universal natural standard was achieved for the metre in 1958 when it was defined in terms of the wavelength of a line in the spectrum of krypton–86. *See* S.I. Units.

Schoolmen, the great scholastic philosophers of the Middle Ages who devoted themselves to the study and exposition of questions of religious inquiry, and attempted to reconcile the teaching of the Church with that of Aristotle. The chief Schoolmen were Archbishop Anselm, Albertus Magnus, Thomas Aquinas, Peter Lombard, Duns Scotus. *See also* J39(2).

Scorpion. The scorpions constitute an order of the arthropods. Distinctive features are the pair of powerful claws at the head and a "sting" at the tail, which curves over the back in attack or defence so that it points forwards. The poison injected by the sting is potent, causing instant death in spiders, centipedes, etc., and acute discomfort to humans. The idea that a cornered scorpion can sting itself to death is a myth; scorpions are immune to their own poison.

Scorpion Fly. The scorpion fly, of which there are less than 500 species, constitute a separate order of insects, the *Mecoptera*. They have 2 pairs of membranous wings, and gain their popular name because in some species the end of the abdomen is turned up, though it does not function as a sting.

Scree *or* **Talus**, the mass of loose, angular rock fragments which accumulate towards the bottom of hill-sides and mountain-sides. These fragments have been detached by weathering processes, in particular frost action.

Scythians, nomadic conquerors and skilled horsemen of ancient times (9th–3rd cent. B.C.) who inhabited much of Southern Europe and Asiatic Russia.

Sea Anemones *or* **Actinaria**, an order of marine animals of the coelenterate class *Anthozia*. They form a large and varied group of about 1,100 species and occur in many beautiful colours, flower-like in form.

Sea Butterfly, marine molluscs which propel themselves by two "wings," or side expansions of the foot. They constitute the order called *Pteropoda*.

Sea Cow. *See* Manatee.

Sea Cucumbers *or* **Holothurians.** These animals constitute the class of echinoderms called *Holothuroidea*. They are elongated and worm-like, with a ring of about twenty tentacles round the mouth. There are about 500 species.

Sea Eagle, a genus of flesh-eating birds related to the true eagles, kites, and other birds of prey. Examples are the Bald Eagle, emblem of the U.S.A., White-tailed Eagle (Grey Sea Eagle), and Steller's Sea Eagle of the Pacific coast of Asia. Last known in Britain in 1911.

Sea Elephant *or* **Elephant Seal**, a curious genus of seal, the males of which possess a proboscis a foot or more in length that suggests an elephant's trunk. They are found on the coast of California and in certain parts of the Southern Ocean; their blubber has a commercial value.

Sea Gravimeter, a new instrument to determine the density of the earth's crust beneath the oceans of the world. Designed by Dr. A. Graf of Munich and Dr. J. Lamar Worzel of Columbia University, it can detect changes of one-millionth of the value of gravity at the earth's surface and is being used in the oceanographical research programme of the I.G.Y.

Sea Hare, a genus of molluscs (*Aplysia*), so-called because of resemblance to a crouching hare. The shell is thin curved plate largely sunk in the animal's body. They have four tentacles, occur in Britain in the laminaria or ribbon-wrack zone, and discharge a purple fluid when molested.

Sea Horse, a sea-fish (*Hippocampus*), very numerous in the tropics and comprising some twenty species. Their bodies are ringed and they have prehensile tails. Their heads are horse-shaped, and they swim in a vertical position.

Sea Lily. A class of echinoderms, the sea lilies may be roughly described as "stalked star-fishes." There are about 400 living species, and several thousand extinct species are known. Otherwise called Crinoids.

Sea Mouse, a genus of marine worms called *Aphrodite*, oval in shape, 8 or 9 in. long, iridescent, covered with fine bristles.

Sea Squirts *or* **Tunicates.** These animals are placed in the sub-phylum called *Urochorda*; found growing in rounded, jelly-like masses on rocks near low-water level. They get their name through the water jets they discharge.

Sea Urchin, species forming the class *Echinoidae*. The body is globular and covered with spines which may be used for both defence and locomotion. The main organs of locomotion are, however, the tube feet, as in starfishes. Much has been learnt of recent years by marine biologists from experiments with the purple sea-urchin *Arbacia*.

Seasons comprise the four natural divisions of the year, and are due to the inclinations of the earth's axis to the plane of the elliptic. *See* Equinox, *also* N25.

Secondary Sexual Characters. Characters of animals which are distinctive of sex, but have no direct connection with the reproductive process. Examples are: the mane of the lion and the antlers of some deer.

Secretary Bird, so called because of the quill-like plumes about its ears, is a bird of prey related to the eagles and vultures; common in Africa, and

of considerable service as an exterminator of snakes. It is a large bird about 4 ft. in height.

Sedimentary Rocks. *See* F8(2).

Seismology, the branch of geophysics devoted to the study of earthquakes and other earth movements. The instruments used for the registration of earth tremors are termed seismographs and consist in principle of a pendulum system, the supporting framework following the ground movement and the bob remaining at rest, thus setting up a relative movement between two parts. In order to record the displacements completely, at one station, three seismographs are necessary to show the two horizontal and the vertical components of the motion. Apart from detection and study of waves from earthquakes, sensitive seismographs are now widely used in geophysical prospecting, particularly in the search for possible oilfields.

Selenium, a non-metallic element, symbol Se, related to sulphur. it is a dark red colour, and solid, found associated with sulphur, iron, pyrites, etc., though only in small quantities. It is a semiconductor (F18) and its special electrical properties have led to its use in photoelectric cells and rectifiers. Selenium is widely used in the chemical industry as a catalyst (*q.v.*) in producing aromatic hydrocarbons from less useful hydrocarbons. Also used in making some types of glass.

Semiconductors, substances with numerous special and useful electrical properties a few of which are:

(i) they conduct electricity much better than do insulators, but much less well than metals (hence their name);

(ii) their power to conduct depends strongly on their temperature—which makes them useful for temperature sensitive devices;

(iii) they are sensitive to light—hence their use in photoelectric cells and solar batteries;

(iv) when in contact with metals, or with other suitable semiconductors, they form a boundary layer which conducts electricity much better one way than the other—this is the basis of many rectifiers some of which, called crystal diodes, are an important component in radios and electronic devices;

(v) their electrical properties can be greatly influenced by putting in minute amounts of impurity, this enables semiconductor devices, especially transistors, to be made with carefully selected properties.

Semiconductors were known to Faraday, but the semiconductor age really arrived with the invention of the transistor (*q.v.*) in 1947. The ubiquitous transistor is only one of very many semiconductor devices which perform a variety of functions in technical apparatus of all kinds. Semiconductors used in technology are usually small crystals, frequently of germanium or silicon, and their robustness and small power consumption often make them superior to other devices, such as thermionic valves, which they often replace. Other semiconducting materials are cadmium sulphide, selenium, lead telluride, indium antimonide.

Senate, the higher governing Assembly of a Legislature. The word, applied primarily to the Roman council, is also used to denote the upper chamber in the legislatures of France, the United States, and other countries. In certain universities the governing body is also called the Senate.

Sensitive Plant. A species of Mimosa (*Mimosa pudica*), whose leaves are extremely sensitive to touch, shaking, and burning.

Sepia, the "ink" of the cuttlefish. *See* Ink Sac.

September, the ninth month of the year, and the seventh of the old Roman calendar; hence the name, from Septimus. The designation was several times changed by the Emperors, but none of the new names survived for long.

Septuagesima Sunday, the third Sunday before Lent.

Septuagint, the Greek translation of the Old Testament made by Alexandrian Jews between 250 B.C. and 100 B.C. from Hebrew texts now lost. There are many differences between the Septuagint and the Massoretic version (A.D. 900), and therefore it is of great value for textual criticism. The symbol for the Septuagint is LXX.

Serfs, the name given to the slaves formerly existing in Russia, who answered to the condition of the feudal "villeins" of England. They were attached to the soil and were transferred with it in all sales or leases. Serfdom existed in Prussia until 1807 and in Russia until 1861.

Serpentine, a mineral: chemically a hydrous silicate of magnesium. Green serpentine is used as an ornament stone. Fibrous serpentine is called asbestos.

Serval, a small carnivorous animal of the lynx order, with black spots on a tawny ground. It is numerous in Africa, preys upon the smaller animals of the deer family, and is sometimes styled the "Tiger Cat."

Set, both in everyday speech (as in tea set, chess set) and in mathematics, a set is a collection of things. The members of the set can be specified by listing them or by describing the properties necessary for membership of the set, *e.g.*, the set of ginger-haired boxers. Set theory is a very important branch of mathematics founded by a great mathematician, Georg Cantor (1845–1918). Its development has influenced many other branches of mathematics. Perhaps one reflection of its fundamental nature is to be found in the fact that many schoolchildren, even of tender age, are now learning set theory and confounding parents who did not hear of it at school twenty years ago.

Settlement, Act of, passed in 1701, assigned the Crown to the House of Hanover in case of Anne's death without children. The decision represented the determination of the squires and the Anglican Church never again to trust themselves to a Roman Catholic king.

Seven Champions of Christendom, as set forth in mediæval literature, were St. George of England, St. Andrew of Scotland, St. Patrick of Ireland, St. David of Wales, St. James of Spain, St. Denis of France, and St. Anthony of Italy.

Seven Churches of Asia, referred to in the Revelation of St. John, were those of Ephesus, founded by St. Paul in 57, Smyrna, Pergamos, Thyatira, Sardis, Philadelphia (Lydia), and Laodicea (Phrygia), all in W. Asia Minor.

Seven Wonders of the World were: 1, the Pyramids of Egypt; 2, the tomb of Mausolus, King of Caria (hence the word mausoleum); 3, the Temple of Diana at Ephesus; 4, the Walls and Hanging Gardens of Babylon; 5, the Colossus at Rhodes; 6, the Ivory and Gold Statue of Jupiter Olympus; and 7, the Pharos, or Watch Tower, built at Alexandria by Ptolemy Philadelphus, King of Egypt.

Seven Years' War was waged by Frederick the Great and England against Austria, France, and Russia, from 1756 to 1763. It resulted in the secession of Silesia to Prussia, of Canada to England, and in the strengthening of our Indian Empire.

Sexagesima Sunday is the 2nd Sunday before Lent.

Sextant, an instrument which has superseded the quadrant as a measurer of angles between distant objects. It is of special importance in navigation and surveying, and contains 60 degrees described on a graduated arc. A small telescope is attached and there are also a couple of mirrors which reflect the distant objects so as to enable them to be accurately observed. The invention is attributed to John Hadley, and to Thomas Godfrey independently, about 1730. Even today it is still the best instrument for telling where you are at sea.

Shad, a marine fish belonging to the same genus as the herring. It is found along the Atlantic Coast of the U.S.A., and ascends rivers to spawn.

Shagreen, shark's skin: also untanned leather of peculiar grain made from skins of wild asses, camels, and horses.

Shalloon, a kind of cloth manufactured from wool and worsted, and used chiefly for women's dresses and coat linings. It gets its name from the fact that it was originally made at Chalons.

Shamrock, the three-leaved clover-like plant native to Ireland and its national emblem.

Shark, a large and powerful ocean fish, comprising many species, very widely distributed, but most numerous in tropical seas. They have formidable teeth and are the most carnivorous of all fishes. They usually attain a large size, the

whale-shark being often of a length of 50 ft. Commercially the shark yields shagreen from its skin, the fins are made into gelatine, and an oil is obtained from the liver.

Sheep, a well-known family of ruminants of great utility as wool-producers, and for food. From the earliest times sheep have been a source of wealth to England. So much were they valued in the 15th and 16th cent., that their exportation was frequently prohibited. Sheep are classified under (1) longwools; (2) shortwools; and (3) mountain breeds. Most of the longwools carry Leicester blood in their ancestry and the shortwooled Down breeds carry the blood of the Southdown. The Southdown produced the present Suffolk, one of the most popular breeds. Cheviot is an important mountain breed. Of the foreign breeds the most valued are the Merino sheep of Spain, which yield a fine long wool. Australia, U.S.S.R., Argentina, India, U.S.A., New Zealand, and S. Africa are the chief wool-producing countries in the world.

Shelduck, a handsome genus of surface-feeding ducks, one of which, the common shelduck, is an inhabitant of this country. It is a beautiful white-and-chestnut plumaged bird with dark-green head and neck and red bill. Another species, the ruddy sheldrake, appears in Britain only occasionally.

Shellac. This resin is the secretion of the lac insect (*Coccus lacca*), which occurs in forests of Assam and Siam. It is used for making varnish and in the manufacture of gramophone records. *See also* Lac.

Sherardizing. Process for coating steel or iron parts with zinc to prevent corrosion; this is done by heating the parts in a closed rotating drum containing zinc dust.

Shilling has been an English coin from Saxon times, but it was not of the value of 12 pence until after the Conquest. It is interchangeable with the 5 new pence decimal piece which came into circulation in 1968.

Ships have existed from prehistoric times. There is mention of one that sailed from Egypt to Greece in 1485 B.C., and in 786 B.C. the Tyrians built a double-decked vessel. No double-decked ship was known in England, however, before the *Royal Harry* was built by Henry VII., and it was not until the 17th cent. that ship-building was carried on in this country as a prominent industry.

Ship-worm. *See* Teredo.

Shoddy, the name given to a kind of cloth mainly composed of woollen or worsted rags, torn up and re-fabricated by powerful machinery. It was first made at Batley in Yorkshire about 1813, and became a very important industry employing many thousands of people at Batley and the neighbouring town of Dewsbury.

Shot, the name given to solid projectiles fired from guns. In the time of Henry V. stone shot was used, later leaden shot, then iron shot, and finally steel shot, introduced by Sir Joseph Whitworth.

Shrike, a large and varied family of birds of hawk-like behaviour found in all continents except S. America. The Red-backed Shrike, which winters in Africa, is a breeding visitor to England and Wales. It is commonly called the "Butcher Bird" from the way it impales its prey (small birds and insects) on thorn-twigs. The other species on the British list are the Great Grey Shrike, the Lesser Grey Shrike, the Woodchat Shrike, and the Masked Shrike.

Shrove Tuesday, the day before the first day of Lent, receiving its name from the old custom of shriving, or making confession, on that day. In England the day has always been associated with the making of pancakes.

Sicilian Vespers, the term applied to the terrible massacre of French people in Sicily in 1282. The French under Charles of Anjou were then in occupation of the island, and had been guilty of many cruelties. It began at Palermo on Easter Monday at the hour of vespers and resulted in the expulsion of the French king and the introduction of Spanish rule.

Silence, Tower of, or *dakhma*, a tower about 25 ft. high, built by the Parsees for their dead. The corpse is taken inside by professional corpse-bearers and left to be consumed by vultures. Parsees do not burn or bury their dead, and the *dakhma* is to protect the living and the elements from defilement.

Silhouette, a form of black profile portrait, invented by Etienne de Silhouette in 1759, and formed by an outline cutting made with scissors or other sharp instrument from cloth, paper, or other flat substance.

Silicon, an important non-metallic element, symbol Si, it is related to carbon. Next to oxygen, it is the most abundant constituent of the earth's crust (27% by weight). It occurs in many rocks, and its oxide occurs in many forms (*e.g.*, quartz, sand, flint, agate, chalcedony, opal, etc.). Coming into use as a semi-conducting material for making transistors and similar devices.

Silicones are synthetic organic derivatives of silicon which because of their high resistance to heat and moisture have special uses, *e.g.*, lubricants, heat-resistant resins and lacquers, and water-repellent finishes. Silicones are compounds in which the molecules consist of chains of atoms of silicon and oxygen alternately. Silicones were developed in the United States from discoveries first made by Prof. F. S. Kipping at Nottingham University. Manufacture began in Britain in 1950, and in the form of fluids, resins, rubbers, and greases they find wide use in industry. The largest plant in Europe is in Glamorgan.

Silk, the name given to a soft glossy fabric manufactured from the fine thread produced by the silkworm. It was known to, and highly prized by, the ancients, being at one time paid for, weight for weight, with gold. The manufacture of silk was carried on in Sicily in the 12th cent., later spreading to Italy, Spain, and the south of France. It was not manufactured in England before 1604; but when certain French refugees established themselves at Spitalfields in 1688, the industry was developed and became of importance. In the 18th cent. the Lombes of Derby achieved great success in this industry. Japan, China, Italy, Korea, and the Soviet Union are the chief silk-producing countries.

Silkworm, the larva of a species of moth, *Bombyx mori*. It is native to China, and has been cultivated with success in India, Persia, Turkey, and Italy. The silkworm of commerce feeds on mulberry leaves and produces a cocoon of silk varying in colour from white to orange. The cocoon is the silken habitation constructed by the worm for its entrance upon the pupal condition, and to obtain the silk the pupa is killed by immersion in hot-water.

Sill, a sheet-like mass of igneous rock which has been intruded parallel with the stratification of the country rock, cf. a dyke.

Silurian. This geological period is one of the major subdivisions of the Palaeozoic era. Its beginning is estimated at 440 million years ago, and the period lasted about 40 million years. Maximum thickness of the Silurian strata in Britain measures 15,000 ft. *See* F34.

Silver, a white precious metal, symbol Ag (Latin *argentum*), found in a free state, also in certain combinations, and in a variety of ores. The chief silver-producing regions are the Andes and Cordilleras. Peru, Bolivia, and Mexico have yielded vast supplies of the metal since the 16th century, and Colorado and Nevada in the United States have also been very prolific in silver yield. In England standard silver (that used for coinage) formerly contained 92½ per cent. fine silver and 7½ per cent. alloy, but when the price rose to 89½*d*. per oz. and the coins became worth more than face value, the Coinage Act of 1920 was passed, reducing the fineness to half. To provide silver bullion for industry and for a fund towards the redemption of our silver debt to America, it was decided in 1946 to replace the United Kingdom silver coinage by one made of cupro-nickel (75 per cent. copper, 25 per cent. nickel). Maundy money, however, is of the original silver standard. Silver chloride and bromide are light-sensitive compounds and are used in photography.

Simony, the offence of trading in church offices, has been contrary to English law since the time of Edward VI. Elizabeth also promulgated laws against simony. In 1879 a Royal Commission reported on the law and existing

practice as to the sale, exchange, and resignation of benefices. The position is now controlled by the Benefices Act 1898, the Amendment Measure 1923, and the Benefices Rules 1926.

Sinn Fein (*Irish* = ourselves alone), an Irish nationalistic movement founded in 1905 which developed into a mass republican party and triumphed in the establishment of the Irish Free State. A small extremist group has survived which represents politically the outlawed I.R.A.

Sins, The Seven Deadly or **Capital Sins** are pride, avarice, lust, anger, gluttony, envy, sloth.

Sirius, the dog-star, so called because of its situation in the mouth of the Dog (Canis Major): it is the brightest of all the fixed stars, and is also one of the nearest to us.

Sirocco, a warm, southerly, often dust-laden, wind blowing across Mediterranean lands from the Sahara, in advance of an eastward-moving depression over the Mediterranean.

Siskin, a small bird of the finch family, common in Northern regions, nesting in Britain. The common Siskin has a yellow-green colour and is a lively, swift-flying bird with a stout bill.

Sistine Chapel, the chapel of the Pope in the Vatican, renowned for its frecos by Michelangelo.

S.I. Units (Système International d'Unités) form an internationally recognised system of metric units for scientific and technical quantities. The basic units of length, time, mass, electric current, temperature, and luminous intensity are, respectively, the metre, second, kilogram, ampere, degree Kelvin (*see* **Absolute Temperature**), and candela. The S.I. was recommended for general adoption by a number of international organisations such as the General Conference on Weights and Measures (1960). Many countries have made or are making the S.I. the only legally recognised set of units. Gt. Britain's intention to "go metric" will bring widespread use of S.I. units in its train. These units command the widespread though not absolutely unanimous support of industrialists, technologists, and scientists. Many have urged that their adoption will be a triumph of common-sense and end the confusing multiplicity of units on the world scene. *See* **N13**.

Six Articles, The Statute of the, was passed in 1539 for compelling adhesion to the chief doctrines of Roman Catholic faith; transubstantiation, communion in one kind only for the laity, vows of chastity, celibacy of the clergy, private masses, and auricular confession: those who refused to subscribe to the Articles were treated as heretics. The Act was repealed in 1547.

Skate, a genus of sea-fishes related to the Rays.

Skink. The skinks constitute a large family of lizards with large smooth scales, under each of which is a bony plate. The largest species, found in Australia, is about 2 ft. long. Some skinks have adopted a burrowing habit and degeneration of the limbs is associated with this. The Common Skink is a small species about 5 in. long, living in the deserts of N. Africa.

Skua, falcon-like marine birds related to the gulls, found throughout the world. Known as "Robber Birds" because they steal not only the young and eggs of other birds (including penguins) but also their food, which they force them to disgorge in mid-air. The Arctic Skua breeds as far south as Scotland. The Great Skua breeds in both Antarctica and Arctica. Other species are the Pomarine, the Long-tailed, and McCormick's Skua.

Skunk, a North American mammal of the weasel family, with short legs and long bushy tail. All fifteen species are black and white, some being striped and the rest spotted. It secretes and ejects at will a foul-smelling fluid. Anything tainted with this retains the odour for days.

Sky. The blue colour of the sky on a summer's day is the result of the scattering of light waves by particles of dust and vapour in the earth's atmosphere. Blue light having almost the smallest wavelength in the visible spectrum (0·00004 cm.) is scattered laterally about 10 times as much as the red (0·00007 cm.).

Skyscraper. Owing to lack of ground space, increasing cost of land, and growth of modern cities, buildings are being made higher than broader; hence the name. The structures are constructed of a steel framework usually clothed in concrete or reinforced concrete. Among the highest New York skyscrapers are the Empire State Building (102 stories, 1,250 ft.), Chrysler (77 stories, 1,046 ft.), and the Rockefeller Center (70 stories, 850 ft.). The tallest building in Britain is the 580 ft. Post Office radio tower (basic diameter 52 ft.) near Tottenham Court Road, London. Japan's first skyscraper, the Kasumigaseki building (36 stories), in Tokyo, was due for completion in 1968.

Slate, fine-grained clayey rocks which have undergone metamorphism. They cleave easily, and it is this property of cleavage which makes them a valuable source of roofing material. Welsh slates are among the best, there being important quarries at Penrhyn, Llanberis, and Ffestiniog.

Slavery. In its earlier forms, as in the times of ancient Greece and Rome, in the feudal ages, when vassalage and villeinage existed, and in the serfdom of Russia and other northern nations, slavery was attended by many inhumanities and evils; but perhaps in the negro slavery system which prevailed in the British colonies for upwards of 200 years and in certain parts of the United States up to 1865, it attained its highest point of cruelty. In 1833 the Act of Emancipation was passed, emancipating all slaves in British territories, though slavery continued to be tolerated in northern Nigeria, Sierre Leone and in the Anglo-Egyptian Sudan long after that date. Even today slavery and forced labour are still prevalent in some parts of the world. *See* **C45(2)**.

Slide Rule, an instrument which consists of two logarithmic scales sliding alongside each other. By its use multiplication, division, extraction of roots, etc., are speedily carried out.

Sloth, a curious family of mammals, only found in Central and South America. They dwell almost entirely in the trees, proceeding from branch to branch with their bodies hanging downwards, their weight being supported by their large hook-like claws. They eat foliage.

Slow-Worm, a species of lizard found in Britain which lacks legs. Silver with longitudinal brown stripes, it lives almost entirely on slugs.

Smelting. The process of heating an ore with a reducing agent to convert ore into metal, and with a flux to convert rocky impurities into a slag that will float on top of the molten metal. Slag and metal can then be tapped separately. An example is iron smelting; the reducing agent is coke, and limestone is added as the flux; the smelting is carried out in a blast furnace.

Snake. The snakes constitute the important reptilian order *Ophidia*. Snakes have a scaly, cylindrical, limbless body, lidless eyes, forked tongue, and the upper and lower jaws joined by an elastic ligament. Their locomotion is accomplished by means of the excessive mobility of their numerous ribs. All snakes have teeth used for seizing prey, and the poisonous varieties are furnished with poison fangs in the upper jaw. These fangs are hollow modified teeth and the venom passes into them from a special gland situated behind the angle of the mouth. Some 2,500 species of snakes are known, divided into 13 families. There are 3 British species—the grass-snake, smooth-snake and adder.

Snipe, a wading bird, long-legged, with long, slender, straight bill, brown plumage, and zig-zag flight. The Common Snipe breeds locally throughout Britain; the Great Snipe and small Jack Snipe are occasional visitors. The close season is Feb. 1 to Aug. 11.

Snort (*Ger.* Schnorchel), a tubular device of modern invention used in submarines. It contains two pipes for the intake of air and outlet of gases, and can be maintained above the level of the surface of the water. When a submarine is submerging with snort at the surface it is said to be *snorting*.

Snow. When water vapour condenses at high levels at a temperature below freezing, a cloud of ice particles is formed. If these frozen droplets are small, they fall slowly and gradually assume a feathery crystalline structure, reaching the earth as snowflakes if the temperature remains below freezing.

Socialism. *See* **J40**.

Soda, carbonate of sodium, is now mainly obtained by certain processes of manufacture from

common salt. It was formerly obtained from the ashes of plants. Bicarbonate of sodium is the primary product in the Solvay or Ammonia-soda method for commercial manufacture of soda; it is also formed when carbon dioxide is passed into strong soda solution. The bicarbonate is used in medicine and in the preparation of baking powder.

Sodium, a metallic element, symbol Na (Latin *Natrium*), first obtained by Sir Humphry Davy in 1807 from caustic soda by means of the electric battery. Its chloride is *common salt*; the deposits of salt (*e.g.*, in Cheshire and at Stassfurt) have come into existence through the drying up of inland seas. Salt occurs in sea-water to the extent of about 3 per cent.; the Dead Sea contains about 22 per cent. The blood of animals is maintained at a level of about 0·6% sodium chloride. That there is sodium in the sun's atmosphere was confirmed in 1859 by Kirchhoff from his spectroscopic observations. Liquid sodium metal has properties which make it suitable as a coolant in some nuclear reactors. A technique of handling this very reactive liquid has had to be developed.

Soil, the superficial covering of land areas composed mainly of disintegrated rock material and the remains of dead plants and animals (humus) and containing in varying amounts trace elements and other nutriments essential for plant growth.

Solar Battery, one of the innumerable devices made possible by the development of semiconducting materials, notably germanium and silicon. This device creates an electric current from light falling on it. The current can be put to use or stored in storage batteries. The energy of the current is derived from the sunlight, and the solar battery is thus an *energy converting* apparatus. Solar batteries have provided power for the instruments in satellites. In London in 1960 a car (developed in the U.S.A.) was demonstrated running on the power from sunlight and solar batteries.

Solar Wind, a continuous stream of electrically charged particles blowing outwards from the sun, supplemented from time to time by intense outbursts from particular regions of the sun's surface. These streams of protons and electrons on encountering the earth's magnetic field cause magnetic storms and aurorae.

Soldering is a means of joining together two pieces of material, usually metals, by melting a third metal (the solder) into the joint. The solder solidifies in the pores of the other metals and holds them together. The materials to be joined are not themselves melted so the technique requires less heat than welding. Solders are alloys; there are many kinds depending on the materials to be joined and the strength of joint desired. *See* **Welding**.

Solstice, an astronomical term indicating the point at which the sun is most distant from the equator. *See* **N25**.

Soundings at sea, to determine depth at any point, have been taken in all seas, and with considerable accuracy. A deep reading was that of the *Challenger* expedition in 1873, near St. Thomas's in the North Atlantic, when 3,875 fathoms were sounded. In 1851 H.M.S. *Challenger* recorded the then maximum ocean depth in the Marianas Trench (W. Pacific) by echo-sounding as between 5,882 and 5,940 fathoms. Another deep was located in the S. Pacific in 1952–53 of 5,814 fathoms in the Tonga Trench, 180 miles S. of Tonga Tabu. Since then even greater depths have been recorded, in the Marianas Trench and the Mindanao Deep. *See* **Pacific Ocean**.

Southern Cross, popular name of *Crux*, a constellation of the Southern hemisphere, consisting of four bright stars in the form of a Latin cross. It has been called the pole-star of the south and is indispensable to seafarers.

South Sea Bubble, the name given to a series of financial projects which began with the formation of the South Sea Company in 1711 and ended nine years later in disaster after a mania of speculation. The idea behind the parent scheme was that the state should sell certain trading monopolies in the South seas in return for a sum of money to pay off the National Debt (which stood at £51,300,000 in 1719 when the scheme started). The idea fascinated the public, fabulous profits being dreamt of, and the price of the stock rose out of all proportion to the earnings of the Company. Many dishonest speculative ventures sprang up in imitation with the inevitable result that thousands were ruined. All classes had joined in the gamble and a Committee of Secrecy set up by the House of Commons in Dec. 1720 to investigate the affairs of the Company proved that there had been fraud and corruption on a large scale in the affairs of the Company. Sir Robert Walpole who had been an opponent of the scheme from the outset dealt with the crisis.

Soya Bean. This is the bean of a leguminous plant (*Glycine soja*) found in Asia. The bean meal, which is rich in protein and oil, is familiar in Britain as "soya flour."

Space Flight. The Soviet Union was the first country to launch a man into space and bring him safely back to earth. This epoch-making event took place on April 12, 1961, when Yuri Gagarin, tragically killed in an air crash in 1968, circled the earth in a spaceship weighing about 4½ tons. It was launched by rocket in an elliptical orbit with greatest height 187 miles and least 109 miles. The inclination of the orbit to the equator was 65 deg. 4 min. and the period of revolution was 89 min. 6 sec. Since then, the Russian *Vostok* cosmonauts Titov (17 orbits), Nikolayev (64 orbits), Popovich (48 orbits), Bykovsky (81 orbits), Tereshkova, the first woman space traveller (48 orbits), the *Voskhod* cosmonauts Komarov, Feoktistov and Yegorov (16 orbits), Belyaev and Leonov (17 orbits), the American *Mercury* astronauts Glenn (3 orbits), Carpenter (3 orbits), Schirra (6 orbits), Cooper (22 orbits), the *Gemini* astronauts Grissom and Young (3 orbits), McDivitt and White (62 orbits), Cooper and Conrad (120 orbits), Borman and Lovell (206 orbits), Schirra and Stafford (15 orbits), Armstrong and Scott (6·6 orbits), Stafford and Cernan (44 orbits), Young and Collins (43 orbits), Conrad and Gordon (44 orbits), Lovell and Aldrin (60 orbits) have completed successful missions in space. Leonov was the first to perform the extra-vehicular (EVA) experiment (1965), *i.e.*, to leave an orbiting spaceship and float freely in space. He was tethered to his ship by a 15 ft. lifeline and travelling at a speed of 5 miles a second. Russia again took the lead (Oct. 1967) by achieving an automatic docking between two unmanned orbiting satellites, regarded as the most important step forward since the first manned space flight in 1961. Having been controlled from the ground into similar orbits, the Russian *Cosmos* satellites took over the control of themselves once in sight of each other, requiring great refinement both of onboard computing ability and of guidance. After the docking the two spacecraft continued to fly together and after 3½ hours automatically disengaged and spun away into different orbits. The linking indicated the intention of the Russians to build large space platforms—for astronomical and other scientific observations and eventually as part of the manned lunar enterprise. And to do this by computer systems instead of by astronauts.

Space Research. By space research we mean scientific research work which can only be carried to otherwise inaccessible observing locations by rocket propulsion. Such propulsion does not rely on the presence of an atmosphere to provide oxygen so that it is capable in principle of conveying objects to unlimited distances. The subject of space research is, therefore, one which is concerned with scientific applications in various fields of a single highly specialised and powerful technique. It is not a single discipline, but can provide data of great importance for many, such as the physics of the earth, the sun, moon, and other bodies of the solar system, astronomy, geodesy, and the study of gravitation. The prospect of investigating the biological conditions on different planets such as Mars and Venus is also opened, as well as that of experimental biological studies under conditions of zero gravity. Although the results of many aspects of space research are vital for those concerned with the practical realisation of manned travel in space, space research is largely a

branch of pure science, independent of any applications which may stem from it. The major technical problems involved in space research are:

(*a*) Launching of the instrument-containing vehicle with the necessary velocity.

(*b*) Guidance and control of the vehicle so it pursues the desired path.

(*c*) Tracking the vehicle to determine its actual path and the position on the path at any time.

(*d*) Transmission of the data, recorded by the instruments, back to the earth.

(*e*) Satisfactory operation of scientific instruments in the environment within the vehicle.

(*f*) Provision of adequate power supplies to operate the equipment within the vehicle for sufficiently long periods.

Spanish Civil War, 1936 to 1939. The war commenced by a revolt by the Fascist General Franco against the Republic which had succeeded the Monarchy in 1931. Germany and Italy aided the rebels who besieged Madrid for over 2 years. An International Brigade was formed to help the Republic, but the Spanish Government was faced by the greater part of the Army, and very effective assistance from Italy and Germany. Those powers seized the opportunity to have a curtain-raiser to the world conflict which they intended to precipitate. After a total loss of a million men the Fascists overpowered the Republic.

Sparrow, name given to finch-like birds found in most parts of the world, of which the House Sparrow *Passer domesticus*, is the most familiar of British birds. Also native to Britain is the rural Tree Sparrow, distinguished from the male House Sparrow by its chestnut crown. Other European species are the Italian, Spanish and Rock Sparrows.

Specific Gravity, defined as the ratio of the mass of a particular volume of a substance to the mass of an equal volume of water at 4° C. *See* Hydrometer.

Spectroscopy. Newton's arrangement with the prism was the first spectroscope; its function was to separate out the colour components of a source of light. Two hundred years elapsed before this apparatus was developed into a precise scientific instrument, capable of measuring both the wavelength and intensity of each colour component. In this form it is called a spectrometer. All atoms and molecules have well defined characteristic spectra which can be used to recognise them. In order to produce emission spectra it is necessary to energise the material under investigation by some means, such as by heating in a flame. The resulting radiation then consists largely of sharp bright lines, characteristic of the material. Absorption spectra are produced by interposing the experimental material between a white light source and the spectrometer. Then dark lines are seen, corresponding to absorptions of energy, in exactly the same places as the bright lines are observed in the emission spectra. Spectroscopic techniques have now been developed to such an extent that accurate measurements of wavelength and intensity are possible not only in the visible region, but over almost the whole of the electromagnetic spectrum. Not only does spectroscopy play an important rôle in probing the structure of matter, but it can be applied in the field of astronomy. The use of radio wave spectroscopy has led to the discovery of several new types of stellar object, and this data is now producing a complete reappraisal of our understanding of the universe.

Sphinx, in Greek mythology, a winged creature with a woman's head and a lion's body. The sphinx of ancient Egypt represented the pharaoh in a divine form. The most famous is the Great Sphinx at Giza, sculptured out of natural rock.

Spiritualism. *See* J41.

Spirituals, negro melodies with religious inspiration and which are still spontaneously created, but have also passed into art-music.

Sponge, a marine organism consisting of a colony of cells organised in a more primitive way than most multi-cellular organisms without a nervous system. While the sponge lives a current of water circulates through the main apertures. It is the dead skeleton of this mass that forms the sponge of commerce. *See* F26(1).

Spoonbill, a long-legged, marsh bird, closely related to the ibis and stork, remarkable for its snow-white plumage and broad, flat, spoon-shaped bill. The European species has not bred in England since the beginning of the 17th cent., but is still a regular summer visitor from Holland, where it nests in colonies in reed-beds and islets.

Sputniks, the name of the Russian earth satellites first launched during the period of the International Geophysical Year. *Sputnik I*, launched 4 Oct. 1957, became the first man-made earth satellite. *Sputnik II*, launched a month later, carried a dog as passenger. *Sputnik III*, launched in May 1958, and weighing well over 2 tons, became the first fully-equipped laboratory to operate in space. The father of space travel with rockets was a Russian—Konstantin Eduardovich Tsiolkovsky—the centenary of whose birth practically coincided with the launching of the first earth satellite.

Squirting Cucumber, *Ecballium elaterium*, so named from the fact that when ripe it breaks from the stalk and ejects its seeds and juice from the hole made by the breakage.

Stainless Steel. The development of stainless steel for cutlery manufacture, etc., began with the discovery of Harry Brearsley in 1912 that steel containing 12 per cent. of chromium is rust-proof.

Stalactites are deposits of calcium carbonate formed on the roofs and sides of limestone caves, and in tunnels, under bridges, and other places where the carbonic acid of rain-water percolates through and partly dissolves the limestone, resulting in the growth of icicle-like forms that often assume groupings. The water that drops from these may deposit further calcium carbonate, which accumulates and hardens into a series of sharp mounds or hillocks called stalagmites.

Starch is an organic compound occurring in granules in nearly all green plants, and especially in the seeds of dicotyledonous and cereal plants, potatoes, etc. In its pure form starch is a tasteless, odourless white powder, and is a carbohydrate consisting of carbon, hydrogen, and oxygen.

Star Chamber, an ancient tribunal of State in existence in 1487 and possibly earlier, charged with the duty of trying offences against the Government, unfettered by the ordinary rules of law. It was in effect a Privy Council entrusted with judicial functions. Under Charles I. the Star Chamber was used by the King and his party to persecute opponents; and in 1641 a Bill carried in both Houses abolished it.

Starling (*Sturnus vulgaris*), a well-known European bird now common in many parts of the world. It has handsome iridescent blackish plumage and nests in holes and crevices. Flocks of starlings are often seen wheeling in the air; thousands roost on buildings in the heart of London. Other European species are the Spotless and Rose-coloured starlings. The latter sometimes wanders to the British Isles.

States-General, national assembly in which the chief estates of the realm were represented as separate bodies. The name, though not the institution, has survived in the Netherlands, where the two houses of parliament are known as states-general. In France the states-general consisted of three orders, clergy, nobility, and commons. Philip IV. first summoned it in 1302 to support him in his quarrel with Pope Boniface VIII. While absolute monarchy was establishing itself it met rarely, and not at all from 1614 until 1789, when it was convoked as a last resort by Louis XVI. But when it met it declared itself the National Assembly which marked the beginning of the revolution.

Statistics is a science that deals with the collection of numerical facts and the evaluation of their significance. The word is also used to refer to the facts themselves as in "trade statistics." This important science gives precise meanings to words like "average" and to statements like "this set of data is significantly different from that." In a world in which more and more information is becoming available in numerical form (I.Q.s, examination results, tax

yields, health records, road accidents, etc.) the proper—as opposed to the misleading—use of statistics cannot be over-emphasised. Many young people can now study statistics at school and college, and governments and industries employ many statisticians. *See* Average.

Statute of Westminster, 1931. An Act of parliament which gave a basis of equality to the British Dominions. The Dominions as well as the United Kingdom were defined by the Balfour Memorandum of 1926 as " autonomous communities within the British Empire, equal in status, in no way subordinate one to another in any aspect of their domestic or external affairs, though united by a common allegiance to the Crown, and freely associated as members of the British Commonwealth of Nations." The Statute was the sequel. The Dominions are sovereign States governed solely by their own Parliaments and Governments.

Steam Engine, a machine whereby steam becomes the active agent of the working of machinery, and of very wide application. The leading types of steam engine are: (*a*) condensing, or low-pressure engines, where the steam is generated by a boiler; (*b*) non-condensing, in which the cylinder exhausts its steam into the open air. Engines of the latter type are used where portable engines are required

Steam Hammer, invented by the Scottish engineer James Nasmyth (1808–90) in 1839, which proved of great utility in the development of the iron trade. The hammer itself, which is fixed to the end of a piston-rod passing through the bottom of an inverted cylinder, often weighs as much as 80 or 100 tons, and is so perfectly controlled by the steam power that its action can be so accurately gauged that it could be made to crack the glass of a watch without actually breaking it, or brought down upon a mass of molten iron with a force representing many hundreds of tons.

Stearin is the portion of fatty matters and oils which remains solid at an ordinary temperature, and is a compound of stearic acid with glycerine. It is largely used in the manufacture of candles and for other commercial purposes. With caustic soda stearin forms a soap (sodium stearate), which is present in most commercial soaps which contain sodium palmitate and oleate in addition.

Steel, an alloy of iron and carbon, with varying proportions of other minerals. The famous blades of Damascus and steels of Toledo were made by the cementation and crucible method. The metal produced by the " Bessemer process " (*q.v.*) is of the highest value for structural purposes, rails, etc. In recent years the technique known as continuous casting has been developed which bypasses some major steps in the conventional process of steel-making. *See also* Stainless Steel.

Stereophonic Broadcasting. A person having normal hearing is able to determine the direction from which a sound reaches him by virtue of the fact that he has two ears, and, therefore, the sound will reach one of them a fraction of a second before it reaches the other. This difference in arrival time allows the brain to calculate direction. It will, therefore, be apparent that if the same person listens to, say, an orchestral concert in a large hall he will be able to determine—even with his eyes shut—the approximate position of a particular instrument with respect to the rest of the orchestra. If, however, he listens at home to a broadcast of the same concert, then, due to the fact that he hears the music after it has been picked up by a single microphone located at one point and radiated over a single-channel transmission system, he will be unable to allocate a definite position to any instrument. The aim of stereophonic broadcasting or sound reproduction, therefore, is to restore the listener's ability to locate the position in space of the various sources of sound and to follow movement. To do this it is necessary to use two microphones in the studio—to simulate the two human ears—and to transmit their outputs, through two similar, but separate, chains of equipment, to two radio receivers and their two loudspeakers, which must be placed some distance apart, in the listener's home.

Stereotype, a metal cast taken from movable type which has been set up in the ordinary way. The first to introduce the process in practical form in this country was William Ged, of Edinburgh, who made stereotype plates in 1730. An impression of the type matter is first taken by means of a mould of prepared plaster of Paris or moistened sheets of specially prepared paper, and when molten stereo metal is poured upon the mould and allowed to cool and harden, the stereo plate is formed, and can be printed from as a solid block for some time.

Steroids. A class of structurally related compounds, based on a system of condensed rings of carbon and hydrogen, which are widely distributed in animals and plants. Included in the steroid family are sterols, found in all animal cells, vitamin D, sex hormones, bile acids, and cortisone, a drug used in the treatment of rheumatic fever.

Stibnite, the chief ore of antimony; chemically it is antimony sulphide. Steely-grey in colour.

Stickleback, a family of small spiny-finned fish widely distributed in both fresh and salt water. Male constructs roofed nest held together by sticky secretion from glands near kidneys. Several females deposit eggs therein which he jealously guards until after young are hatched.

Stirrup, a loop of metal U-shaped strap suspended from the sides of the saddle, used for mounting and to support the horseman's foot. Some authorities allege their use as far back as the early Iron Age, and it is generally believed that they were used in battle in A.D. 378, when the Gothic cavalry defeated the legionaries of the Emperor Valens at Adrianople. Stirrups relieved the tension on the rider's knees and so enabled him to be armed from top to toe.

Stoat, a slender, carnivorous mammal with short legs, related to the weasels. The stoat is distinguished from the latter by its longer tail, which has a black tip. The black tip is retained even in the winter when the animal turns white, the fur then being known as " ermine." It is found in northern latitudes, and is abundant in Arctic America.

Stoma (pl. **stomata**), microscopic pores on the surfaces of leaves through which gaseous exchanges take place and water is lost. It has been estimated that a single maize plant bears 200 million stomata, usually closed at night.

Stone-Flies, comprise the order of insects called *Plecoptera*, which includes some 700 species, of which about thirty occur in Britain. The wings are membranous, and two long, thread-like feelers protrude at the tail end. The larvae are aquatic.

Stonehenge, a remarkable collection of Bronze Age monuments arranged in two circles, 340 ft. in diameter, standing on Salisbury Plain, Wiltshire. Modern archaeological research dates origin back to between 1860 and 1500 B.C. There is some evidence to suggest that the monument may have been built for astronomical purposes, providing a method of keeping a calendar for predicting the seasons and foretelling eclipses of sun and moon. *See also* J13(1).

Stork, a family of heron-like birds with long bills, freely distributed over Europe, Asia, Africa, and S. America. The White Stork is an occasional visitor to England, and, more rarely, the Black Stork; these are the only two European storks.

Stratosphere, a layer of the earth's atmosphere, which begins 6–7 miles above the earth. The attraction of the stratosphere as a medium for air travel rests upon the absence of storms; indeed weather phenomena as commonly understood do not occur, there being no vertical temperature gradient in the stratosphere and no convection currents.

Stratum (pl. **strata**), a bed or layer of rock.

Strontium. This silver-white metallic element was discovered by Hope and Klaproth in 1793, and isolated by Sir Humphry Davy in 1808. The chief strontium minerals are celestite (sulphate) and strontianite (carbonate). Compounds of strontium give a brilliant colour to fireworks and signal flares. Radioactive isotopes of strontium (strontium-90) are formed as fission products in nuclear explosions and tend to collect in bone on account of the chemical similarity of strontium and calcium (*q.v.*). This genetic hazard is a cause of great alarm. *See* Fall-out.

Sturgeon, a large fish found in northern seas and

rivers with five rows of bony plates along the back and sides and pointed mouth with four barbels. Caviare is prepared from sturgeon ova. Since the reign of Edward II. all sturgeon caught off the coasts of Britain, except in certain privileged places, have belonged to the Sovereign.

Sublimation, when a solid substance is heated and turns into vapour without passing through the liquid stage and then condenses as a solid on a cold surface, it is said to "sublime" and the process is called "sublimation". Iodine behaves in this way, and sublimation is used as a method of purifying it. For the psychological meaning, *see* **Freudian Theory, Section F, Part III.**

Submarine, the first submarine, the *Nautilus*, was designed by Robert Fulton and tried out in the river Seine and in the sea off Brest in 1801. The idea was too revolutionary to find acceptance and it was not until electricity for under-water propulsion became available that the submarine underwent extensive development. Britain became interested about 1900 and the Germans developed it and made it into an instrument of warfare. The first voyage under the North Pole was made in 1958 by the American nuclear-powered submarine *Nautilus* (*q.v.*). The Royal Navy's nuclear submarine fleet is being expanded to include 10 vessels: 4 Polaris (*Resolution* launched 1966, *Renown* launched 1967), and 6 hunter-killer attack submarines (*Dreadnought* and *Valiant* in commission; *Warspite* and *Churchill* under construction; two ordered, as yet unnamed). *Resolution* successfully test-fired Britain's first Polaris missile in Feb. 1968.

Suez Canal, connecting the Mediterranean and the Red Sea, was built by the French engineer Ferdinand de Lesseps and opened in 1869. An Egyptian company, *Canal Maritime de Suez*, was formed in 1866 with a capital of 200 million francs. The British Government acquired 176,602 shares out of a total of 400,000 for £4 million (value Mar. 31, 1956, £28,982,544). Its length is 101 statute miles, minimum width 196 ft. 10 in. (navigation channel). Under the Convention of 1888 all nations were granted freedom of navigation without discrimination in peace or war. The right was recognised by Egypt in the Anglo-Egyptian Agreement of 1954, under which Britain agreed to give up the Suez base. The Suez Canal Company was nationalised by the Egyptian Government without warning on July 28, 1956, since when it has been widened and deepened and the average time of transit reduced. The Canal has been barred to Israeli ships since the creation of the state of Israel in 1948, and to all shipping since the Middle East war of 1967. *See* **C14(2)**.

Suffragette, member of the Women's Suffrage Movement who in the early part of this century agitated to obtain the parliamentary vote. The movement ended in 1918, when women of 30 were given the vote. In 1928 a Bill was passed which granted equal suffrage to men and women. The leaders of the Women's Suffrage Movement were Mrs. Pankhurst and her two daughters, Sylvia and Dame Christabel, Mrs. Fawcett, Nellie Kenny, and others.

Sugar, to the chemist the term is a generic one covering a group of carbohydrates, including cane sugar (sucrose), glucose, fructose, and maltose. In ordinary parlance sugar means sucrose, which is obtained from the sugar cane, sugar beet, or sugar maple.

Sulphur, an elementary, brittle, crystalline solid, symbol S, abounding in the vicinity of volcanoes. It is yellow in colour. It occurs in combination with other elements, as sulphates and sulphides, and allied with oxygen, hydrogen, chlorine, etc., is of great commercial utility. Used in its pure state it constitutes the inflammable element in gunpowder; it is also used for matches and for making sulphuric acid.

Sulphuric Acid, a compound of great commercial importance, used in a variety of manufactures, and composed of sulphur, oxygen, and hydrogen. Extremely corrosive.

Sun, one of the millions of stars in the universe, the centre of the solar system, estimated to be distant from the earth 93,004,000 miles, to have a diameter of 865,000 miles, and a volume a million times that of the earth. It rotates on its axis from east to west, though not as a solid, the solar equator turning once in about 25¼ days and the poles in about 34 days. Large spots are observed on the sun—varying in size from 30,000 miles in diameter—which form and disappear at irregular intervals. The area of the disc covered by the spots, however, reaches a maximum roughly every 11 years, when the sun's heat seems rather greater than usual and magnetic storms more frequent (sunspot cycle). Spectrum analysis show that the sun is composed of many elements found in the earth. Its surface temperature is about 6,000° C. Observations made in 1964–65 (Year of the Quiet Sun) complemented those obtained during the International Geophysical Year 1957–58, when the sun was remarkably active. The earth is in the outer atmosphere of the sun and subject to its winds and storms. The apparently inexhaustible heat of the sun, which has maintained life on the earth for millions of years, is derived from the destruction of matter, involved in the transmutation of hydrogen nuclei into helium nuclei, in which process about four million tons of matter is destroyed every second. At this rate of conversion the sun will go on radiating for 30,000 million years. The Soviet space rocket *Lunik I*, fired on 2 Jan. 1959, became the first artificial planet of the sun. *See also* **F7.**

Superconductor, a metal in a state in which its electrical resistance has entirely vanished so that electric currents can flow indefinitely without generating heat or decreasing in strength. The superconducting state of metals was first discovered in mercury by Onnes in Leiden in 1911. There are many magnetic and thermal properties associated with superconductivity and the phenomenon as a whole has proved to be of great scientific interest; it resisted explanation till about 1957. In the meantime many metals and alloys were found to show the property but only at very low temperatures—below *c.* −260°C. There is a growing number of practical applications, *e.g.*, coils of superconducting wire (kept very cold by liquid helium) can be made to carry enough electric current to produce strong magnetic fields. Such fields are very constant and do not require the large supply of electrical power that ordinary electromagnets need.

Supersonic, pertaining to speeds greater than the speed of sound waves. In air at sea-level sound waves travel at about 760 m.p.h., and a plane or projectile moving faster than this (at sea-level) would be *supersonic*. Not to be confused with **ultrasonic** (*q.v.*). Aircraft travelling at supersonic speeds produce shock waves in the air somewhat analogous to the bow waves of fast-moving ships. These shock waves are regions of intensely disturbed air which produce the sonic boom effect so distressing to people living near supersonic routes. *See* **Sonic Bangs, Section F, Part IV.**

Surface Tension. The surfaces of fluids behave in some respects as though they were covered by a stretched elastic membrane. This property is called "surface tension." The action of detergents may be attributed in part to a reduction in the surface tension of water, allowing it to wet the surface of dirty articles. *See* **Detergency, Section F. Part IV.**

Surrealism. The aim of the Surrealist school of painting and sculpture is to overcome the barriers between conscious and unconscious mind, the real and unreal worlds of waking and dreaming. As such it has a long and respectable ancestry, although the term was not in use until 1922 when it was picked by André Breton from Guillaume Apollinaire who had used it in connection with certain works by Chagall. However, Bosch in the 15th cent., Fuseli and Goya in the 18th, and many other purveyors of the weird and fantastic were the forerunners of modern Surrealism. The modern movement has broadly speaking taken two different directions: the first was towards complete fantasy and absurdity which took the form of "found objects" —*e.g.*, a bird-cage filled with sugar-cubes and a thermometer, a bottle-dryer, a bicycle wheel, or abstract works with strange and apparently irrelevant titles such as Paul Klee's *Twittering*

Machine; the second towards highly detailed and realistic paintings of objects placed in strange juxtapositions—*e.g.*, Salvator Dali's trees with limp watches drooping over their branches or Georgio de Chirico's deserted and classical-looking streets with long arcaded perspectives and a lone statue or a bunch of bananas in the foreground. On the whole Surrealism has spent its initial force and become almost respectable; its idea of strange juxtapositions, now widely commercialised, finds a place in advertisement illustrations and in the more sophisticated forms of window-dressing.

Surtax an additional duty of income tax, chargeable on total income in excess of £2,000. The starting level on *earned* income is £5,000 or more depending on personal allowances. Payable on Jan. 1 following year of assessment, so that surtax for 1966–67 is payable on Jan. 1, 1968. Charged on a sliding scale. The first £3,000 of *investment* income, after deduction of personal allowances as allowed for surtax, is exempt from the special charge for 1967–68. The remainder is charged at the following rates: £3,000–4,000, 2*s*. per £; £4,000–5,000, 3*s*. per £; £5,000–8,000, 6*s*. per £; over £8,000, 9*s*. per £. *See* Income Tax.

Swans, large, graceful birds which together with the ducks and geese form the family Anatidae. There are three European species with white plumage; the Mute Swan, distinguished by its orange bill with black knob, being the best known and a familiar sight on the rivers and ornamental lakes of this country. Two wild swans are winter visitors here, the Whooper and Bewick's Swan. The "pen" (female) and "cob" (male) mate for life and the young swans are called "cygnets."

Swan-upping. The annual marking of the Thames swans which takes place during the third week of July. This ancient ceremony dates back to the 15th cent. when all the Thames swans were declared to be Royal birds owned by the Crown. Two city guilds—the Vintners' and Dyers' Companies—own one third of the 600 swans now on the Thames. This privilege was granted to them by King Edward IV. in return for money grants. Vintners' birds are marked with a nick on each side of the bill, the Dyers' with a nick on the right side only. The Queen's birds are unmarked.

Sweet Potato. This plant (*Ipomoea batatas*), which is a climbing perennial belonging to the convolvulus family, has thick roots that are rich in starch, and are eaten like potatoes. A native of the W. Indies and Central America, new varieties of sweet potato have been bred which stand cooler climates and can be grown as far north as Cape Cod. The sweet potato of New Zealand is called the Kumara.

Swift, a bird so-called from the extreme speed of its flight, resembling a swallow but related to the humming-bird. It has long, scythe-like wings, sooty-black plumage and greyish-white chin. There are several species inhabiting most parts of the world, particularly the tropics. The British breeding bird is among the latest to return from Africa and the earliest to go. Swifts are the only birds to use saliva for their nests. One oriental species builds its nest entirely from saliva.

Sword, weapon used in personal combat, originally made of bronze. The Romans introduced the iron sword, 20 in. long. During the Middle Ages the most famous blades were those made by the Arabs at Damascus and those made at Toledo.

Symbiosis. When two organisms live together and both derive mutual benefit from the association, the partnership is known as symbiosis. An example is the symbiosis of an alga and a fungus in lichens; another is the ordinary pea plant and the bacteria which live in the nodules on the pea's roots.

Synapse is the point of association between one nerve cell and another. The nervous impulse travelling along one nerve has to be transmitted to the next across a minute gap. This is the synaptic gap. The mode of transmission is chemical though it was at first thought to be electrical. The impulse arriving at the synapse releases a chemical transmitter which diffuses across the gap and stimulates an impulse in the adjacent nerve cell.

Synod, an assembly of the clergy of a particular church, state, province, or diocese. The Synod of Whitby (663) settled the dispute between the Celtic and the Roman churches in the matter of Easter in favour of the Roman system of reckoning.

Synoptic Charts. These are meteorological charts used in forecasting on which weather conditions at a network of stations, at a standard hour of observation, are recorded, using symbols of the international weather code.

T

Tabard, a cloak or outer garment worn in mediæval days by the peasantry. The name was also applied to a garment worn by knights over their armour.

Tailor-Bird, name of a small group of warblers, familiar in India and China, and remarkable for their habit of sewing leaves together to enclose their nests. The bill is used as needle, vegetable fibre as thread, and a knot is tied to prevent it slipping.

Taj Mahal, the white marble mausoleum built at Agra by Shah Jehan in memory of his favourite wife who died in 1629. Over 20,000 men were occupied for over twenty years in its erection.

Takahe or Notornis, large New Zealand bird of the rail family which for many years was believed to be extinct. Small colony found in 1948 in remote valley of mountainous part of the S. Island. The bird is strictly protected.

Take-over Bid describes an offer made to all the shareholders of a company to purchase their shares at a named price and conditional upon acceptance by the holders of a named proportion of the total share issue. If accepted the purchaser thus gains control of the company.

Tallage, in Norman times, were taxes levied by the Crown upon lands of the royal demesnes. The levying of tallage was taken away by a statute of 1340 which required the consent of Parliament for all direct taxes.

Tallow, the more solid portions of animal fat, and prepared from beef, mutton, etc., by melting at a low temperature. Stearin is its chief constituent. Used for making candles, soap, etc.

Tally Office, in the Exchequer, was the department of the Government in which tallies were kept, representing the acknowledgment of moneys paid or lent; in 1834 the Houses of Parliament were burnt down through the overheating of a stove with discarded Exchequer tallies.

Tambourine, a light, small, single-headed drum with loose metal discs let into the side of the hoop so that they jingle when the tambourine is shaken. An older name for it is the timbrel.

Tammany, a New York democratic organisation, sprang out of an old benevolent society named after an Indian chief, and has exerted a powerful influence over political movements in New York. The leaders of the organisation have used their power when their party has been successful at the polls to appoint their nominees to every prominent office, and have exacted bribes for concessions and privileges, and generally Tammany rule has meant wholesale corruption. Of this there is ample evidence in the disclosures of the Tweed and other Tammany frauds, and in the fact that the "Boss" usually contrived to make himself wealthy.

Tannins are chemical substances obtained from a variety of plants and trees, from oak-bark, and from galls. They are used in the leather trade, the tanning process making the skins resistant to decay.

Tantalum, a scarce bluish metallic element, symbol Ta, discovered by Ekeberg in 1802. Chemically related to vanadium and niobium, it is usually associated with the latter in nature. For several purposes it can be used in place of platinum, and it finds application in the making of surgical instruments. Tantalum is very hard, and resistant to acids (other than hydrofluoric acid); it is used in alloys.

Taoism. *See* J42.

Tapestry, a fabric largely used in former times for wall decoration and hangings. It was known to the ancient Greeks, but in its modern form came into prominence in the 15th and 16th cent., when it was manufactured in a marked degree of excellence by the weavers of Flanders, especi-

ally those of Arras. The manufacture was introduced into England early in the 17th cent., and was attended by considerable success. At the present day the term is applied to worsted cloths for furniture coverings, and there are also various kinds of tapestry carpets now made. The most famous tapestries of olden times were the Aubusson Tapestry and the Savonnerie. The Gobelin Tapestry factory, originated in Paris in the reign of Francis I., is still a national establishment. *See also* **Bayeux Tapestry.**

Tapirs. The tapirs constitute a family close to the horse family and the rhinoceros in the Ungulate order. They have four toes on the front feet and three on the hind. The snout is drawn out into a short trunk. The largest tapir is the Malayan tapir, which stands 3½ ft. at the shoulder. Four species occur in Central and S. America.

Tar is a dark viscid product obtained from the destructive distillation of wood, coal, peat, etc. Wood tar is acid owing to the presence of acetic acid ("pyroligneous acid"). The highest proportion of coal tar goes into road making. Distillation of coal tar yields many valuable compounds, including benzene, phenol (carbolic acid), naphthalene, and creosote; the final residue after distillation is pitch. Based on the chemical manipulation of compounds from coal tar is the preparation of many perfumes, food essences, drugs, antiseptics, and plastics.

Tarantula, the name given to a large range of big hairy spiders. Music was supposed to cure their sting, hence the Tarantella dance.

Tarpeian Rock at Rome received its named from the tradition that Tarpeia, the daughter of the Governor of the Citadel who betrayed the fortress to the Sabines, was crushed to death by their shields and buried beneath the rock. From this height persons guilty of treason were hurled to death.

Tartaric Acid is prepared from tartar (potassium hydrogen tartrate) deposited in wine vats during fermentation. "Cream of tartar" is purified potassium hydrogen tartrate, which is incorporated in baking powder. Tartaric acid is also used in the manufacture of effervescent salts, and in medicine (*e.g.*, "tartar emetic").

Tate Gallery, named after its founder, Sir Henry Tate, at Millbank, S.W., was opened in 1897; Sir Henry Tate bore the cost of the building (£80,000) and also contributed the nucleus of the present collection. "The Turner Wing," the gift of Sir Joseph Duveen, was added in 1910. The collection is thoroughly representative of British art and has been extended several times to include modern foreign art.

Tay Bridge spans the Tay at Dundee, opened for rail traffic on 20 June 1887. A previous bridge, completed in 1877, was blown down on 28 Dec. 1879, as a train was passing over it. A new bridge was opened on 18 August 1966 for road traffic, 7,356 ft. in length, the longest road bridge in Britain.

Tea was introduced into England about the middle of the 17th cent., when it was a great luxury, and fetched from £6 to £10 a pound. It is an Asiatic plant, native properly to China, Japan, and India. Up to about 1885 most of the tea imported into this country came from China; the bulk now comes from India and Ceylon.

Teal, the smallest of the European ducks and next to the Mallard the commonest British species. It is a handsome bird and a very swift flier, but not as swift as the Garganey or Summer Teal.

Te Deum, the song of praise ("Te Deum laudamus"—"We praise Thee, O God"), is supposed to have been the composition of St. Ambrose in the 4th cent. and is used in Roman Catholic and English Church services.

Telecommunications. The sending of messages over a distance. The term is generally applied to the sending of messages by telegraph, telephone, radio, television or radar. The first submarine telegraph cable between England and France was laid in 1850 and, following Hertz's investigations into electric waves, Marconi's invention led to Britain being linked with Europe by wireless telegraphy in 1899. The first permanently successful telegraph cable across the Atlantic was laid in 1866. The first telephone service between London and Paris was opened in 1891. The electro-magnetic telephone was invented by Alexander Graham Bell, a Scottish-born American, in 1876. The first submarine telephone cable to span the Atlantic was laid in 1955, which enables speech to be transmitted over a distance of 2,000 miles. Before that, transatlantic communication was by radio-telephone. The rapid advance of scientific discoveries and technical capacity makes it certain that new telecommunication facilities will be available in the near future for data transmission, *e.g.*, traffic control systems, automatic processes, reading of supply meters. The performance of *Telstar* in July 1962 and of *Early Bird* in April 1965 showed that intercontinental communication by satellites in space is practical. *See also* **Radar, Radio, Television.**

Telemetry, measurement at remote distances by means of a radio-link from the object (missile or satellite) to the ground. The third Russian sputnik, for instance, carried apparatus for measuring, among other things, the pressure and composition of the atmosphere, and the intensity of different kinds of radiation from the sun. Its radio transmitter, powered by solar-energy batteries, sent out the information in coded form by means of uninterrupted signals at 20·005 megacycles with a duration of 150–300 milli-seconds. Radio telemetry from inside the body is being increasingly used in medical and biological research; miniature radio transmitters can be swallowed or implanted in man or animal to detect various physiological conditions.

Telepathy and Clairvoyance. *See* J43.

Teleprinter, a telegraph transmitter with a typewriter keyboard, by which characters of a message are transmitted electrically in combinations of 5 units, being recorded similarly by the receiving instrument, which then translates the matter mechanically into printed characters. The telex or public teleprinter service provides direct person-to-person transmission of written messages.

Telescope, an optical instrument for viewing objects at a distance, "the astronomer's intelligencer." Lippershey is credited with construction of the first in 1608; Galileo constructed several from 1609 and Newton was the first to construct a reflecting telescope. The ordinary telescope consists of an object-glass and an eye-lens, with two intermediates to bring the object into an erect position. A lens brings it near to us, and the magnifier enlarges it for inspection. A refracting telescope gathers the rays together near the eye-piece and is necessarily limited as to size, but the reflecting telescope collects the rays on a larger mirror, and these are thrown back to the eye-piece. The world's largest reflectors are at Mount Palomar Observatory, California (200 in.), Mount Wilson Observatory, California (100 in.), the McDonald Observatory at Mount Locke, Texas (82 in.), and the Victoria B.C. Observatory (72 in.). At the Royal Observatory, formerly at Greenwich, now at Herstmonceux, Sussex, a 98 in. *Isaac Newton* telescope has been installed. The *Hale* 200 in. telescope at Mount Palomar is the largest ever made and has revealed objects never before photographed; it is able to probe space and photograph remote galaxies out to a limiting distance of 2,000 million light years. The *Schmidt* telescope at Mount Palomar has been used to make a huge photographic map of the universe. The giant steerable radio telescope built by Manchester University at Jodrell Park, Cheshire, has a 250 ft. reflector with a beam width of 12 minutes of arc. Early in its career it tracked the Russian earth satellites and the American lunar probes. Another instrument of radio astronomy is the interferometer which consists of two spaced aerials. *See also* **Observatories.**

Television, or the transmission of images of moving objects by radio. To understand the problems of television it is necessary to consider the action of the human eye. Basically the eye consists of a lens which projects an image of the scene before it upon the retina, a light-sensitive screen at the back of the eye. The retina is made up of several millions of tiny light-sensitive elements, each quite separate and distinct from its neighbours, and each separately connected to the brain by an individual fibre in

the optic nerve. Thus the eye is a very complex organ, and it is able to pick out numbers of tiny details from a scene and convey each detail separately and simultaneously to the brain. It does not send a blend of different points of light and shade in the same way that the ear sends a blend of different sounds: if it did the brain would receive a completely unintelligible blur. From this it is clear that a television system which transmitted a mixture of detail would be useless; it must transmit all the details in a scene separately, yet almost simultaneously, and re-assemble them at such a speed that the eye cannot observe the building-up process. A means of doing this was provided by Nipkow in 1884, when he invented his famous scanning disc, and later Weiller invented the mirror drum for the same purpose. Such mechanical devices as these held the field for many years and in 1923 Baird in this country and Jenkins in America were both using them for the experiments which, in 1925, led to the successful transmission of shadows and simple outlines. It was not until 1926, however, that the first practical demonstration of television, as we understand it, took place when Baird transmitted by radio moving pictures of living human faces over a short distance. The B.B.C. began television broadcasts in 1930; the I.T.A. in 1955. The first television exchange across the Atlantic was made in July 1962 by way of the *Telstar* satellite.

Tellurium, a relatively scarce element, symbol Te, discovered in 1782 by Reichenstein. Chemically it behaves rather like sulphur; its salts are known as tellurides. It occurs chiefly combined with metals in ores of gold, silver, copper, and lead. It is a semiconductor, and some of its compounds (also semiconductors) are coming into use in technical devices.

Templars were soldier knights organised in the 12th cent. for the purpose of protecting pilgrims in their journeyings to and from Jerusalem, and obtained their name from having had granted to them by Baldwin II. a temple for their accommodation. At first they were non-military, and wore neither crests nor helmets, but a long wide mantle and a red cross on the left shoulder. They were established in England about 1180. During the crusades they rendered valuable service, showing great bravery and devotion. In the 12th cent. they founded numerous religious houses in various parts of Europe and became possessed of considerable wealth. It was this that caused their downfall. Kings and Popes alike grew jealous of their influence, and they were subjected to much persecution, and Pope Clement V. abolished the Order in 1312. Edward II. in 1308 seized all the property of the English Templars. The English possessions of the Order were transferred to the Hospitallers of St. John, afterwards called the Knights of Malta. *See also* **Hospitallers, Knights, Teutonic Order.**

Temple, a building dedicated to the worship of a deity or deities. Those built by the ancient Greeks at Olympia, Athens, and Delphi were the most famous. The Temple of Diana at Ephesus was another. The Temple of Solomon at Jerusalem was destroyed and rebuilt several times; Herod's Temple was destroyed by the Romans in A.D. 70.

Temple Bar, an historic gateway that until 1879 stood at the western entrance to Fleet Street near the bottom of Chancery Lane. In olden times it was the custom to impale the heads of traitors over this gateway. It has been at Theobald's Park, Cheshunt, since 1888.

Tenor, the third voice in a male voice choir, *i.e.*, between alto and bass. The name is also applied to instruments of equivalent pitch, *e.g.*, tenor saxophone.

Terbium, an element, symbol Tb, discovered in 1842 by Mosander, belonging to the group of rare-earth metals.

Teredo, the scientific name of the ship-worm, a peculiar bivalve mollusc, which lodges itself when young on the bottoms of wooden ships and bores its way inwards, causing much injury.

Termites, also known as *White Ants*, though they are not related to the true ants and are placed in an entirely different insect order (*Isoptera*). They abound in the tropics and also occur in temperate countries, though only two species are common in Europe. There is no British species. They live in colonies and their nests take the form of mounds of earth and wood, cemented together with saliva, and up to 20 ft. in height. Five separate castes are recognised, three of them being capable of reproduction, and the other two are sterile.

Tern. This slender, gull-like bird has long pointed wings, a deeply-forked tail, pale grey and white plumage, black cap, and is a very graceful flier. There are several species, some of which are summer migrants to Britain. The Arctic tern winters in the Antarctic, returning to find a nesting place in the spring.

Terrapin, a kind of fresh-water tortoise. There are several species widely distributed in the Northern Hemisphere.

Tertiary Rocks, in geology the rocks formed during the Caenozoic era comprising the Eocene, Oligocene, Miocene, Pliocene and Pleistocene periods. *See* **F34.**

Teutonic Order, of German military knights, was founded in the Holy Land at the end of the 12th cent. for succouring the wounded of the Christian army before Acre. They were dispersed in the 15th cent. but the Order continued to exist until 1809, when Napoleon I. confiscated its properties. In 1840 the order was resuscitated in Austria as a semi-religious knighthood. *See also* **Hospitallers, Knights, Templars.**

Thallium, a blue-grey metallic element, symbol Tl, discovered by Crookes in 1861. It is obtained from the flue dust resulting from the burning of pyrites for sulphuric acid manufacture.

Theodolite. The instrument used by surveyors for measuring angles in the horizontal and vertical planes; also used in meteorology for following balloons to measure the speed and direction of wind.

Therm. The charges for gas for lighting and heating (formerly reckoned at per cubic foot) are now based on the calorific, or heat, value of the gas, and the unit used is termed a therm. The therm is 100,000 British thermal units.

Thermionic Emission is the departure of charged particles from matter under the influence of heat. The higher the temperature the greater the flow of escaping particles. The most common example is the emission of electrons from red-hot electrodes—this is the basic phenomenon made use of in thermionic valves (*see* **Valve**). If the hot electrode (the cathode) is enclosed in an evacuated or gas-filled bulb, the emitted electrons can be collected at another electrode (the anode) and will flow through an external circuit back to the emitter. Thus an electric current has been generated by heat.

Thermodynamics, a term first applied by Joule to designate that branch of physical science which treats of the relations of heat to work. What is called the first law of thermodynamics is thus stated by Clerk Maxwell: "When work is transformed into heat, or heat into work, the quantity of work is mechanically equivalent to the quantity of heat." In one of its many formulations, the second law asserts that "the heat tends to flow from a body of hotter temperature to one that is colder, and will not naturally flow in any other way." *See* **F16(2).**

Thermo-electric Devices. If two wires of different materials are formed into a loop and if the two joins are kept at different temperatures a current flows in the loop. This was discovered by Seebeck in 1822, and the device is called a thermocouple. The electric current could in principle be made to drive some useful machine, and the energy comes from the heat that is absorbed by the thermocouple—if one part of the thermocouple is not hotter than the others it will not work. It has long been realised that this is a device that converts heat directly into electricity without raising steam and driving dynamos as in a power-station. However, until recently nobody has used thermocouples for much besides temperature measurement, for which they are exceedingly useful. The new development is the manufacture of semiconductors (*q.v.*); for the thermoelectric effects of these new materials are much greater than those of metals. A material much studied in this connection is a compound of bismuth and tellurium, bismuth telluride. It now seems

practicable to generate useful electricity from suitably designed thermocouples. For example, the U.S.S.R. produces a thermoelectric device which uses the heat from the chimney of a domestic oil-lamp to produce enough electricity to work a radio. Presumably this is very useful in remote parts with no electricity supply. But the possibilities do not stop there. Indeed, an eminent Russian authority has stated that thermocouples could produce electricity direct from the warmth of sunlight on a scale and at a cost comparable with conventional fuel-burning power-stations. Even if solar energy cannot be so used, it might be possible to use the heat of nuclear reactors, but this means that the thermoelectric devices would have to stand up to very heavy radioactivity and still work. It is not surprising, however, that many firms are showing great interest in thermoelectricity these days.

Thermometer, an instrument by which the temperature of bodies is ascertained. The most familiar kind of thermometer consists of a glass tube with a very small bore, containing, in general, mercury or alcohol. This expands or contracts with variation in the temperature, and the length of the thread of mercury or alcohol gives the temperature reading on a scale graduated in degrees. Various forms of thermometer are used for particular purposes.

Thermonuclear Reactions. *See* **Nuclear Fusion.**

Thirty-nine Articles. *See* **Articles.**

Thistle, Order of. *See* **Knighthood.**

Thorium, a scarce, dark grey, metal element, symbol Th, discovered by Berzelius in 1828. All substances containing thorium are radioactive. Chief source of thorium is monazite sand, big deposits of which occur in Travancore (India), Brazil, and the U.S.A. Considered important as a potential source of atomic energy since the discovery that it can be transmuted into U233, which is capable of fission like U235.

Thrush, a large family of song-birds of the *Passeriform* order, distributed all over the world. The British species include the robin, redstart, nightingale, song-thrush (or mavis), blackbird, mistle-thrush, ring-ouzel of the mountains, and large numbers of migrant fieldfares and redwings from northern Europe are winter visitors.

Thunder, the sound heard after the occurrence of a lightning flash. It is due to vibrations of the air along the path of the flash, which are set up by the sudden heating (and expansion) followed by the rapid cooling (and contraction) to which the air is subjected. It is unusual for thunder to be heard more than 10 miles away, the distance being estimated roughly by allowing 1 mile for every 5 seconds which elapse between seeing the flash and hearing the thunder. Continued rolling of thunder results from the zig-zag nature of the flash and the multiple strokes of which it is composed, variations in the energy developed along the path, and echo effects. Thunderstorms are caused by powerful rising currents of air within towering cumulonimbus clouds and are most frequent during the afternoons and evenings of sunny summer days.

Thursday, the 5th day of the week, named after Thor, the Scandinavian deity. To the ancient Romans Thursday was *dies Jovis*, or Jupiter's day.

Tidal Power. The principle of exploiting the energy of the tides is similar to hydro-power since it involves the harnessing of falling water. A barrage across a bay or estuary is filled during flow tide and closed during ebb tide creating a difference in level. When the water is allowed to fall towards the lower side of the barrage it operates a turbine which drives a generator. More sophisticated schemes would incorporate pumped storage facilities. An essential requirement is a large tidal range in order to get a sufficient head of water. Although a 240MW scheme has recently been completed on the River Rance in France, it is believed that the economics of tidal power are generally insufficiently favourable for the method to be widely used. *See also* **Hydroelectric Schemes.**

Tides, the periodical rise and fall of the waters of the ocean and its arms, are due to the gravitational effect of the moon and sun. Newton was the first to give a general explanation of the phenomenon of the tides. He supposed the ocean to cover the whole earth, and to assume at each instant a figure of equilibrium, under the combined gravitational influence of earth, sun, and moon, thus making and controlling the tides. At most places there are two tides a day, and the times of high- and low-water vary according to the positions of the sun and moon relative to the earth. When earth, moon and sun are in line (at full moon and new moon) the gravitational pull is greatest and we get "spring" tides. When sun and moon are at right angles (first and third quarters of the moon's phases) we get the smaller "neap" tides.

Tiers Etat, the lowest of the three estates of the realm as reckoned in France—nobility, clergy, and commons (*tiers état*)—prior to the Revolution.

Tiger, a powerful carnivorous animal of the cat family, which occurs in India and certain other parts of Asia. Its skin is of a tawny yellow, relieved by black stripings of great beauty of formation. Some tigers attain a length of from 9 to 12 ft.

Time. The measurement of time has become of increasing importance to man with the advance of civilisation. It was at first almost inevitably based on the succession of night and day, the waxing and the waning of the moon, and on the changing seasons of the year, and the astronomical observation of these three periodic effects has served as the basis of time measurement until recent years. The precision of the observations has continually increased, and clocks have been developed for dividing the day into smaller units. The clocks were adjusted so as to keep in step with the rotation of the earth on its axis, but during recent years an atomic standard of time has been developed, and clocks are now adjusted so as to keep in step with the natural period of an atomic vibration. *See* **Clocks, Greenwich Mean Time, British Standard Time.**

Tin is a white, metal element, symbol Sn (Latin *Stannum*), whose commonest ore is cassiterite (tin oxide), which occurs in Malaya, Indonesia, Bolivia, Congo, Nigeria, and Cornwall. It protects iron from rusting, and the tin coating on tinplate is applied by dipping the thin steel sheet in molten tin or by electrolysis. Tin alloys of importance include solder, bronze, pewter, and Britannia metal.

Tit *or* **Titmouse**, a small insectivorous bird of the woodlands and forests, bright of plumage and very active and agile, often seen hanging upside down searching for food. There are over fifty species, eight of which occur in Britain: the Great and Blue Tits, familiar in gardens and countryside, the Cole Tit, Marsh Tit, Willow Tit, Bearded Tit, Long-tailed or "Bottle" Tit, and the Scottish Crested Tit.

Titanium, a scarce metal, symbol Ti, difficult to extract from ores, found in association with oxygen in rutile, anatase, and brookite, as well as with certain magnetic iron ores. It combines with nitrogen at a high temperature. Discovered by the Rev. William Gregor in 1791. Titanium alloys, being very resistant to stress and corrosion, and combining strength with lightness, are finding wide application not only in marine and chemical engineering but in the building of aircraft, rockets, and the nuclear-energy field. Titanium dioxide is now widely used in making paints.

Tithes, an ecclesiastical tax consisting of a tenth part of the annual produce known to the ancient Jews, and first imposed by Christian authorities in the 4th cent., although not made compulsory in England before the 9th cent. Tithes derived from land are termed "praedial," those derived from cattle being styled "mixed," while others are personal. After the passing of the Tithes' Commutation Act of 1836, tithes were gradually converted into rent charges, and today the old form of tithes exists only to a small degree. Consult Tithe Act of 1936.

T.N.T. (Trinitrotoluene). A high explosive formed by the action of a mixture of nitric and sulphuric acids on toluene. Not highly sensitive to shock, it can be used in shells without danger, and is exploded by a time, or detonator, fuse. Apart

from wartime applications, it is used in blasting in quarries and mines.

Toad, an amphibian, differing from the frog in having a dry, warty skin, a heavier, squat build and shorter limbs. It has a similar metamorphosis, is largely nocturnal, and will wander far from water after the breeding season. Two toads occur in Britain, the Common Toad and the Natterjack. The latter can be identified by the narrow light stripe running down the middle of the back.

Tobacco is made from the leaves of various narcotic plants of the *Nicotiana* family, which contain a volatile oil and an alkaloid called nicotine. Tobacco is largely grown in America, India, Japan, Turkey, Greece, Canada, Italy, Indonesia, Bulgaria, Philippines, France, Congo, China, Rhodesia, Zambia, S. Africa, S. America, and other countries of a warm climate. It undergoes various processes of preparation. The leaves are first dried, then cut into small pieces, moistened and compressed, and in this form it is known as cut or "shag" tobacco; when moistened with syrup or treacle and pressed into cakes, it is Cavendish; when twisted into string form, it is "twist" or "pig-tail." For cigars the midribs of the dry leaves are removed, and what is left is moistened and rolled into cylindrical shape. For snuff, the tobacco leaves are moistened and allowed to ferment, then dried, powdered and scented. *See* Section P (Respiratory System) for the connection between tobacco-smoking and lung cancer.

Tolls. Payments for privileges of passage were first exacted in respect of ships passing up rivers, tolls being demanded on the Elbe in 1109. Tolls for land passage are said to have originated in England in 1269, toll-bars being erected at certain distances on the high-roads in the 17th cent., where toll had to be paid for all vehicles passing to and fro. After about 1825 they began to disappear, but still linger on some country roads and bridges. Tolls on London river bridges ceased in 1878–79.

Tonic Sol-Fa, a system of musical notation in which monosyllables are substituted for notes. Thus the major diatonic scale is represented by Doh, Ray, Me, Fah, Soh, La, Te, Doh. The system was invented by a Miss Glover of Norwich in about 1840 and has proved of great assistance in the teaching of music in schools.

Tonsure, the shaven part of the head of a Roman Catholic ecclesiastic, dates from the 5th or 6th cent. In the Roman Catholic Churches only a circle, or a crown, is shaved, while in the Greek Church shaving is forbidden.

Topaz, a transparent mineral gem, being a silicate and fluoride of aluminium and generally found in granitic rocks. Its colour is yellow, but it also occurs in pink and blue shades. The best kinds come from Brazil.

Topiary, the art of clipping and trimming trees, shrubs, etc., into ornamental shapes. In Britain this art goes back before Elizabethan times when gardens were formal and the shapes simple and symmetrical. By the end of Queen Anne's reign topiary had become much more elaborate, and all kinds of fanciful shapes were produced. Pliny in his *Letters* tells how box hedges were clipped into different shapes in Roman times.

Tornado, a violent whirlwind, characterised by a black, funnel-shaped cloud hanging from heavy cumulonimbus. Usually tornadoes are only a few hundred feet in diameter and occur frequently in the Mississippi region of the U.S.A., where it has been estimated that the wind speeds within them may exceed 200 m.p.h. In West Africa the term is applied to thundery squalls.

Tortoises and Turtles, are cold-blooded reptiles, four-footed, and encased in a strong shell protection, the shells of some species being of beautifully horny substance and design, in much demand for combs, spectacle frames, and ornamental work. It is the custom to designate the land species as tortoises and the aquatic kinds as turtles. The green turtle, so called because its fat has a green tinge, is in great demand for soup. Together the tortoises and turtles make up the reptilian order called *Chelonia*, the biggest representatives of which are the giant land tortoises of the Galapagos Islands, reaching a weight of 500 lb. and living a century. Some of these giant tortoises are even said to have reached 200 or 300 years of age.

Toucan, a South and Central American family of brilliantly coloured birds, remarkable for their huge bills. Toucans live on fruit, are of arboreal habits, and nest in holes. There are about 37 species.

Touchstone, a kind of jasper called by the ancients "Lydian stone," of economic value in testing the quality of metal alloys, especially gold alloys. The testing process is very simple. The alloy is drawn across the broken surface of the Touchstone, and from the nature of the mark or streak it makes the quality of the alloy can be ascertained.

Tourmaline, a mineral occurring in different colours in prismatic crystals. It is a well-known example of a pyro-electric crystal, *i.e.*, one that has a permanent electric polarisation. It is a double silicate of aluminium and boron, and occurs in Cornwall, Devon, South America, and Asia.

Tournaments were equestrian contests between military knights and others armed with lances, and frequent in the Middle Ages. The Normans introduced them to England.

Tower of London was built as a fortress by William the Conqueror. It was a royal palace in the Middle Ages and later used as a garrison and prison. Many distinguished prisoners were executed there, including Anne Boleyn, Catherine Howard, Lady Jane Grey, the 2nd Earl of Essex, and Sir Walter Raleigh. The Chapel Royal of St. Peter and Vincula in the Tower was built in 1105 and took its present shape in the reign of Henry VIII. The Crown Jewels are kept at the Tower, and in the Armoury a fine collection of armour is preserved. The attendant staff are called Yeomen Warders of the Tower. Their style of dress is of the Tudor period.

Trade-Mark, a mark used in relation to goods for the purpose of indicating a connection in the course of trade between the goods and some person having the right, either as a proprietor or registered user, to use the mark. Trade-marks can be registered, the registration holding good for 7 years and being renewable thereafter indefinitely for periods of 14 years. Infringement of a registered trade-mark renders the infringer liable to damages.

Trade Winds form part of the circulation of air round the great permanent anticyclones of the tropics and blow inwards from north-east and south-east towards the equatorial region of low pressure. Atlantic trades are more regular than those of the Pacific. The belts may extend over 1,500 miles of latitude and, together with the Doldrums, move north and south in sympathy with the seasonal changes in the sun's declination, the average annual range being about 5 degrees of latitude.

Trafalgar, Battle of, was fought off Cape Trafalgar on Oct. 21, 1805, between the British under Nelson and the French and Spanish under Villeneuve and Gravina. It was a complete victory for the British, but Nelson was killed.

Trafalgar Square. The site has often been referred to as the finest in Europe. It was conceived originally as a square by John Nash (1752–1835) when the project was considered of linking Whitehall with Bloomsbury and the British Museum. It was to be named after the new monarch as King William the Fourth's Square but on the suggestion of George Ledwell Taylor (a property owner near the site) alteration to the more popular name Trafalgar Square was agreed to by the King. On the north side the National Gallery was planned by Nash and erected by William Wilkins on the place of the Royal Mews—a work of William Kent a century before. The lay-out was the idea of Charles Barry but he did not approve the erection of the Nelson column (which see). His idea was for the square to have a grand flight of steps from the north side with sculptural figures of Wellington and Nelson but the Commons decided otherwise and the column as designed by William Railton was begun in 1840. The two fountains by Barry were supplanted in 1948 by ones designed (1938)

by Sir Edwin Lutyens. Executed in Portland stone they are flanked by some bronze sculptures. In the same year memorial busts of Lords Jellicoe and Beatty were placed by the north wall.

Transept, the portion of a church which extends across the interior between the nave and the choir.

Transistor. An electronic device consisting of a small piece of semiconducting solid (usually germanium or silicon) to which contact is made at appropriate places by three wires. The three parts resemble in function (not construction or behaviour) the cathode, anode, and grid of a thermionic valve, and transistors can perform many of the operations that valves have hitherto been used for in radio, television, etc. They possess several advantages over valves since there is no need for evacuated glass bulbs nor for a heated emitter to give off electrons. This leads to much greater compactness and economy as well as to a much longer life. Nevertheless, there are certain limitations to their use, and they are not yet suitable as substitutes for valves in all cases. The device was invented by the Americans Bardeen, Brattain, and Shockley in 1948.

Transubstantiation. *See* J43.

Treasure-Trove, a legal term applying to treasure (coin, bullion, gold or silver articles) found hidden in the earth or other place, for which no owner can be discovered. The treasure legally belongs to the Crown, but it is the practice to return to the finder all articles not required for national museums and to reward him with the full market value of such as may be retained. It is the duty of the finder to report to the Coroner for the district in which the find is made who holds an inquest to find whether the discovery be treasure-trove or no. In England concealment is a criminal offence. *See also* Wreck.

Tree Frog, occurs most commonly in America and Australasia. The common European tree frog is a brilliant green animal, the adhesive discs at the tips of its fingers and toes enabling it to cling to trees, etc., wth ease.

Tree Shrew, an arboreal insectivorous mammal of Asia belonging to the family *Tupaiidae*. Tree shrews are related to the shrews, though in appearance they resemble squirrels except for their sharply pointed snout. They occur in Borneo, Siam, China, and Malaya. Some zoologists classify them as primitive primates.

Trent, Council of, the longest and one of the most important in the history of the Roman Catholic Church, was convened to combat the doctrines of Martin Luther. It first sat in 1545, the last sitting being in 1563. At this Council the general policy, principles, and dogmas of the Roman Catholic Church were authoritatively settled.

Triassic *or* **Trias**, the earliest geological period in the Mesozoic era, which began some 225 million years ago. Triassic formations 25,000 ft. thick occur in the Alps. Modern insects were appearing, and also small reptile-like mammals. Other important Triassic animals were: dinosaurs, ichthyosaurs (marine reptiles), and pterosaurs (flying reptiles). *See* F34.

Tribunes, name assigned to officers of different descriptions in ancient Rome. The original tribunes were the commanders of contingents of cavalry and infantry. The most important tribunes were the tribunes of the plebs, first elected in 494 B.C. as the outcome of the struggle between the patrician and the plebeian orders. They held the power of veto and their persons were sacred.

Trichoptera. This is the insect order comprising the Caddis-flies. These are moth-like insects, having hairs on the wings. They are usually found fluttering weakly near water. The larvae are aquatic and are remarkable for the cases (caddis cases) which they build out of sticks, small stones, sand grains, and shells.

Tricolour, the flag of the French Republic since 1789, consisting of three nearly equal vertical bands of blue, white, and red (ratio 90 : 99 : 111).

Trilobites, extinct marine arthropods, most abundant in the Cambrian and Ordovician systems. Their appearance may be roughly described as resembling that of a woodlouse, and like that animal the trilobites were capable of rolling their bodies up into a ball.

Trinity. The Christian doctrine that God exists in three persons, all co-equal, and indivisible, of the same substance—God the Father, God the Son (who became incarnate as Jesus), begotten of the Father, and God the Holy Ghost, proceeding from Father and Son. The system denying the Trinity is Unitarianism (*see* J43).

Trinity House, on Tower Hill, London, was incorporated in 1514 as an association for piloting ships, and has ever since been entrusted with various matters connected with the regulation of British navigation. Since 1854 the lighthouses of the country have been under its supervision. The acting Elder Brethren act as Nautical Assessors in Marine causes which are tried by the High Court of Justice.

Triptych, a picture, carving, or other representation, with two swing doors, by which it could be closed in: frequently used as an altar-piece. Also a writing tablet in three parts, two of which folded over the one in the centre.

Trireme, an ancient vessel with three rows of oars of great effectuality in early naval warfare. Mentioned by Thucydides. It was a long, narrow vessel propelled by 170 rowers. The Romans copied it from the Greeks.

Trisagion ("thrice holy"), an ancient Jewish hymn, still regularly sung in the service of the Greek Church. A version of it—"Tersanctus"—also forms part of the Anglican Eucharistic service.

Tritium, a radioactive isotope of hydrogen which has three times the weight of the ordinary hydrogen atom. It is produced by bombarding an isotope of lithium with neutrons and has a half-life of 12½ years, decaying with the emission of β-particles (electrons).

Triumvirate, a term used to denote a coalition of three persons in the exercise of supreme authority. The first Roman triumvirate was that of Pompey, Julius Caesar, and Crassus, 60 B.C.; the second was that of Mark Antony, Octavus, and Lepidus, 43 B.C.

Tropic-Bird, a long-tailed sea bird, of which there are 3 species (the Red-billed, the White-tailed, and the Red-tailed), frequenting the tropical regions of the Atlantic, Pacific, and Indian oceans. They are commonly called Bo'sun Birds.

Troposphere. The atmospheric layer which extends from the earth's surface to the stratosphere. As a general rule the temperature in the troposphere falls as altitude increases. *See* Atmosphere.

Troubadours, lyric poets who flourished from the 11th to the end of the 13th cent., chiefly in Provence and the north of Italy. They were often knightly amateurs, and cultivated a lyrical poetry intricate in metre and rhyme and usually of a romantic amatory strain. They did much to cultivate the romantic sentiment in days when society was somewhat barbaric and helped considerably in the formation of those unwritten codes of honour which served to mitigate the rudeness of mediaeval days. *See also* Jongleurs.

Trouvère *or* **Trouveur**, mediaeval poet of northern France, whose compositions were of a more elaborate character—epics, romances, fables, and chansons de geste—than those of the troubadour of the south. Flourished between the 11th and 14th cent.

Truffles are subterranean edible fungi much esteemed for seasoning purposes. There are many species, and they are found in considerable quantities in France and Italy, less commonly in Britain. They are often met with under beech or oak trees, and prefer calcareous soils, but there are no positive indications on the surface to show where they are, and they are not to be cultivated. Hogs, and sometimes dogs, are used to scent them out, the former, by reason of their rooting propensities, being the most successful in the work.

Tsetse, an African dipterous fly belonging to the same family as the house-fly. It is a serious economic pest as it transmits the protozoon causing African sleeping sickness when it pierces human skin in order to suck blood, which forms its food. *See* Gammexane.

Tuatara or *Sphenodon punctatum*, a primitive lizard found in New Zealand. It has a rudimentary

third eye on the top of the head; this is called the pineal eye and corresponds to tissue which in mammals forms the pineal gland.

Tube Foot, the characteristic organ of locomotion of starfishes and kindred animals. They are arranged in pairs along the underside of the arms, and their sucker-like ends can grip a surface very tightly. The action of the suckers depends on hydraulic pressure.

Tudor Period extends from 1485 to 1603. The first Tudor sovereign was Henry VII., descended from Owen Tudor; then followed Henry VIII., Edward VI., Mary, and Elizabeth, the last of the line.

Tuesday, the third day of the week, named from the Saxon deity Tuisto, Tiw, or Teusco. To the Romans it was the day of Mars.

Tuileries, a French royal and imperial palace dating from 1564. It was attacked by insurgents during the outbreaks of 1792, 1830, and 1848, and was burned down during the Commune of Paris in 1871.

Tumulus, a mound of earth raised over the bodies of the dead. The mound of Marathon, enclosing the bodies of the Athenians who were killed in the famous battle with the Persians, is a celebrated tumulus. Such mounds were commonly raised over the tombs of the distinguished dead in ancient times, and sometimes enclosed heavy structures of masonry. The Roman "barrows" were tumuli. Evidences of such mounds are frequent in prehistoric remains.

Tuna *or* **Tunny**, a large marine fish belonging to the mackerel family, frequenting the warm waters of the Atlantic, Pacific, and Mediterranean. Tuna fisheries are an important industry.

Tundra, the vast barren treeless plains with small lakes and morasses lying in the arctic regions of northern N. America and northern Russia where the winters are long and severe and the subsoil permanently frozen. Sparsely inhabited by nomadic peoples—Lapps, Samoyeds, and Eskimos—who support themselves by hunting and fishing. The reindeer is domesticated and supplies most of their needs.

Tungsten, a hard, brittle metal, symbol W (it was formerly called wolfram), silver to grey in colour. Its chief ores are wolframite (iron and manganese tungstate) and scheelite (calcium tungstate). Tungsten is alloyed in steel for the manufacture of cutting tools; also in the non-ferrous alloy stellite (*q.v.*). Electric lamp filaments are made from tungsten. Tungsten carbide is one of the hardest substances known and is used for tipping tools.

Turbines propelled by steam provide power for the propulsion of many ships, and on land steam turbines are a principal source of power, being used in large central electricity stations, for instance, to convert heat energy into electrical energy. Gas turbines have recently come into use in aeroplanes, and gas-turbine railway locomotives are being developed. The first gas-turbine ship had its trials in 1947, just half a century after the first steam-turbine ship.

Turbot, a large flat fish, highly valued as food. It often attains from 30 to 40 lb. in weight. Its flesh is white and firm. It is confined to European waters, and is caught by line or trawl.

Turkey, a fowl of American origin, brought to Europe from America soon after the discovery of that country. It was a domesticated bird in England in the first half of the 16th cent.

Turpentine, an oily substance obtained from coniferous trees, mostly pines and firs. It is widely used especially in making paints and varnishes, and also has medicinal properties.

Turquoise, formerly called Turkey-Stone, is a blue or greenish-blue precious stone, the earliest and best specimens of which came from Persia. It is composed of a phosphate of aluminium, with small proportions of copper and iron. India, Tibet, and Silesia yield turquoises, and a variety is found in New Mexico and Nevada. It derives its name from the fact that the first specimens were imported through Turkey.

Turtle Dove, a summer visitor from Africa to southern England. It is a small, slender bird with reddish-brown upper parts, pinkish throat, black tail with white edges, and a repeated purring note.

Tweed. A rough-surfaced fabric of the twilled type, usually all-wool, though cheaper kinds may include cotton. Of a soft, open, flexible texture, it may have a check, twill, or herringbone pattern. Harris, Lewis, Bannockburn, and Donegal tweeds are well known. "Tweeds" is said to have been written in error by a clerk for "twills."

Twelfth Night is the eve of the feast of the Epiphany, and in olden times was made the occasion of many festivities. It was the most popular festival next to Christmas, but is now little observed.

Twilight is the light which is reflected from the upper portion of the earth's atmosphere when the sun is below the horizon (before sunrise or after sunset). The term is most usually understood to refer, however, to the evening light; the morning light we call dawn. The twilight varies in duration in different countries, according to the position of the sun. In tropical countries it is short; in the extreme north it continues through the night.

Tyburn, a former small tributary of the Thames, which gave its name to the district where now stands the Marble Arch, Hyde Park. Here public executions formerly took place.

Tycoon, the title by which the commander-in chief of the Japanese army (virtually the ruler of Japan) was formerly described by foreigners. (In Japanese *taikun* means great lord or prince.) The term is now applied, usually in a derogatory sense, to an influential business magnate.

Tympanum is, in architectural phraseology, the triangular space at the back of a pediment, or, indeed, any space in a similar position, as over window or between the lintel and the arch of a doorway. In ecclesiastical edifices the tympanum is often utilised for sculptured ornamentation.

Tynwald, the title given to the Parliament of the Isle of Man, which includes the Governor and Council (the Upper House), and the House of Keys, the representative assembly. This practically constitutes Home Rule, the Acts passed by the Tynwald simply requiring the assent of the Sovereign.

Typhoon. The tropical cyclone of the China Seas which brings winds of hurricane strength and torrential rains, most frequently in late summer or early autumn.

U

Uhlan, a light cavalry soldier armed with lance, pistol, and sabre and employed chiefly as skirmisher or scout. Marshal Saxe had a corps of them in the French Army; and in the Franco-German war of 1870 the Prussian Uhlans won fame.

Ultramarine, a sky-blue pigment obtained from *lapis lazuli*, a stone found in Tibet, Persia, Siberia, and some other countries. A cheaper ultramarine is now produced by grinding and heating a mixture of clay, sulphur, carbonate of soda, and resin.

Ultrasonics, sound waves of frequency so high as to be inaudible to humans, *i.e.*, about 12,000 cycles per sec. and upwards. Ultrasonic waves are commonly produced by causing a solid object to vibrate with a suitably high frequency and to impart its vibrations to the air or other fluid. The object may be a quartz or other crystal in which vibrations are excited electrically, or a nickel component which is magnetically energised. There are numerous technical applications, *e.g.* submarine echo sounding, flaw detection in castings, drilling glass and ceramics, emulsification. Ultrasonic waves are an important tool of research in physics.

Ultra-Violet Rays. These are invisible electromagnetic rays whose wavelengths are less than 3,900 A. (Angstrom = one-hundredth of a millionth of a centimetre). The sun's radiation is rich in ultra-violet light, but much of it never reaches the earth, being absorbed by molecules of atmospheric gases (in particular, ozone) as well as by soot and smoke particles. One beneficial effect of ultra-violet light on human beings is that it brings about synthesis of vitamin-D from certain fatty substances (called sterols) in the skin. The wave-lengths which effect this vitamin synthesis also cause sun tan and sun burn. Ultra-violet lamps (which are mercury-vapour discharge lamps) are also used for sterilising the air inside buildings, their rays

being lethal to bacteria. Many substances fluoresce under ultra-violet light: for instance, zinc silicate glows green, while cadmium borate throws out red light. This phenomenon is applied practically in fluorescent lamps, the light of requisite hue being secured by judicious mixture of the fluorescent materials which coat the lamp. *See* Electric Light.

Umbra, the full shadow of the earth or moon during an eclipse; the half shadow is called penumbra.

Uncials were a form of written characters used in times prior to the 10th cent.; while smaller than capitals they were larger than the later minuscule. The term uncial was a misapplication of St. Jerome's *literae unciales*, "inch-high" letters.

Unction, the act of anointing with oil, a symbol of consecration practised in the Roman Catholic, Greek, and other Churches, but not in the Protestant. *Extreme unction* is the rite of anointing a dying person with holy oil. This function consists in anointing the eyes, ears, nostrils, mouth, the palms of the hands, and the soles of the feet.

Underdeveloped Countries are countries in which primitive methods of production still largely prevail. Most of the population are peasants, carrying on agricultural pursuits on small-holdings without much use of capital, and the industrial production is largely in the hands of individual craftsmen working without expensive capital instruments. Many of these countries are now trying to carry through large plans of industrialisation but are severely hampered by lack of capital resources, as they need to import capital goods for which they find it difficult to pay with exports, especially when the "terms of trade" (*see* G6) are unfavourable to primary producers The need for capital imposes on such countries the necessity of a high rate of saving out of their national incomes; but this is difficult to enforce in view of the deep poverty of most of the people. They accordingly stand in need of help from the advanced countries, both with capital loans at low interest rates and gifts. *See* G10.

Unicorn, a fabulous single-horned animal. In heraldry its form is horse-like, with the tail of a lion and pointed single horn growing out of the forehead. In the Middle Ages the unicorn was a symbol of virginity.

Union of Great Britain and Ireland was proposed in the Irish Parliament in Jan. 1799 after the 1798 Rebellion and came into force on Jan. 1, 1801. The troubled history of Ireland, associated with the question of self-government, nationalism, land, and religion, culminated in the Easter revolution of 1916. A treaty giving the 26 southern counties independence in 1921, as the Irish Free State, was followed by a period of internal dissention. In 1937 a new constitution was enacted in Eire in which no reference was made to the Crown. This, however, left in force the External Relations Act of 1936 and with its repeal in 1948, Eire separated itself from the British Crown and thus severed the last constitutional link with the Commonwealth, and became an independent Republic.

Union, Treaty of, was the treaty by which Scotland became formally united to England, the two countries being incorporated as the United Kingdom of Great Britain, the same Parliament to represent both, Scotland electing sixteen peers and forty-five members of the House of Commons. Uniformity of coins, weights, and measures was provided for, Scottish trade laws and customs were assimilated to those of England, and as regards religion and the practices of the law, Scotland was to continue as before This Act was ratified on May 1, 1707.

United Nations. *See* **Section C, Part II.**

Universe in astronomy means not only the star system (of which the sun and planets are a small part) but all the countless star systems or nebulae which may be separated from each other by millions of light-years. *See* **F3–7.**

Universities are institutions of higher education whose principal objects are the increase of knowledge over a wide field through original thought and research and its extension by the teaching of students. Such societies existed in the ancient world, notably in Greece and India, but the origin of the University as we know it today lies in mediaeval Europe, the word *universitas* being a contraction of the Latin term for corporations of teachers and students organised for the promotion of higher learning. The earliest bodies to become recognised under this description were at Bologna and Paris in the first half of the 12th cent.; Oxford was founded by an early migration of scholars from Paris, and Cambridge began with a further migration from Oxford. Other Universities sprang up all over Europe, including three in Scotland—St. Andrews (1412), Glasgow (1451), and Aberdeen (1494)—which were followed by Edinburgh in 1582. These six bodies remained the only Universities in Great Britain until the foundation in 1826–29 of University and King's Colleges in London (resulting in the establishment of the University of London in 1836) and of the University of Durham in 1832. There are (1968) thirty-three Universities in England: Aston, Bath, Birmingham, Bradford, Bristol, Brunel, Cambridge, The City, Durham, East Anglia, Essex, Exeter, Hull, Keele, Kent, Lancaster, Leeds, Leicester, Liverpool, London, Loughborough, Manchester (including Manchester University Institute of Science and Technology), Newcastle, Nottingham, Oxford, Reading, Salford, Sheffield, Southampton, Surrey, Sussex, Warwick, York, in addition to the Royal College of Art, which under Royal Charter (1967) grants the degrees of Doctor, Master, and Bachelor of Art or Design (R.C.A.). Wales has one University (The University of Wales with Colleges at Aberystwyth, Bangor, Cardiff and Swansea) in addition to St. David's, Lampeter, which confers two degrees (in Arts and Theology), and the Welsh College of Advanced Technology, Cardiff, which is expected to be granted university status. Scotland now has eight (Aberdeen, Dundee (1967), Edinburgh, Glasgow, Heriot-Watt (1966), St. Andrews, Stirling (1967), and Strathclyde (1964), Britain's first technological University. Northern Ireland has two (Queen's University, Belfast, and the newly created University of Ulster. The number of students in the United Kingdom is expected to reach between 220,000 and 225,000 in 1971. Formed from colleges of technology, art and design, commerce, and other institutions, thirty polytechnics are to be established in England and Wales as centres of higher education. The Republic of Ireland has Trinity College, Dublin (founded in 1592), and the National University of Ireland, with its three constituent University Colleges at Dublin, Cork, and Galway. The 19th cent. also saw a wide extension of the University movement throughout the British Empire, the early important foundations being McGill (1821), Toronto (1827), and Laval (1852) in Canada; Sydney (1850) and Melbourne (1853) in Australia; New Zealand (1870); South Africa (1873); Bombay, Calcutta, and Madras n 1857 in India; and the University of the Punjab (1882) in the present Pakistan. Since the war a number of Universities and University Colleges have been instituted in Commonwealth countries—in the West Indies, in East and West Africa and Rhodesia, in Malaysia, India, and Pakistan. In the U.S.A. the development of higher education has left the Universities less sharply defined than in Europe and the Commonwealth, the best-known being Harvard, Yale, Princeton, Columbia, and Chicago. In England a certain emphasis has always been placed on the provision of residential facilities for students. The Universities receive aid from the State mainly in the form of direct grants from the Treasury made on the advice of the University Grants Committee, a committee appointed by the Chancellor of the Exchequer from people with wide educational and/or industrial experience. But they are self-governing institutions free from State control. *See also* **N28–33.**

University Boat-race. *See* **U35.**

Uranium, a metal, symbol U, discovered by Klaproth in 1789 in pitch-blende. It is a white metal which tarnishes, readily in air. Great developments have followed the discovery that the nucleus of the uranium isotope U^{235} undergoes fission, and uranium minerals have become very important since it was found that atomic

energy could be released controllably by taking advantage of fission. Previous to the second world war the uranium content of all the uranium ores that were mined was estimated at 1,000 tons. Before atomic energy work began to take the major part of the world's output of uranium minerals, the chief users of uranium compounds were the ceramics and textile industries. *See also* **Nuclear Reactors, Nuclear Fission, F12(1).**

Uranus. This planet was discovered by Herschel in 1781. Its diameter is 32,000 miles and its average distance from the sun is 1,783 million miles. It has five small satellites.

Urea, the final product in mammals of the breakdown of nitrogenous waste, *e.g.*, excess amino-acids. It is very soluble in water and is excreted in urine. In 1828 Wohler synthesised urea from inorganic matter. This was the first laboratory synthesis of an organic substance and refuted the idea that living creatures or life force are necessary to create such substances.

Ursa Major, the Greater Bear, or "Charles's Wain," a constellation familiar to all observers because of the brilliance of the seven stars forming its outline. It never sets in these latitudes.

Ursa Minor, the Lesser Bear Constellation, has, like Ursa Major, seven prominent stars, of which the pole star is the brightest.

Utopias. *See* **J43.**

V

Vaccination, a system of inoculation against small-pox discovered by Dr. Jenner in the 18th cent. In Great Britain it is usual for all infants at the age of three months to be vaccinated unless the parent conscientiously believes that it would be harmful to the infant's health. *See* **P11(2).**

Valency. A term used by chemists to describe the combining ability of an element with respect to hydrogen. Thus oxygen, which forms water, H_2O, with hydrogen is said to have a valency of two, nitrogen (forms ammonia, NH_3) three, and carbon (forms methane, CH_4) four. Chlorine forms hydrogen chloride, HCl, and is said to be monovalent. This empirical approach cannot account for valency in such compounds as carbon monoxide, CO, which appears to require both elements to have the same valency. With the discovery of the electron it was realised that the concept of valency and chemical bonds is intimately concerned with the electronic structure of atoms, and theories have been advanced to explain why the same element can have different valencies in different compounds. Iron, for example, can have a valency of two ($FeCl_2$, ferrous chloride) or three ($FeCl_3$, ferric chloride). *See* **N34.**

Valentine's Day, the 14th Feb., is a festival in celebration of St. Valentine, one of the Christian martyrs of the 3rd cent. A sweetheart or Valentine is chosen on that day and letters or tokens sent secretly to the object of affection.

Valhalla, in Scandinavian mythology, is the special Paradise to which the souls of warriors slain in battle were transported. The term is also generally used to designate a burial place of great men.

Valkyries, the chosen handmaidens of Odin, appointed to serve at the Valhalla banquets. Their most important office, however, according to the Norse mythology, was to ride through the air at a time of battle and point out the heroes who were to fall. It is one of these Valkyries who is made the heroine of Wagner's opera "Die Walküre."

Valve, an electronic device consisting of two or more metal plates (electrodes) usually enclosed in an evacuated glass bulb. One of the electrodes is heated causing electrons to be emitted. If a positive voltage is applied to the other electrode, the electrons will move towards it and the valve must conduct electricity. The current will only flow in one direction as the electrons are emitted only from one electrode. A valve with two electrodes is called a diode, but by putting in one or more intermediate electrodes the flow of current can be sensitively controlled and the valves are then called triodes, pentodes, etc., according to the total number of electrodes in them. Valves have found extensive applications in amplifiers, rectifiers, oscillators, and many electronic devices, but are now being superseded by transistors in many applications where it is advantageous to have greater reliability, smaller power consumption, and smaller size.

Vampire *or* **Werewolf,** according to ancient superstition, was a spectre in human form which rose from its grave in the night-time and preyed upon the living as they slept, sucking their blood, and then returning to the grave.

Vampire-Bats, blood-eating bats of tropical America. They puncture the skin with their incisor teeth, leaving a wound that bleeds profusely. The blood is lapped up by the bat, not sucked.

Vanadium, a scarce metallic element, symbol V, whose chief ores are carnotite and patronite. Some iron ores contain it. Most of the vanadium commercially produced finds its way into vanadium steels, which are used for tools and parts of vehicles, being hard, tough, and very resistant to shocks. The oxide is used as a catalyst in industry, especially in making sulphuric acid.

Van Allen Belts. One of the most remarkable discoveries made during the I.G.Y., 1957–58, was that the earth is surrounded by a great belt of radiation. Evidence came from *Sputnik II* (which carried the dog Laika) and from the American satellites, *Explorers I* and *III*. The American scientist, J. A. van Allen, was able to explain the puzzling data collected from these satellites. Subsequent observations with deep space-probes showed that there are in fact two zones of high intensity particle radiation surrounding the earth, one concentrated at a distance of about 1,000 miles, the other at about 15,000 miles. A close relation exists between the shapes of the zones and the earth's magnetic field. Recent evidence suggests that Jupiter also is surrounded by a dense belt of trapped energetic particles. *See* **Earth's Magnetic Field, Section F, Part IV.**

Varnish is of two leading kinds: spirit varnish, made from resinous substances dissolved in spirit; and oil varnish, in which the dissolving agent is linseed oil and turpentine.

Vatican, the Papal residence at Rome, a famous palace on the hill adjacent to St. Peter's. Its museum is a rich treasure-house of literary and artistic objects.

Vauxhall Gardens, a famous London pleasure resort from the early part of the 18th to the middle of the 19th cent. It was here that many great singers appeared, where the earliest balloon ascents were made, and where there were fine displays of fireworks.

Vein. *See* **Lode.**

Venus, the brightest of all the planets, whose orbit lies between that of Mercury and the earth, second in order from the sun (*see* **F6**). It can approach the earth to within 25 million miles. At wide intervals Venus passes across the sun's disc ("transit of Venus"). The first transit was recorded in 1639, since then four have occurred, in 1761, 1769, 1874, and 1882, and the next is due in 2004. In common with all the other planets it moves around the sun in the same direction as the earth, but is the only one that rotates about its axis in the opposite direction. The planet takes just under 225 earth days to complete an orbit round the sun. In 1967 Russia succeeded in soft-landing an instrumented canister from their *Venus IV* research spacecraft. Measurements gave a picture of a very hostile environment—high surface temperature, a very high atmospheric pressure, an atmosphere 15 times denser than on earth of almost pure carbon dioxide. *See also* **F7.**

Venus Fly-trap, a well-known insectivorous plant (*Dionaea muscipula*) occurring in Carolina in damp mossy places. It is related to the Sundew. The leaf is the organ that catches the insects. The leaf blade is in two halves, hinged along the centre line. Each half bears three sensitive hairs called "trigger hairs." When an insect touches a trigger, the two halves of the leaf clap together, trapping the insect between them, when it is digested by a secretion (digestive enzymes) from the leaf, which afterwards absorbs the soluble products.

Vernalisation. Seeds which, after being exposed to a low temperature, produce plants that flower

earlier than usual are said to have been "vernalized." This technique of seed treatment devised by Lysenko is called vernalization. It is claimed to have been widely used in Russia to obtain cereal crops in places where climatic conditions are favourable for only a short season.

Versailles, Treaty of. The Peace Treaty, 1919, ending the first world war. The first half was devoted to the organisation of the League of Nations. Among the territorial changes Germany ceded Alsace-Lorraine to France, Posen and the Corridor to Poland. Germany undertook to disarm, to abolish universal military service, to keep only a small army of 100,000 and a small navy. Her colonies were to be shared out among the Allies under League Mandates. Reparations were to be paid, but were gradually reduced and entirely ceased in 1932. Hitler took unilateral action against the Treaty especially in regard to rearmament and the annexation of Austria. Hitler's attempt to change the eastern frontiers was the immediate cause of the Second World War.

Victoria and Albert Museum, in Kensington, London, was begun in 1852 as the Museum of Ornamental Art at Marlborough House. The present building was completed in 1909, and has the following nine departments: Architecture and Sculpture; Ceramics; Engraving, Illustration and Design; Metalwork; Paintings; Woodwork; Textiles; Library (of books on art) and Book-production; and the Dept. of Circulation. The Bethnal Green Museum is a branch of the V. and A.

Victoria Cross, an order of merit for conspicuous valour, awarded to members of the Army, Navy, and Air Force, was established in 1856. In July 1959 it was announced that all holders of the V.C. for whom the British Government is responsible would receive a tax-free annuity of £100.

Vienna Congress, sat at Vienna from Sept. 1814 to June 1815, and settled the delimination of the territories of the various European nations after the defeat of Napoleon. The Treaty of Vienna which resulted gave Ceylon, Mauritius, Cape Colony, Heligoland, Malta, and part of Guiana to England; France was not permitted to hold more territory than she had possessed at the outbreak of the Revolution in 1789; Austria took Northern Italy; Russia part of Poland; and Prussia, part of Saxony and the Rhenish province. Except for one or two changes the clauses of the treaty were maintained for over forty years.

Viet-Minh, the Indo-Chinese (Annamite) national movement led by Ho Chi-Minh which resisted French rule from 1945 to 1954, when Vietnam was partitioned as a result of the Geneva Conference. The National Liberation Front of South Vietnam is called the Viet Cong.

Vikings. Scandinavian pirates who from the 8th to the 10th cent. were the terror of northern waters. Sometimes the Viking raids reached south to the Mediterranean and east to the White Sea, and they ventured as far as Greenland and North America. Their leader Rurik founded the first Russian kingdom of Novgorod. They excelled in shipbuilding, were fine sailors and splendid craftsmen.

Vinegar. This condiment and preservative is a weak solution of acetic acid (3–9%) formed by the oxidation of ethyl alcohol by the action of bacteria on alcoholic liquor (wine, beer, cider, fermented fruit juices, or malted cereals). Wine vinegar is usually red; malt vinegar is brown. The name vinegar is derived from the latin *vinum aigre*, bad wine. *See also* Acetic Acid.

Vinyl Plastics are polymers made from derivatives of ethylene, examples are polyvinyl chloride (P.V.C.), which is used in making plastic pipes and kitchen utensils, among other things; polyvinyl acetate used in the paint industry and in bonding laminated articles like plywood; and polystyrene (poly vinyl benzene) used in making electrical fittings and for lenses.

Viper, a family of poisonous snakes of which there is one example in Britain, the common viper or adder, only found in very dry localities.

Virus. *See* P7.

Visibility is defined by the distance at which the farthest of a series of objects, specially selected to show against the skyline or in good contrast with their background, can be distinguished. Visibility depends chiefly upon the concentration of water or dust particles suspended in the air. Instruments are available to measure the obscurity of the atmosphere more directly, including that at night. A large lapse rate of temperature and a strong wind are favourable to good visibility; a small lapse rate, calm or light wind favourable to bad visibility. Fog is when the visibility is less than 1,100 yds.; mist or haze when it is between 1,100 and 2,200 yds. *See* Pollution.

Viscount, a title of rank coming between that of Earl and Baron. The title originally stood for deputy-earl. The first English Viscount was Viscount Beaumont, created in 1440.

Vitamins, name of a group of organic substances found in relatively minute amounts in certain foodstuffs, essential for growth and the maintenance of normal bodily structure and function. The Hungarian biochemist Szent-Györgyi, who first isolated vitamin C or ascorbic acid, defined the vitamin as "a substance that makes you ill if you don't eat it!"

Volcanoes are vents through which magma reaches the surface as lava flows, or as the solid products, *e.g.*, ashes and bombs, of explosive eruption. The vent may be cylindrical or it may be a long fissure. The former type usually builds up cones, *e.g.*, Vesuvius. Notable active volcanoes are Etna, Vesuvius and Stromboli, in Italy; Hekla in Iceland; and Mont Pelée in Martinique. The last-named was in violent eruption in 1902, when the chief town of St. Pierre was completely destroyed. Volcanic eruptions are sometimes linked with brilliant sunset phenomena, *e.g.*, the Pacific island of Krakatoa (1883), whose atmospheric and tidal effects were recorded all over the world, and Agung on the island of Bali (1963), which had been dormant for 120 years. A new fissure volcano (Surtsey) developed off the coast of Iceland in 1963.

Vole. There are three species of British vole; the Field-vole, the Bank-vole, and the Water-vole.

Volt, the electromotive force unit, named after Alessandro Volta (1745–1827), and defined in terms of the coulomb, the second, and the joule.

Vraic, a name for seaweed in the Channel Islands, where it is extensively used as a manure.

Vulgate, a term used to designate the Latin version of the Scriptures sanctioned by the Council of Trent.

Vulture, a famous bird of prey of two distinctive groups; that of the Old World, whose nostrils are separated by a bony partition, and the New World vulture, which has no such division. Vultures feed on carrion and are the great scavengers of tropical regions. The European species are the Egyptian vulture, Griffon vulture, Black vulture, and Bearded vulture. Vultures have no feathers on the head and neck.

W

Wading Birds, *Charadriiformes*, an order of migratory, long-legged, long-billed birds, frequenting marshes and shallow waters. They include the plovers, avocets, stilts, oystercatchers, curlews, phalaropes, godwits, dunlins, sandpipers, redshanks, greenshanks, snipe, woodcocks, the pratincole of the Mediterranean, and the sun bittern of tropical America. Many species breed in Britain.

Wagtails, familiar long-tailed small birds, the most common British species being the Pied or Water (with sub-species White) Grey and the Yellow (sub-species Blue.) Wagtails nest in holes and are active of habit.

Walloons, name given to the French-speaking population of the southern provinces of Belgium, in contrast to the Flemings or Dutch-speaking population of the northern provinces. The Walloon areas contain the mining and heavy industries of the country; the Flemish regions are more agricultural. Walloons number *c.* 3 million, Flemings *c.* 5 million. The *Mouvement Populaire Wallon* desires an autonomous Wallonia within the Belgian state.

Walpurgis Night, the night before May 1st, when witches and creatures of evil are supposed to have liberty to roam. Named after St. Walpurgis, an English nun, who went on a mission

to Germany in the 8th cent. There is a famous Walpurgis night scene in Goethe's *Faust*.

Walrus, a very large marine mammal, related to the seals having in the upper jaw two large curved tusks, which average in length from 15 in. to 2 ft. It lives on bi-valve molluscs, and inhabits the Arctic seas. An adult walrus can exceed 12 ft. in length and weigh over a ton.

Wapentake, the ancient name given in the northern counties to territorial divisions corresponding to the Hundreds of southern counties.

Warblers, a family of small, lively song-birds closely related to the flycatchers and thrushes. Represented in Britain by about 36 species, including the chiffchaff, one of the earliest spring visitors, willow-wren, wood-warbler, blackcap, garden-warbler, whitethroats, sedge- and grasshopper-warbler.

Water is the simplest compound of hydrogen and oxygen. It is formed when an electric spark is passed through a mixture of the gases, and is a product of combustion of all hydrogen-containing compounds, *e.g.*, petrol, coal, coal gas, and wood. Water is essential to living matter, and is the medium which carries food to animals and plants. Salts in hard water may be removed by distillation of the water or by a process known as ion-exchange (water softening). Pure water freezes at 0° C. and boils at 100° C. and is used as a standard of temperature on this scale. It has a maximum density at 4° C. Heating water above 100° C. converts it into steam, which is used under pressure to convert heat energy into useful work, as in electrical power stations and steam engines. Water gas is a mixture mainly of carbon monoxide and hydrogen formed by blowing steam and oxygen through red-hot coke: it is used as a fuel. Water is one of the very few compounds which freezes from the surface down rather than from the bulk of the liquid up. This property has important consequences on the preservation of life in rivers and lakes when they are frozen over.

Water Hyacinth (*Eichhornia crassipes*), a beautiful aquatic plant native to Brazil which has spread to other favourable equatorial regions of the world causing havoc on account of its abnormal rate of reproduction away from its natural environment. In recent years it has invaded the Nile and the Congo, forming vast floating carpets which block the channels, clog the paddles of river craft and de-oxygenate the water, killing the fish. It is being held in check by spraying with the herbicide 2,4D.

Waterloo, Battle of, was fought on June 18th, 1815. The Allies (British German, and Dutch) under Wellington and Blücher defeated the French under Napoleon. This ended Napoleon's career.

Waterloo Bridge, crossing the Thames, was built by Rennie, and opened in 1817. It had nine arches, each of 120 ft. span, was built of granite, and had a length (including approaches) of 2,456 ft. The present bridge, completed in 1942, and formally opened Dec. 10, 1945, is a fine example of reinforced concrete construction. (Architect, Sir Giles Gilbert-Scott.)

Water-Spider, an interesting little animal which spins a sac of silk on a water-plant, which it uses as a sort of diving bell Into this bell it introduces bubbles of air, one at a time; thus the spider is enabled to remain below the surface a considerable time.

Waterspout, whirling tornado-like cloud, occurring at sea. It begins as a cone of cloud tapering slowly downwards, the sea surface becoming disturbed; on reaching the centre of the cloud of spray the spout takes on the appearance of a column of water. A number of these vortices may form fairly close together at about the same time, their duration ranging up to 30 minutes.

Watling Street, the name of the old Roman road which ran from the Channel ports by way of London to Shropshire. *See also* Roman Roads.

Watt. A unit of electrical power equivalent to 1 joule of work per second, named after James Watt (1736–1819). 1 horsepower = 745·7 watts. *See* N14.

Wax, the name applied to certain substances or mixtures which are solids having little crystalline form and may be regarded as solidified oils. They are used for various purposes, such as the making of wax candles, bleaching, and making artificial flowers and anatomical models, also in pharmacy for blending in the composition of plasters, ointment, etc. The best-known natural wax is beeswax, and there are others, such as spermaceti, obtained from the sperm whale, and Chinese wax, which is a cerotyl cerotate.

Waxbill, a small Oriental and African bird of the *Estrildidae* family, with wax-like bill and beautifully variegated plumage. The Java sparrow, and the Blue-breasted waxbill are attractive, and often find their way into cages.

Ways-Goose, the name given to a festive gathering of people employed in printing and other works, so called from the fact that in earlier times a goose was the principal dish of the feast.

Weasel. A carnivore mammal found in Britain, smallest member of the group including the Stoat, Polecat, and Pine-marten, about 8 in. long. Its fur is reddish on the upper side of the animal, white on the under side; it may all turn white in winter with the exception of the tail.

Weather, the factors determining to-morrow's weather are so manifold, variable, and complex that the task of the meteorologist is no easy one. There are still people who cling to the idea that weather is determined by the phase of the moon, but their predictions have no scientific backing, and can be dismissed. Changes in temperature, humidity, and speed of air masses can best be measured by instruments designed for the purpose. By taking into account the peculiar character of any part of the country, whether coastal, high- or low-lying, industrial, sheltered, precise forecasts for that particular region can be made up to twenty-four hours ahead and sometimes longer. We need to know more about the heat exchange between oceans and the atmosphere before long-range forecasting is possible. The British Isles lie in the path of depressions moving north-eastward across the Atlantic. It is the frequency, intensity, and speed of these centres of low pressure, which give these islands such changeable weather. On the other hand, when an anticyclone builds up and embraces the British Isles, settled weather is fairly certain, the type of weather, whether dull or cloudless, warm or cold, depending mainly on the direction of the wind in the particular area concerned and the time of year. An American earth satellite, *Vanguard II*, was launched in Feb. 1959 to serve as the first "weather-eye" in space.

Weather Lore. Before instruments were invented to measure atmospheric conditions, man relied on his own observation of wind and sky, behaviour of birds and animals, and came to associate certain phenomena with types of weather. Many popular weather rhymes have survived the centuries, and as long as forecasting is confined to the next 24 hours there is perhaps something to be said for them, particularly those dealing with the winds. What is very unlikely is that next year's summer can be predicted from this year's winter, or that one month's weather is related to that of another. The study of past records reveals too many exceptions for such predictions to be of much use in forecasting.

Weaver Bird, the popular name for a large group of finch-like birds belonging to the family *Ploceidae*, found principally in Africa but also in Southern Asia, Australia, and Europe and remarkable for their habit of building nests formed of blades of grass dexterously interwoven and suspended from the boughs of trees.

Weaving has been practised since before any times of which we have record. The Egyptians credit the invention to Isis, the Grecians to Minerva. The main principle of the weaving loom is the same to-day as it was thousands of years ago; a warp extends lengthwise through the loom, the threads being held in separate regular order by being passed through a reed or "slay," while the weft is crossed through alternating threads of the warp by means of a shuttle which holds the weft. Thus the fabric is built up. Weaving was done by hand up to the early part of the 19th cent., when Cartwright's steam-power loom was introduced, and is now in universal use. The Jacquard loom for weaving figured designs dates from 1801.

Wedding Anniversaries are: first, Cotton; second, Paper; third, Leather; fourth, Fruit and Flower; fifth, Wooden; sixth, Sugar; seventh

Woollen; eighth, Salt; ninth, Copper; tenth, Tin; twelfth, Silk and Fine Linen; fifteenth, Crystal; twentieth, China; twenty-fifth, Silver; thirtieth, Pearl; thirty-fifth, Coral; fortieth, Ruby; fiftieth, Golden; sixtieth, Diamond; sixty-fifth, Blue Sapphire; seventieth, Platinum.

Wednesday, the 4th day of the week, derived its name from Woden or Odin, the Norse god of war.

Weights and Measures. *See* N12–14.

Welding is a means of joining together two pieces of material, often metals, by heating the joint until the substances melt locally, run together, and then solidify. The heating can be by burning gas (*e.g.*, oxy-acetylene welding) or electric current (electric arc welding). Techniques exist for welding anything from hair-like wires to massive steel plates. *See* Soldering.

Werewolf, a man or woman, who according to mediaeval belief, could be turned by witchcraft or magic into a wolf, eat human flesh or drink human blood, and turn into himself again. This belief was widely held in Europe, and similar superstitions prevail among most primitive peoples, *e.g.*, the "leopard man" of certain African tribes. Lycanthropy (from Gr. = wolf-man) is a form of madness in which the patient imagines himself a beast.

Westminster Abbey stands on the site of an old church and Benedictine foundation of the 7th cent. It was rebuilt under Edward the Confessor, and again under Henry III., and important additions were made by Edward II., Edward III., Richard II., Richard III. and Henry VII., the latter erecting the beautiful eastern chapel in the perpendicular style which bears his name. The western towers and front were rebuilt by Wren in the 18th cent. It contains tombs of many sovereigns, of the Unknown Warrior, and many other illustrious men are commemorated by monuments.

Westminster Cathedral, seat of the Roman Catholic Archbishop of Westminster. It was designed by J. F. Bentley and built between 1895 and 1910. It is of red brick, in early Christian Byzantine style with a domed campanile, 283 ft. high, and a decorative interior.

Westminster Hall, adjoining the Houses of Parliament, was built as a Banqueting Hall by William Rufus, and many courtly festivals were held there in succeeding centuries. King John established the Law Courts there. It now forms a gigantic hallway, leading to the Houses of Parliament. Charles I., Sir Thomas More, and Warren Hastings were tried there.

Whale, a completely aquatic mammal; the fore-limbs are modified to form fin-like paddles and there is virtually no external trace of the hind-limbs. There are two major groups of whales—the *Toothed Whales*, including the Sperm-whale (Cachalot), Dolphins, Killer-whales, and Porpoises; and the *Whalebone Whales*. In the latter a series of whalebone plates grow down from the roof of the mouth, and, being frayed at their edges into a hairy fringe, together constitute a filtering mechanism. The animal takes in sea water containing minute organisms on which it feeds; the mouth is then closed and the tongue raised when the water is forced out through the filter, on which is left the food. As the tongue is lowered, the whalebone plates straighten up, flicking the food on to the tongue, which transfers it to the gut. Most whale oil is obtained from the thick layer of fat under the skin (blubber), but in the Sperm-whale there is a large reserve of oil in the head. The oil is used for making candles, margarine, and soap. Ambergris used in perfumery comes from the intestine of whales. The number of whales that may be killed in a season is limited by International Convention.

Whimbrel, a bird of the Curlew family, more common in Scotland than in England.

Whinchat, a small migratory bird, a breeding visitor to Britain (Apr. to Oct.); bright brown plumage, with prominent eye stripe.

Whirlwind, a sudden circular rush of opposing winds, which often causes much damage.

Whiskers in physics and materials science (*q.v.*) are tiny rods of crystal, thinner than human hair and perhaps half an inch long. Their importance lies in the fact that such crystals are free from the defects described on F17. They are also free from surface cracks and steps. This means they are immensely strong because failures of strength in ordinary solids are due to imperfections and cracks of one kind or another. Large numbers of whiskers of strong solids like graphite, silicon, or silicon carbide embedded in a matrix of softer matter such as plastic or metal would make a very strong new material. Many laboratories are developing such substances.

Whisky, an ardent spirit distilled from malt or other grain, and containing a large percentage of alcohol. It has a greater consumption than any other spirit, and is of many kinds, Scotch and Irish whiskies being chiefly consumed in this country, and being of pot still or patent still production, or a blend of the two. Whisky is the most heavily taxed product; in 1661 a duty of 4*d*. a gallon was imposed, today the duty is £10 10*s*. 10*d*. on a proof gallon. American whiskies are mostly distilled from corn (maize), or rye. *See* Alcohol.

White Elephant, a term in common use to designate a gift that causes the recipient more trouble or cost than it is worth; derived from an old-time custom of the Kings of Siam who presented a white elephant to a courtier whom it was desired to ruin.

Whitehall Palace, built within sight of Westminster by Hubert de Burgh, Earl of Kent, round about 1240, was the residence of the Archbishops of York until Wolsey presented it to Henry VIII in 1530. Thence-forward to 1697, when it was burned down, it continued to be the favourite town residence of royalty, and to the Stuarts especially it was a great centre of court festivities. In those days, with its grounds, it extended from the Strand to the river. The only portion of Whitehall Palace now standing is the Banqueting Hall built by Inigo Jones, on a scaffold projected from the front of which Charles I was beheaded. A block of new government buildings has recently been built on part of the site of the old Palace.

White House, the official residence at Washington of the President of the United States.

Whitsuntide, the festival celebrating the descent of the Holy Ghost and occurring seven weeks after Easter.

Whydah Bird, the widow-bird of Equatorial Africa. The Paradise Whydah is remarkable for the long tail and handsome black-and-scarlet plumage of the male during mating season.

Widow Bird, certain species of African weaver birds with predominantly black plumage. In the breeding season the male birds are strikingly beautiful, with scarlet and buff markings and long tail feathers. They are social parasites and trick other birds into rearing their young.

Wigeon, a surface-feeding duck of northern Europe, known in Britain more as a winter visitor than a nesting bird. It feeds in flocks in the muddy estuaries and has a characteristic "whee-oo" call.

Willow, a water-side-loving tree of the genus *Salix*, to which the osiers belong. The best cricket-bat blades are made from a white willow, *S. alba* var. *caerulea*, a fine tree with bluish-green leaves, mostly found in Essex. Willow is also used for polo balls. Weeping willow, *S. babylonica*, is native to China and is the willow seen on Old China willow-pattern plates. It was introduced into England at the end of the 17th cent.

Wind, air set in motion by special atmospheric conditions, is of various degrees, from a slight rustling breeze to a hurricane. Winds are *constant*, as in trade winds or anti-trade winds; *periodic*, as in monsoons and other wind-visitations occurring according to influences of season; *cyclonic* and *anti-cyclonic*, when their motion is spiral; *whirlwinds*, *hurricanes*, and *tornados*, when high temperature and great density induce extreme agitation. Ordinarily, a wind is named from the point of the compass from which it blows, or it may be expressed in degrees from true north. The *sirocco*, the *mistral*, and the *simoom* are local forms of winds of great velocity. A *blizzard* is a biting blast of icy temperature. *See also* N33.

Windmills were in use in the East in ancient times, but were not much seen in Europe before the 13th cent. Wind sawmills were invented by a Dutchman in the 17th cent., and one was erected

near the Strand in London in 1633. Great improvements have been made in these mills, especially in the United States, where, by the application of the windshaft principle, much space is saved and the mills can be used for pumping, grinding, and other purposes.

Windows (Old Norse *vindauga* = wind-eye), an opening in a wall of a building to admit light and air, and to afford a view of what is outside. In northern Europe windows, as the derivation of the word implies, were first used for ventilation and glass was not used in private houses before the end of the 12th cent. In early Gothic (12th cent.) windows were still small and narrow, with rounded heads. In Early English (13th cent.) they became longer and the heads pointed. In the Decorated period (14th cent.) windows were mullioned (divided by slender bars into panes) and the pointed heads often traceried. In Tudor times when the Renaissance had found its way to England, windows were larger and the bay-window (projecting from the wall) and the oriel window (*q.v.*) were much in vogue; in the late 18th cent. curved bays (called bow-windows) became fashionable. Sash windows (invented by the English) with wooden frames and divided into equal rectangular panes were used in Queen Anne and Georgian houses. Their design was influenced by a passion for symmetry; they were very efficient ventilators. The French window reaches to the floor and has double casements opening as doors. A Dormer window is a vertical window set on the sloping side of a roof. One of the main features of modern architecture is the large area devoted to windows a development made possible by improved heating systems. Windows are now mass-produced in stock sizes and patterns.

Windsor Castle, the famous British royal residence on the banks of the Thames, as it now stands, was mainly built by Henry III., though a royal residence had existed there from the time of the Conqueror. Additions were made by Henry VIII., Elizabeth, and Charles II. Windsor Park and Forest comprise over 13,000 acres.

Wine, the fermented juice of the freshly-gathered grape. There are innumerable varieties, each obtaining its distinctive character from the species of wine producing the grape, the locality of the vineyard, method of cultivation, etc. Wines are of three main kinds: *sparkling*, as in champagne, due to their having been bottled before fermentation is complete; *beverage*, when the must has been fermented out before bottling. Such wines include the famous red and white wines of Burgundy, Bordeaux and the Rhone valley and the white wines of the Rhine Moselle and Loire valleys. Wines are *fortified* by the addition of alcohol either before fermentation (*e.g.* sherry) or during fermentation (*e.g.* port). The principal wine-producing areas of the world are: France, Italy, Algeria, Spain, Portugal, Rumania, Argentine, Yugoslavia, U.S.S.R., Greece, Germany, Hungary. The alcoholic content of wine varies widely, but is usually in the range 8–20% by volume.

Wirebird, a species of plover confined to St. Helena where it is protected.

Witan *or* **Witenagemot**, the name given to the Great Council of the Anglo-Saxons, "the Council of the Wise Men," and composed of the leading nobility.

Witchcraft. *See* J45.

Woad, a plant (*Isatis tinctoria*) that in olden days was largely used in England for the blue dye obtained from the leaves. It is a biennial plant belonging to the same family (*Cruciferae*) as the wallflower and is still cultivated in some parts.

Wolves, well-known carnivorous animals still found in many parts of Europe, but not existing in Britain since the middle of the 17th cent. They usually hunt in packs.

Woodcock, a wading bird, greatly valued for its flesh. It is a member of the snipe family, and breeds in Britain. The parent bird is able to carry its young between its thigh and body when flying to and from the feeding spots. It is one of the birds protected by the Game Laws.

Woodpecker, a familiar tree-climbing, insectivorous bird of conspicuous plumage, of which three species are found in Britain, the green woodpecker or yaffle (because of its harsh cry), the great and lesser spotted woodpeckers. They build in the hollows of trees. Yaffle has a long sticky tongue for licking up ground insects, especially ants. The other two obtain insects by digging into tree trunks with strong, chisel-like bills, spearing the insects with a sharp tongue. The metallic drumming sound made by the birds in spring is thought to be caused by their beaks hammering away at some hard resounding substance.

Wood's Metal, an alloy with a very low melting point (65° C., which is under 150° F.) so that a spoon made of it will melt when used to stir a cup of tea. Contains bismuth 4 parts, lead 2 parts, tin 1 part, cadmium 1 part. Its use as a heat exchanger has now been largely superseded by silicone oils, which have a wider temperature range.

Woodworm. Four beetles are mainly responsible for woodworm damage: common furniture beetle (*Anobium punctatum*), powder post beetle (*Lyctus brunneus*), death watch beetle (*Xestobium rufovillosum*), and house longhorn beetle (*Hylotrupes bajulus*). Particular attention should be paid to wood in damp, dark, and out-of-the-way places, and the backs and underneaths of furniture. The most frequent cause of woodworm damage is the common furniture beetle (*q.v.*).

Wool is a fibre, made up of very long protein molecules. It has been largely grown and used in the manufacture of cloth in England since before the Roman invasion. It is grown on the backs of sheep, and is of various kinds, according to the breed of sheep from which it is derived. Wool differs from hair in that it has a wavy, serrated fibre, its curl being a notable characteristic, whereas hair has a smooth surface comparatively free from serratures. Long wools are mostly used for the manufacture of worsted goods, and short wools for woollen cloths, though the improvements in machinery in recent years have enabled manufacturers to utilise short wools to a great extent for dress fabrics as well as for woollens. The finest wools are obtained from the fleece of the Spanish merino sheep. Australia, New Zealand, and the Argentine are the greatest wool-producing countries.

Woolsack, the name given to the seat occupied by the Lord Chancellor in the House of Lords. It is a large square bag of wool, without back or arms, covered with red cloth. At the time when it was first used, in the reign of Edward III., wool was the great staple commodity of the country and, it is said, chosen for the seat of judges as a constant reminder of the main source of the national wealth. The Lord Chancellor is said to be "appointed to the woolsack."

World Council of Churches. *See* J45.

World Population. According to the United Nations Statistical Yearbook (1967), the world's estimated population in 1966 was 3,356,000,000, an increase of 61 million since a year before. At this rate world population is likely to double by the year 2000. Nearly three-quarters live in the under-developed countries, half in Asia. Different countries are at different stages in a demographic transition from the stability provided by a combination of high birth rate and high death rate to that provided by a combination of low birth rate and low death rate. Their recent population history and current trend of growth, the age-structure of their population, and consequently their population potential for the near future are all widely different. By the beginning of the Christian era world population is believed to have been 200–300 million, rising to about 500 million by 1650, and it is estimated that about one in 25 of all human beings who have ever lived are alive today.

Wreck, the name given to trove found under water, usually from a maritime wreck. Finds must be brought to the notice of the Official Receiver of Wrecks, an officer of H.M. Customs and Excise.

Wren, a family of small passerine birds possessing upturned tails and most abundant in South America. The British species is an interesting singing bird with a surprisingly loud note for its size.

X

Xenon a rare gaseous element, symbol Xe, occurring in minute quantities in the atmosphere, discovered by Sir William Ramsay and M. W. Travers in 1898. *See* **Rare Gases.**

X-Rays were discovered in 1895 by Professor Röntgen, of Wurzburg, while experimenting with a Crookes vacuum tube, when the fact was accidentally revealed that a photographic plate, contained in a dark box and exposed to its rays, was affected. To the X-rays the box was transparent. X-ray photographs are now commonly taken to obtain information about objects enclosed within solid bodies; they enable bullets and any solid bodies of metal, as well as bones, etc., in the body to be perfectly located and investigated. The discovery has proved of great advantage in surgical operations. X-rays are used to determine the structure of matter; the atoms in a substance may be located and their relative positions determined by photographing reflections of the X-rays by the specimen. *See* **F11(1), 13(2).**

Xylem, the woody tissue of higher plants whose function is to conduct water and mineral salts upwards, and to provide mechanical support.

Y

Yacht, a light vessel now much used for pleasure trips and racing. The first yachting club was the Cork Harbour Club, started about 1720; and in 1812 the Royal Yacht Squadron was founded at Cowes. The Royal Thames Yacht Club dates from 1823. The most famous international yachting trophy is *The America's Cup* (*q.v.*). *See also* **U32.**

Yak, a curious, long-haired ox, found in Tibet, used as a beast of burden, and also kept for milk and meat.

Yard, a standard measu e of 36 in., the word being derived from the Saxon gyrd, or rod. The yard and pound are now defined by reference to the metre and the kilogram: yard = 0·9144 of a metre; pound = 0·45359237 of a kilogram. By international agreement the metre is defined by reference to the wavelength of Krypton-86 light. *See* **N12.**

Yellowhammer, a common British bird of the bunting family, of lemon-yellow and brown plumage. Nests on or near the ground.

Yeomen of the Guard are a body of Foot Guards established in the reign of Henry VII. for the protection of the Royal Person. Yeomen are now about 100 in number, and their duties consist in being present on ceremonial State occasions, the yearly distribution of Maundy Money, and the searching of the vaults of the Houses of Parliament on Guy Fawkes' day. "Beefeater" is the nickname of both Yeomen of the Guard and Yeomen Warders of the Tower, and they both wear the style of dress of the Tudor period, but with one distinction, the Yeomen of the Guard wear a cross belt, the Warders do not.

Yeti, opinions differ as to whether this is a mythical inhabitant of the Himalayas, a primitive primate or bear. Evidence to date is inconclusive.

Yoga. *See* **J45.**

York Minster, one of the oldest and finest of English cathedrals, is 524 ft. long, its nave is 240 ft. broad, and the central tower is 216 ft. high. The present edifice, in parts, dates back to the 12th cent., but a church stood on the site in the 7th cent. In 1829 it was set on fire by a lunatic named Jonathan Martin, and the destruction that then took place cost £60,000 to restore.

Ytterbium, a chemical element discovered by Urbain in 1907; one of the group of rare earth metals.

Yttrium, a chemical element discovered by Mosander in 1842. It is found in a few rare minerals such as gadolinite, xenotine, fergusonite, and euxenite. One of the group of rare-earth metals.

Z

Zamboni Pile, a dry galvanic battery, which can provide small amounts of high-voltage current over a very long time. At Oxford a couple of Zamboni piles have kept a bell ringing for over a hundred years. These piles in the second world war were perfected and produced in quantity, being the most convenient source of current for infra-red signalling devices.

Zebra, an African quadruped of whitish-grey colour, with regular black stripings, perhaps the most beautiful member of the Equine family. Rather larger than an ass and smaller than the horse, it has a tufted tail, is of light build, wild, and fleet of foot; there are several species, and the Quagga and Burchell's Zebra (ground colouring yellow), as well as the True Zebra, belong to the group.

Zen Buddhism. *See* **J46.**

Zenith, the highest point in the heavens above an observer's head, the opposite pole to the Nadir.

Zero, the cypher signifying nothing. The West is indebted to the Arabs for it, who probably got it from the Hindus and passed it to European mathematicians towards the end of the Middle Ages. The zero has also been found in Babylonian cuneiform. The Greeks had no such symbol, which hindered the development of their mathematics. The use of zero led to the invention of decimal fractions and to the later developments in astronomy, physics and chemistry. Absolute zero on the temperature scale is the lowest temperature theoretically possible (when no heat whatever is present) and equal to −273·15° C.

Zinc, a familiar metallic element, symbol Zn, known to the ancients, and used by them in the making of brass. It occurs as the sulphide, carbonate, etc. The ores of zinc are crushed, roasted, and reduced with coal. In combination with copper it constitutes the familiar alloy called brass, and zinc itself is much used for roofing and other protective purposes. Zinc ores are mined in Canada, the U.S.A., Mexico, Poland, Australia, Russia, Italy, Spain, and many other parts of the world. Zinc smelting is carried on in most industrial countries, including Great Britain.

Zionism. *See* **J46, C13(2).**

Zirconium, metallic element, symbol Zr, was discovered by Klaproth in the sand of the rivers of Ceylon in 1789. The crystalline metal is white, soft, and ductile; in its amorphous condition it is a blue-black powder. Zirconium is used in atomic reactors as containers for fuel elements, since it does not absorb neutrons.

Zodiac, an imaginary zone or belt of the sky enclosing the circuit over which the principal planets travel. It is divided into 12 equal spaces of 30 degrees each, comprising respectively the 12 signs of the zodiac—Aries, Taurus, Gemini, Cancer, Leo, Virgo, Libra, Scorpio, Sagittarius, Capricornus, Aquarius and Pisces. The idea of the zodiac originated with the Babylonians about 2000 B.C. and passed by way of the Greeks to the Western world.

Zodiacal Light, a faint cone of light occasionally seen stretching along the zodiac from the western horizon after evening twilight or the eastern horizon before morning twilight. It is believed to be due to the scattering of the sun's light by dust particles in orbit round the sun and extending beyond the earth. Recent observations at the high altitude station at Chacaltaya in the Andes suggest that the dust is travelling round the sun in regular planetary orbits.

Zonda, a warm moist wind in Argentina of great velocity blowing from the north or northwest, and, like the Sirocco in Southern Europe, causes much discomfort. It happens when a depression is moving across the pampas, bringing with it a mass of air from the humid tropics. It is followed by a refreshing wind from the south-east.

Zoological Gardens of London were opened in 1828, and belong to the Zoological Society of London. They contain one of the largest and most varied collections of living animals in the world. The Society maintains an open-air zoo at Whipsnade, on the edge of Dunstable Downs; this was opened in 1931.

Zoology, the science of animal biology, treating of the structure, classification, and distribution of the various members of the animal kingdom.

Zoroastrianism. *See* **J46.**

NOBEL PRIZE WINNERS (1901–1967)

Year.	Physics.	Chemistry.	Physiology and Medicine.	Literature.	Peace.
1901	W. C. Röntgen (G).	J. H. van't Hoff (D).	E. v. Behring (G).	R. F. A. Sully Prudhomme (F).	H. Dunant (Sw), F. Passy (F).
1902	H. A. Lorentz (D), P. Zeeman (D).	E. Fischer (G).	R. Ross (B).	T. Mommsen (G).	E. Ducommun (Sw), A. Gobat (Sw).
1903	H. Becquerel (F), P. Curie (F), Marie Curie (F).	S. Arrhenius (S).	N. R. Finsen (Da).	B. Björnson (N).	Sir W. R. Cremer (B).
1904	Lord J. W. S. Rayleigh (B).	W. Ramsay (B).	I. P. Pavlov (R).	F. Mistral (F), J. Echegaray (Sp).	Institut de Droit International.
1905	P. Lenard (G).	A. v. Bayer (G).	R. Koch (G).	H. Sienkiewicz (P).	Bertha von Suttner (Au).
1906	J. J. Thomson (B).	H. Moissan (F).	C. Golgi (I), S. R. y Cajal (Sp).	G. Carducci (I).	T. Roosevelt (A).
1907	A. A. Michelson (A).	E. Buchner (G).	C. L. A. Laveran (F).	Rudyard Kipling (B).	E. T. Moneta (I), L. Renault (F).
1908	G. Lippmann (F).	E. Rutherford (B).	P. Ehrlich (G), E. Metchnikoff (R).	R. Eucken (G).	K. P. Arnoldson (S), F. Bajer (Da).
1909	F. Braun (G), G. Marconi (I).	W. Ostwald (G).	T. Kocher (Sw).	S. Lagerlöf (S).	A. M. F. Beernaert (Be), Baron d'Estournelles de Constant de Rebecque (F).
1910	J. D. van der Waals (D).	O. Wallach (G).	A. Kossel (G).	P. Heyse (G).	The Bureau International Permanent de la Paix, Berne.
1911	W. Wien (G).	Marie Curie (F).	A. Gullstrand (S).	M. Maeterlinck (Be).	T. M. C. Asser (D), A. H. Fried (Au).
1912	G. Dalén (S).	V. Grignard (F), P. Sabatier (F).	A. Carrel (A).	G. Hauptmann (G).	E. Root (A).

LITERARY COMPANION

TABLE OF CONTENTS

I. THE CONTEMPORARY NOVEL

This section discusses novels written in English and published since 1945. It consists of two parts: I. Introduction; II. Directory of Novelists.

The contemporary novel can best be appreciated if it is related to the nineteenth century novel from which it has evolved and from which, in some respects, it differs. In the Introduction that follows we summarise some of the most important characteristics of the work of some English, American and French novelists of the nineteenth and early twentieth centuries and describe some of the intellectual, literary, and social ideas that seem to have affected novelists writing today.

I. INTRODUCTION.

The Nineteenth Century.

(a) English Novels.

In the nineteenth century English novelists were members of a comparatively stable society with generally recognised codes of moral and social behaviour. The theme of almost all their work is the interaction between the individual and the community. The heroes and heroines of Jane Austen and George Eliot, of Dickens, Thackeray, and Trollope acquire self-knowledge as they learn to discriminate between what is genuine and what is false, what is good and what is evil in the people and institutions with which they are brought into contact. All these novelists are as much concerned with the presentation of society as with the presentation of the individual, and their novels contain naturalistic descriptions of the life and manners of their day. Dickens uses poetic symbols, like the fog in *Bleak House*, but symbolism is generally uncharacteristic of mid-Victorian fiction.

Exceptions to the general pattern are the poetic tragedies of Hardy and the work of Emily Brontë. Richard Chase, an American critic, has remarked that in technique and in its view of life *Wuthering Heights* has much in common with nineteenth-century American fiction. It is unique among English novels of its day in its lack of concern with society and its disregard of the accepted social and moral conventions. This may perhaps be a result of the peculiarly isolated circumstances of Emily Brontë's life.

Narrative in nineteenth-century English fiction is sequential and writers use the device of the "omniscient author," that is the novelist "stands apart from," "above," the action, commenting upon it and upon the characters, often addressing the reader directly. Even in novels written in the first person, like *Great Expectations*, one is aware of the author's viewpoint as distinct from that of the narrator.

(b) American Novels.

American novelists in the nineteenth century were interested in the presentation of the individual, rather than of society. This was natural in a nation composed of pioneers and exiles and their descendants, lacking any common cultural heritage. The heroes and heroines of Twain, Hawthorne, and Melville are themselves pioneers, or exiles from society, who must create their own worlds.

These novelists use the device of the "omniscient author" and of sequential narrative, but their techniques are in other ways different from those of their English contemporaries and characterised by use of symbolism and allegory, which are appropriate to their subjects and natural media of those whose ancestors included the New England Puritans.

Henry James (1843–1916).

James was as much an English as an American novelist and eventually settled in England, because his interests were more akin to those of European writers than to those of his compatriots, and America lacked the complex social and cultural life that he wished to portray in his novels.

He is often referred to as "The Master," for the scrupulous care with which he revised and polished the style of his novels and short stories established an ideal of literary craftsmanship. The artistry and poetic sensitivity of his writing have had a marked effect upon the work of novelists such as Elizabeth Bowen, Rosamond Lehmann and L. P. Hartley.

James advocated the abandonment of the device of the "omniscient author," which he criticised as "muffling" the "process and effect of representation." He was, however, unable to devise a satisfactory alternative, so continued to it.

(c) French Novels.

Maupassant, Zola, and "Realism."

The aims of these two leaders of the French Realist school are stated in Maupassant's *Pierre et Jean*, and Zola's *Le Roman experimental*. They were to describe human beings in terms of their environment. The realists were conscious of the similarity between their intentions and those of the impressionist painters, and Zola is said to have aimed to describe a scene as Manet would have painted it.

As Maupassant and Zola treat individuals as characteristic products of their environments, they have found few close disciples among English and American novelists, who are inclined to emphasise the idiosyncratic aspects of personality. However, the realists' stress on detailed presentation of environment was generally influential on the work of novelists on both sides of the Atlantic between *c.* 1885 and *c.* 1914. Its effects may be seen in the writing of authors such as Bennett. There was to be a sharp reaction against this style by novelists of the coming generation.

As the realists were revolting against the conventional, bourgeois picture of society, they tended to emphasise the sordid and unpleasant sides of nineteenth-century life. It seems likely from reports that *The Last Exit to Brooklyn* (1967), is a work in this line of the realist tradition, and although there has been a general relaxation of censorship in the twentieth century, it is clear that the England of the 1960s still objects to "the unnecessarily faithful portrayal of offensive incidents" (*Daily News*, 1881).

The influence of this "slice of life" aspect of the writing of the realists has been pervasive and is recognisable in works as various as Mailer's *The Naked and the Dead*, Baldwin's *Another Country*, the novels of Angus Wilson, Braine's *Room at the Top*, Barstow's *A Kind of Loving*, and Sillitoe's *Saturday Night and Sunday Morning*.

It is difficult to judge how far the greater freedom in the treatment of brutality and of such subjects as sexual perversion, and in the use of blasphemy and obscenity in dialogue has been a result of the influence of the nineteenth-century realists and how far it may be attributed to the generally greater freedom of expression in the twentieth century as compared with nineteenth-century society. That novels should treat such subjects and include such language is, however, in keeping with the realist "slice of life" tradition.

The Early Twentieth Century.

(a) A New Vision of "Reality."

Lecturing in 1924, Virginia Woolf declared, "On or about December 1910, human nature changed." This was, of course, an exaggeration, but a great change was taking place in the intellectual climate of Europe during the early years of the century, a change reflected not only in the novels of Proust, Joyce, Lawrence, and Virginia Woolf herself, but in the poetry of Pound and Eliot, the music of Stravinsky, the dance of the Diaghilev Ballet and the paintings of the post-impressionists.

Virginia Woolf probably chose the date December 1910 because it was then that the first London exhibition of the work of the post-impressionists was opened. These artists expressed a new vision of "reality." A similar desire to find new, "more realistic" ways of writing animated the novelists of the new generation, and this is not surprising, for a new body of ideas was becoming available about aspects of life hitherto unexplored in the novel.

At the same time translations of the works of the great nineteenth-century Russian authors were appearing. Turgenev had been available in English since the 1890s. His works, together with those of Tolstoy, Dostoevsky and Chekhov, which were now being translated, were to heighten novelists' interest in conveying a more spiritual "reality," whilst the writings of Turgenev and Chekhov, in particular, combined with other influences to encourage a more lyrical treatment of style and form.

(b) The Influence of Freud and Others.

Freud and Jung lectured in America in 1910 and Freud's *The Interpretation of Dreams* appeared in English in 1913. His later works were to be published at the Hogarth Press by Leonard and Virginia Woolf. Freudian theory brought new dimensions to the study of character in the novel.

Prudery inhibited the presentation of erotic love in nineteenth-century fiction, though it had been treated with some freedom in the eighteenth. The work of Freud, and of more popular authors like Havelock Ellis, emphasised the importance of this aspect of human experience. Their work, and more recently that of writers like the American Kinsey, has encouraged greater freedom in the discussion of erotic love, and although in 1915 Lawrence's lyrical treatment of the instinctual life was viciously attacked, and *The Rainbow* suppressed as obscene, by the mid-1920s the presentation of sexual experience in fiction was acceptable, as may be seen from the novels of Huxley, although the freedom with which it could be treated has remained restricted in England, and *Lady Chatterley's Lover* was banned until 1960. The great difference between eighteenth-century and twentieth-century novelists' treatment of this subject is that while for the former it was a subject of, often ribald, comedy and satire, the latter rarely treat it humorously.

Freudian ideas on infantile sexuality aroused new interest in childhood experiences and the ways in which these might affect the adult, an interest reflected most notably in the novels of Hartley.

The theory of the Oedipus complex drew attention to the mother and son relationship and to how the adult could be affected by his having a possessive mother, an interest exemplified in Powell's study of Widmerpool (*A Dance to the Music of Time*), and in the novels of Angus Wilson and Ivy Compton-Burnett.

Explicit presentation of sexual inversion and perversion has only recently become acceptable in England, where it has found a place in the work of Wilson, Iris Murdoch, and Maureen Duffy. Baldwin's is the most imaginative treatment of homosexuality in American fiction.

Freud's work made clear the frailty of the barrier between rational and irrational behaviour and made possible an imaginative discussion of neurosis and insanity, regarded in the nineteenth century as degenerate or shameful. The interest in portraying such aspects of personality in literature was encouraged by the example of the work of Dostoevsky. The retarded, neurotic, or in other ways mentally disturbed person, has become almost a commonplace of contemporary literature, as, for example, in the novels of Faulkner, Patrick White, Bellow, Flannery O'Connor. The *Ha-Ha* (1961), Jennifer Dawson's sensitive study of a schizophrenic, is inconceivable as the work of any nineteenth-century novelist.

In general, Freud's writing drew attention to details of human experience and behaviour which, hitherto thought trivial, were now recognised as being of significance. His work aroused interest in the subconscious mind, in dreams and in the symbolic transformation of experience, giving new impetus to the use of symbolism in literature.

The turn of the century brought an upsurge of interest in the nature of perception. This was stimulated by works such as Bergson's *Matter and Memory* (1894), which emphasised the importance of memory in perception and, by William James's *Principles of Psychology* (1890), which compared consciousness to a "river or a stream," implying it carries within it submerged and floating memories and receives constantly changing patterns of impressions of the exterior world. Bergson also remarked that our impression of the world changed at every moment "as though by a turn of a kaleidoscope." He suggested that a novelist should aim to "reproduce the rhythm of thought." This implication that form should have a musical quality was to influence Virginia Woolf and E. M. Forster through the work of Proust.

(c) Innovators of Literary Techniques.

Marcel Proust (1871–1922).

The ideas of James and, particularly, of Bergson, profoundly affected the work of Proust, whose huge novel, *À la recherche du temps perdu* (1913–27) evokes the memories of a man's past life as they float into his mind. The novel has therefore been called a *roman fleuve*, a river novel. Its plot seems non-existent, but the work is in fact constructed with the greatest artistry. The poetic skill with which it conveys the kaleidoscopic patterns of memory considerably influenced the style of Virginia Woolf, while among contemporary novelists, Powell is Proust's avowed disciple.

James Joyce (1882–1941).

It has been suggested that Joyce, an Irishman, having created a new form for the novel, himself used it in every possible way. In *Portrait of the Artist* (1916) he covers the childhood and adolescence of a writer, in *Ulysses* (1922) he shows a day in the life of Dublin through the eyes of three people, and in *Finnegans Wake* (1939) the dreams of one night in the hero's life suggest the history of the world. Joyce has therefore a twofold significance for later novelists. He evolved a new kind of novel, but he wrote with such skill and imagination that authors have often despaired of emulating him; however, his achievements have encouraged others to experiment.

His name is particularly associated with the use of the "stream of consciousness" technique. The term is derived from William James. Describing his aims in evolving this device, Joyce said, "I try to give the unspoken, unacted thoughts of people in the way they occur." He was, in fact, seeking a verbal equivalent for non-verbal experience, as well as for verbal thought, and his sentences have often a poetic, rather than discursive logic. In the hands of an author who lacks poetic imagination this technique can result in dull and formless writing, as it did in Dorothy Richardson's *Pilgrimage* (1915–35). One of the most successful novelists to follow Joyce's use of the technique was Virginia Woolf. Most later writers have employed a less poetic version of it which would be more appropriately named the "stream of thought" technique, as it is used to express verbal thought, rather than "consciousness." A novelist who has adapted the technique in this way is Bellow.

Narrative in the first person has long been an alternative to that presented through the "omniscient narrator." The most notable early novel written in the first person was Sterne's *Tristram Shandy* (1760–67). The presentation of the story from shifting points of view has an even longer history. Richardson did this in *Clarissa* (1748), although the full development of this form of narrative was effected by Wilkie Collins in *The Moonstone* (1880), and Conrad used it in his masterpiece *Nostromo* (1904).

Joyce, however, gave new impetus to the use of these forms of narrative. He fulfilled the Bergsonian ideal that "there should be nothing left but two minds which, without the presence of the author, vibrate sympathetically." It seems it may be partly as a result of Joyce's influence that almost all novels are now written from the viewpoint of one or a few characters, but see below (The Present Day).

(d) Other Outstanding Novelists of the Early Twentieth Century.

D. H. Lawrence (1885–1930).

Lawrence had a vivid appreciation of the beauty of natural life and emphasised, like Freud, though in a different way, the importance of the instinctual, as opposed to the intellectual life. He is the exemplar of Bergson's artist—"the flag-bearer of intuition in its interminable struggle against logic and reason"—a true heir of the Romantic Movement (J39).

"In us the creative instinct became will. In order to grow beautifully like a tree, we have to attain a peaceful self-unity in which the creative will is retransformed into instinct" (Hammerskjöld, *Markings*). These words perfectly express Lawrence's attitude, and he felt it was only through basic human experiences, particularly through the experience of unselfish, erotic love that we could attain that peaceful self-unity that comes from an apprehension of the sacramental quality of life. For Lawrence, therefore, erotic love was not an end in itself, but a mode of apprehension. This may be seen from his portrayal of the life of Tom and Lydia Brangwen in *The Rainbow*, and the contrast he draws between it and the life of Anna and Will, which he suggests becomes bestial rather than human.

As he was interested in *relationships* between people, Lawrence needed a different technique from that evolved by Joyce. He therefore adapted the techniques of the nineteenth-century English novelists, and into a form which has much in common with theirs he introduced the poetic symbol. As Walter Allen has remarked, "This enabled him to render the felt quality of the immediate instinctive self as it had never been before."

No novelist has equalled Lawrence in the tender, poetic expression of unselfish, erotic love, but his ideas have been widely influential. A recent novelist whose work has emphasised, as Lawrence's did, the unhappiness and sterility of selfish relationships, is Doris Lessing. The American Baldwin also reflects his influence.

E. M. Forster (b. 1879).

Like Lawrence, Forster is a moralist, primarily interested in relationships between people. Thus he uses techniques and a novel form that have much in common with those of the Victorians. A much more sophisticated novelist than Lawrence, Forster is, superficially, a writer of social comedy in the tradition of Jane Austen, but he is always aware of the numinous quality of life, and expresses it in his novels through complex symbols. His books explore individuals' attempts to "connect" with each other across "the divisions of daily life" in a mutual quest for truth. These ideas, which are stated, rather than successfully conveyed in symbolic terms in his early novels, find poetic expression in his masterpiece, *A Passage to India* (1924), through episodes such as the visit to the Malabar caves and the Hindu festival, while the Indian setting exemplifies the "divisions of daily life" and provides ample scope for the writer of witty social comedy.

Lawrence died in exile. Forster, although he is still alive, has written no novels since 1924, saying, "I had been accustomed to write about the old-fashioned world with its homes and its family life and its comparative peace. All that went, and though I can think about the new world I cannot write about it."

The "new world" is the theme of Huxley's writing.

Aldous Huxley (1894–1963).

Huxley was unique among the novelists of the inter-war years. He declared that nothing deserved to be taken seriously save the suffering men inflict upon themselves by their own crimes and follies, and he criticised both the traditional "social" novel of personal relationships and the more poetic individualism of Joyce, Virginia Woolf, *et al.*, as reflecting conventional values that create suffering and help to perpetuate misery. Although Huxley's highly intelligent satires are very different in style from those of any other twentieth-century writer, his themes look forward to those of some of the more important post-war novelists.

Franz Kafka (1883–1924).

A Czech by birth, Kafka wrote in German. His novels first became known to the English-speaking world on the appearance of a translation of *The Castle* in 1930. It was followed in 1935 by *The Trial*. These haunting parables of a man's nightmare life in a world where everything appears contingent, now seem prophetic, and their influence is apparent in works like Rex Warner's *The Aerodrome* (1941), Orwell's *1984*, Ellison's *The Invisible Man*, and the novels of Beckett. Surrealist techniques, giving an effect of confusion between the world of consciousness and that of dream, had been used before Kafka, but he gave them fresh significance.

His tragic short story, *Metamorphosis*, which tells of a man who wakes one day to find himself transformed into a huge insect, brought new dimensions to serious science fiction.

The Present Day.

Some critics have suggested that there are no great novelists now, that the period of creativity which produced the work of Joyce, Virginia Woolf, Lawrence, and Forster in England, and of Faulkner in America, ended with the publication of *Finnegans Wake* and *Between the Acts* (1941). All these novelists were adult at the beginning of the First World War. They grew up in a world of "comparative peace," and, with the exception of Faulkner's, most of their best work was produced during the exhilaration of the 1920s. The world of those who were young at the time has also passed and few writers of the 1930s—the most notable were Huxley, Elizabeth Bowen, Henry Green, Joyce Cary, and Faulkner—have produced anything of significance since 1945. Antony Powell, Ivy Compton-Burnett (some would add the names of Greene and Waugh) are exceptional.

The great depression, the Spanish civil war, the rise of Nazi Germany made life seem increasingly precarious, and now man lives amid the pressures of urban industrial society beneath the threat of nuclear war. As Professor Kermode has recently remarked, there is nothing new in the feeling that ours is an age of crisis and that the Apocalypse is at hand, but the sense of impending doom has been given new force in our time by many people's feeling that all life is contingent. Whereas in the past men have found reassurance and hope in religious faith this has now become impossible for many. Some find their faith undermined by the fact that anthropology has illuminated the kinship between Christian rituals and those of Primitive cults,

while others are influenced by psychological theories that suggest all religious beliefs are rationalisations of subconscious desires. Dr. Paul Tillich suggests that, in this situation, increasing numbers of people are taking refuge in "democratic conformism"—seeking safety as part of the group and trying to suppress their own individuality from a deep-seated fear of drawing attention to themselves. (The pressure towards such "conformism" is increased during periods of economic crisis, when jobs are precarious, and at times of international tension, when the expression of ideas different from those of the group may lead to one's being thought subversive, or even branded as a traitor, as happened during the period of McCarthyism in America.) Tillich feels that as a result of the movement towards "conformism," the lives of many people in America and Britain are becoming virtually indistinguishable from those of the inhabitants of totalitarian states. It is significant that such a view of contemporary life was foreshadowed by Kafka, Huxley, and Orwell and is now reflected most impressively, because it is expressed poetically, in the later novels of Samuel Beckett, whose heroes live in fear of an elusive, possibly non-existent, tyrant.

Beckett is a supreme exponent of the themes of isolation, bewilderment, and suffering which are to be found in the works of so many contemporary novelists, of poets like Robert Lowell and Sylvia Plath, of painters such as Francis Bacon. These artists are not necessarily pessimistic people themselves. The artist aims to achieve an objective expression of feeling. His purpose is revelation, not propaganda. To achieve objective expression of feelings such as these requires not only great artistry, but much courage.

Conclusion.

Contemporary novelists are experimenting with a variety of forms, but in general their work approaches more closely to that of the nineteenth-century American tradition than to that of the Victorian novel as developed and modified by Lawrence and Forster. It is suggested that this is partly attributable to the interest aroused in individual experience by the work of Bergson, Freud, James, *et al.*, but is more particularly a reflection of life in the contemporary world, in which many men feel exiles.

Novelists have therefore continued to use and modify the techniques evolved by writers in the early part of the century. They have recently been criticised for doing so, for, while these techniques have given the novel a more dramatic and poetic intensity than was possessed by those of most Victorian writers, they have also restricted its vision of the world to that of one or a few characters.

The problems facing the contemporary novelist who aspires to evolve a new form of novel is therefore twofold: on the one hand a new vision of the world is called for, a vision that can encompass the bewilderment and suffering of our age and yet remain hopeful, and on the other hand, new techniques must be discovered to express this vision. As may be seen from the development at the beginning of the century, the two are complementary.

It is possible that the novelist who will evolve this new form is yet unknown. Of the writers whose work is discussed below, the authors from whom it seems most likely to come are Baldwin, Bellow, Golding, Naipaul, and Patrick White.

II. DIRECTORY OF NOVELISTS.

In this part we discuss the work of some of the more important novelists who have published since 1945. It is inevitably selective. A more detailed treatment of the twentieth-century American and English novel may be found in Walter Allen's *Tradition and Dream* (P). Some helpful studies of individual authors are available in Oliver and Boyd's paperbacked series *Writers and Their Critics.*

Except for the later novels of Beckett, dates quoted are those of the first publication. The dates of the first English-language editions of Beckett's novels are given.

Paperback editions are referred to thus: C: Calder and Boyars. Co: Corgi. F: Faber and Faber. Fo: Fontana. FS: Four Square. P: Penguin. Pa: Panther.

James Baldwin (b. 1924). *See also* **Section I.**

Baldwin emphasises the harsh brutality of contemporary life, particularly for the American Negro. One of his dominant themes is the necessity for honesty about oneself; this includes a frank acceptance of one's sexual nature, whether heterosexual or homosexual. He suggests the brutality of modern life is due to the fact that many people, especially, though not only, White people, are afraid of themselves and therefore incapable of accepting or loving others, but fear them and sadistically exploit and attack them. He shows the tragic effects of such viciousness upon those who suffer it and also upon its perpetrators. Much of the distinction of Baldwin's work comes from the compassionate understanding with which he treats the latter. He acknowledges the discovery and acceptance of oneself may involve great suffering and always requires courage, and suggests it is only possible if one is willing to love others and accept the support of their love.

Go Tell It on the Mountain. 1954. Co.

The novel covers two days in the lives of a Negro family who belong to a strict fundamentalist sect, The Fire Baptised. The members of this fellowship identify themselves with the Israelites in captivity. Baldwin shows how this is a reaction to the harshness of their lives and compassionately reveals the mixture of genuine and deluded religious experience among the sect's members. The language of the novel is permeated by echoes of the Authorised Version of the Bible.

Giovanni's Room. 1956. Co.

This is a tragic story of a young American who fears his homosexual predilections and hideously ruins the lives of his Italian lover and of his own fiancée.

Another Country. 1962. Co.

The novel is centred on the lives of a mixed racial group of Greenwich Village artists and intellectuals. The brutality of New York life is reflected in the crude and obscene language the characters use so casually. At the end of the novel five of its central figures are, as the title suggests, on the verge of a new, though not necessarily easy, life, after their difficult and often bitter quest for love and self-knowledge.

In each of these novels Baldwin uses a mixture of straightforward narrative and "flash-back" techniques.

Samuel Beckett (b. 1906). *See also* **Section I.**

Readers should begin with the early novels: *Murphy*, 1938 (C); *Watt*, 1953 (C), written during the years 1942–4 when the author, attached to the Resistance, was in hiding in France. Beckett now writes in French, re-creating his works in English. His merits as a novelist are controversial, but some critics, among them J. Fletcher, who compares Beckett with Sterne, find him "supremely entertaining."

An erudite man, Beckett delights to enrich his writing with subtle allusions to the works of a variety of other authors. In this he resembles T. S. Eliot, and, like Eliot's, Beckett's allusions are often esoteric. The writers to whom he refers most frequently include Dante and Saint Augustine. The form of Beckett's novels has been influenced by the work of Joyce, whom he knew, and also, and most particularly, by his study of Proust.

Poetic in structure and use of language, his later novels haunt the reader's imagination. Each is the monologue of a crippled old man lost in a hostile, terrifying, incomprehensible world which he endures with wry heroism—a world in which life seems a grotesque, bitter farce and God a tyrant whose existence is possible but improbable.

The Trilogy—*Molloy*, Eng. pub. 1955, *Mallone Dies*, Eng. pub. 1956 (P), *The Unnamable*, Eng. pub. 1958.

In the first part of *Molloy* the bedridden speaker recounts his compulsive, futile quest for his mother; in the second, the tyrant Youdi sends a messenger, Gaber, to one Moran, ordering him to go and look for Molloy. Youdi's name, derived from the Arabic "Yahudi" (cf. Yahweh), is a French colloquialism for "Jew." "Gaber" suggests "Gabriel." Moran doubts Youdi's existence, but fears to disobey the order. He fails to discover Molloy. Molloy and Moran represent aspects of the same personality.

In *Mallone Dies* the bedridden Molloy-Moran-Mallone awaits death, "telling stories" about other personifications of himself.

The harrowing *The Unnamable* continues the hero's fruitless search for some understanding of his own identity.

How It Is. 1964.

Arranged in short passages of unpunctuated prose-poetry, this extraordinary work has the effect of nightmare delirium. The speaker, who is at first anonymous, is, it seems, in the throes of a mortal illness, and imagines himself naked, dumb, crawling through mud with a sack of tinned fish suspended from his neck until he meets another, Pim, in a similar condition. He tortures Pim until the latter speaks. By now the narrator has a name, Bom. Pim deserts Bom, who, posing the idea of life as a circle, or procession, of torturers and victims, awaits his own torturer.

Saul Bellow (b. 1915).

All the novels of this much praised American explore the question of how one may live a truly human life in the contemporary, urban society of "organisation man." Bellow feels it mistaken to think that earlier answers to the question "What makes a good life?" are adequate for the twentieth century. But the question remains, and he finds the answers of most modern writers unsatisfying. They have, he suggests, retreated into ivory towers, concentrating on producing formally perfect works of art, and rejecting the vital concerns of modern life.

Bellow is keenly aware of the pressures society exerts upon us, but he remains unquenchably optimistic. "I do not believe the human capacity to feel or to do can really have dwindled, or that the quality of humanity has degenerated."

Bellow has published six novels: *Dangling Man*, 1944, *The Victim*, 1947, *The Adventures of Augie March*, 1953, *Seize the Day*, 1956, *Henderson the Rain King*, 1959, *Herzog*, 1964 (all P.). Their heroes represent a variety of social types. Leventhal (*The Victim*) is a journalist who has known hardship and still feels insecure. Augie March, an illegitimate slum boy, has a variety of jobs, honest and dishonest, and ends as a dubious business representative. Wilhelm (*Seize the Day*) is a "broke," out-of-work salesman. The millionaire Henderson goes to Africa and inadvertently becomes Rain King of a primitive tribe. Herzog is a lecturer in the history of philosophy.

These men withdraw from society, which seems composed of "Machiavellians," "theorists," and "reality instructors" who believe only unpleasant facts are true. Each finds himself imprisoned by self-absorption, from which he longs to escape, though even in his worst moments he retains tenuous contact with people through his love of children, or, in Henderson's case, primitive people. The novels trace their heroes' progress towards an awareness of the brotherhood of man and a conviction that the significance of life is to be found "in the ranks with other people." Bellow never shows his heroes' attempts to put this belief into practice and none of his novels has a wholly convincing conclusion.

Refusing to give much attention to questions of form, he has yet to produce a novel that is a satisfying work of art, though his last book was more carefully constructed than his earlier ones.

Some of the finest parts of his novels are their realisations of the urban American scene and of the life of the Jewish immigrant community.

Though by no means an intellectual writer Bellow is a man of omnivorous learning which enriches all his work, and an exuberant, often highly comic novelist. Not infrequently verbose and undisciplined, occasionally overwhelming, his colourful, vernacular language has a vigour that at times recalls that of Nashe (1567–1601).

Elizabeth Bowen (b. 1899).

A stylistic artist in the tradition of James, Elizabeth Bowen is famed for the beauty of her descriptive writing and for her sensitive analyses of feeling. Her finest novels are *To the North*, 1932, *The House in Paris*, 1935, *The Death of the Heart*, 1938 (P).

Of her later novels, the best is *The Heat of the Day*, 1949 (P), a love story set in war-time London.

Ivy Compton-Burnett (b. 1892).

Miss Compton-Burnett is a highly conscious artist, who knows her limits and never exceeds them. Apart from an early, now rejected, work, she has published eighteen novels, the first, *Pastors and Masters*, in 1925, the last, *The Mighty and Their Fall*, in 1963. Largely written in dialogue, each deals with the claustrophobic life of a well-to-do middle-class household at the turn of the century. Miss Compton-Burnett's themes are those of Greek tragedy; her formal, decorous language is reminiscent of Jane Austen. The combination can be disconcerting.

Lawrence Durrell (b. 1912).

The Alexandria Quartet—*Justine*, 1956, *Balthazar*, 1958, *Mountolive*, 1958, *Clea*, 1960.

Some find the Quartet a most enjoyable novel, for others it is all but unreadable.

Its form, says Durrell, is based on the relativity proposition, the first three volumes, which give differing aspects and views of the characters' lives and motives, having a "spatial" relationship, the fourth, which continues the narrative more or less chronologically, representing time. The novel's construction thus resembles that of Faulkner's *The Sound and the Fury*, and has much in common too with works like Cary's Gulley Jimpson trilogy.

Durrell's apparent theme is erotic love, but his underlying interest is the relationship between art and life. He suggests life is significant only when interpreted by art. This attitude, rather than the form of his work, differentiates it from novels like Faulkner's and Cary's.

Durrell's volumes contain splendid passages, but too often in the novel as a whole his sensuous language seems merely florid and pretentious, his characters but flimsy inhabitants of a decadent fairyland. With its evocative scenes of the Delta countryside and of Alexandrian festivals, its cosmopolitan cast of lovers, brutal murderers, and aristocratic intriguers the Quartet seems an ideal subject for a Hollywood "spectacular."

Ralph Ellison (b. 1914).

The Invisible Man. 1952. P.

Ellison is an American Negro and former musician. This, his only novel, is poetic in its complex symbolism and compelling language, and in the intensity of its feeling.

We learn from the prologue that Ellison's hero is not only "invisible," but an "underground man," living in a cellar. He has affinities with the narrator of Dostoevsky's *Notes from the Underground*. The novel also recalls Kafka. Like Kafka's, its hero is anonymous, and his vividly recounted experiences have the quality of bewildering dreams, at times of nightmare. He tells of his life from the night he received a scholarship to the State Negro College, to the night of a terrifying Harlem race riot, when, fleeing from supporters of a deranged Black nationalist, Ras the Destroyer, he took refuge in the cellar.

One of the novel's central episodes is that in a paint factory hospital, where the hero is subjected to torturous experiments and there is talk of castrating him. Among other things, the episode signifies the way in which all the "scientists" he encounters exploit those in their power, attempting to force all life into rigid sterile patterns. "Life," he says, "is to be lived, not controlled." A free society is loving and infinitely various.

The hero realises the "scientists"—politicians, demagogues, and confidence men—are unaware of the limitations of their vision and cannot see they are destroying themselves as well as their dupes and victims. Images of blindness recur throughout the novel. The narrator calls himself "invisible" because he has come to feel people who look at him see only projections of their own imaginations. He realises he has been equally blind. One of the novel's themes is his gradual enlightenment as he learns to understand himself and others better—to see "reality."

William Faulkner (1897–1965).

The American Faulkner received the Nobel Prize for Literature in 1950. Although his last novel was published only three years before his death, most of his best work appeared between 1929 and 1936: *The Sound and the Fury*, *As I Lay Dying*, *Light in August*, *Absalom, Absalom!*. Together with the comic *The Hamlet*, 1940, these novels are his finest achievement.

Faulkner's post-war novels can be divided into three groups: (1) those which are simply enjoyable stories: *The Town*, 1957, *The Mansion*, 1959, which together with *The Hamlet* form the Snopes trilogy, and *The Reivers*, 1962; (2) *The Intruder in the Dust*, 1948 (P), which is too overtly didactic to be a successful novel, though of great interest to anyone concerned by the racial problems of the South; (3) two ritualistic novels: *Requiem for a Nun*, 1951 (P), and *A Fable*, 1954; the latter, set in France in early 1918, is constructed on an elaborate series of parallels with the events of Holy Week.

Faulkner's work is concerned almost exclusively with the Southern States and set in the mythological Yoknapatawpha County, Mississippi. A Southerner by birth, he is soaked in the history and legendary folklore of Mississippi. Although many of his most memorable characters are bizarre, tragic figures, subnormal poor-Whites, murderers, or other outcasts of society, his work reflects not only the grimness, the callousness and brutality of the South, but also the proud individualism, courage, humour, and vitality of its people. Thus one reads Faulkner with pleasure, despite the difficulties presented by his style.

These difficulties are at times inherent in his subject, as at the beginning of *The Sound and the Fury*, which is told from the viewpoint of a moron; in the touching episode in *The Hamlet*, when the idiot Ike Snopes steals a cow he loves; in the evocation of Charles Mallison's nightmare (*Intruder in the Dust*). Sometimes, however, Faulkner seems needlessly obscure; he indulges in turgid rhetoric; his sentences are often three or four pages long, sparsely punctuated and containing innumerable parentheses, and parentheses within parentheses. The effect of such clumsy syntax is utterly bewildering, and one sympathises with the exasperated critic who declared Faulkner a "genius without talent." Such criticism, however, ignores the comic aspect of Faulkner's work, his gift for racy, vernacular humour.

William Golding (b. 1911).

Golding's novels are poetic and, like all poems, cannot be fully appreciated on first reading. Essentially a religious novelist, he aims to write "total myths" illuminating contemporary life. To remarkable extent he has succeeded.

Golding has enormous technical virtuosity; no two of his works are alike, although they express the same vision—a vision of men without God as tragic figures who "seem unable to move without killing each other"; torture those they love; watch themselves becoming automata. But Golding suggests man can regain freedom and the state of grace in which "everything that lives is holy." Thus all his novels, except *Pincher Martin*, express not only the horror, but also the wonder and beauty of life.

Lord of the Flies. 1954. F. P.

Golding rewrites *Coral Island* in "realistic" terms, as an allegory of the Fall and an image of twentieth-century society that makes and drops atomic bombs.

The Inheritors. 1955. F.

This astonishing *tour de force* shows the advent of *Homo sapiens*, mainly through the eyes of the Neanderthal Lok. The measure of Golding's skill is not simply his brilliant evocation of the largely non-verbal world of Neanderthal Man, but his avoidance of sentimentality. He shows the inevitability of *Homo sapiens'* supremacy, and the tragedy in which it involves him, as well as Lok.

Pincher Martin. 1956. F. P.

This novel chronicles the struggles of a drowned sailor against God's overwhelming love. Made, like all men, in God's image, Martin is named Christopher. Alive he chose to "pinch" everything he could; dead, he refuses abnegation of himself, and therefore continues to exist, in a self-made Hell, on a rock he creates from the memory of a decaying tooth. Martin's struggles for "survival" are heroic, ghastly, futile.

Free Fall. 1959. F. P.

Sammy Mountjoy retraces his life, to discover when he lost his innocent delight in life and its beauty, and how he regained this. Containing fine passages, the novel is marred by the fact that Sammy interprets the significance of events, instead of the interpretation being left to us.

The Spire. 1964. F.

The narrative of this, Golding's masterpiece, centres on the building of the spire of Barchester (Salisbury) Cathedral. The cathedral symbolises three aspects of life: man suffering, crucified; man praying; erotic man.

Jocelyn, the Dean, believing himself divinely appointed to build the spire, presses for its completion with ruthless disregard of the suffering and death he causes. His motives are in fact mixed and largely unconscious. Gradually he recognises his hubris and the mixed motives behind his obsession, realising his wicked folly. Admitting on his deathbed he knows nothing about God, Jocelyn is granted a vision of His glory and the wonder of creation, as he gazes at the transfigured spire.

The Pyramid. 1967.

Set in Stillbourne, a small Wiltshire town, the novel is superficially a tragi-comedy of provincial life (its central episode is very funny) but on a deeper level *The Pyramid* is a searching exposure of materialism.

The novel's central images are musical ones. Various tastes in, and ways of performing, music signify various kinds of love and modes of life. The title suggests the social pyramid on which the townsfolk wish to rise, and also a metronome, to

whose rhythm, that of a selfish, class-ridden society, they choose to move like robots.

Nadine Gordimer (b. 1923).

The writing of Nadine Gordimer, a South African, is banned in her own country. She has published four volumes of stories and four novels. The last of the novels, *The Late Bourgeois World*, appeared in 1966. Nadine Gordimer is more successful as a short-story writer than as a novelist, for she seems to lack the power to develop character at any length. One is nevertheless compelled to admire her brave and outspoken criticism of the callousness of the South African regime, which makes the people of that country inhabitants of a " World of Strangers." The latter is the title and theme of her second novel.

Graham Greene (b. 1904).

Greene's best work is *The Power and the Glory*, 1940 (P). Since the War he has published five novels, apart from "entertainments": *The Heart of the Matter*, 1948, *The End of the Affair*, 1951, *The Quiet American*, 1955 (all P), *A Burnt-out Case*, 1961, *The Comedians*, 1966 (P). All have settings of topical interest: war-time London, the Congo, Vietnam, Haiti. Greene is skilled in evoking the squalor and discomfort of life in the tropics. His novels are traditional in form, influenced by the thriller and the film. He tells a good story, in terse, economical prose, yet often his novels seem both superficial and sentimental.

In the first two post-war volumes his treatment of character lacks objectivity: his thought is confused, and he fails to achieve artistic resolution of his religious beliefs and his feeling that life is a sordid struggle against impossible odds. *The Quiet American* and *The Comedians* which have no overtly religious theme are more successful.

L. P. Hartley (b. 1895).

Hartley is a professional novelist and craftsman in the tradition of James and Hawthorne, the latter his acknowledged master. Like Hawthorne's, Hartley's themes are moral, illuminated by skilful use of symbolism. In his best novels his style is humorous and gently ironical, but in others he lapses into sentimental melodrama.

Hartley seems at his happiest when writing of children and adolescents: a recurrent figure in his work is the delicate, overprotected, hypersensitive, and introspective boy, as in *Eustace and Hilda*, 1947, *The Go-Between*, 1953, *The Brickfield*, 1964. (The heroes of *The Boat*, 1950 (Co), and *The Betrayal*, 1966, are older, less successful versions of the same figure.) Hartley is skilled in evoking the atmosphere and scene of his characters' environment, particularly when the latter is East Anglia in the earlier years of the century, Oxford, or Venice.

Of the eleven novels he has published, the best are:

The Eustace and Hilda trilogy—*The Shrimp and the Anemone, The Sixth Heaven, Eustace and Hilda*. F.

The novel's theme is symbolised in the opening chapter when Eustace and Hilda, playing on the beach at Anchorstone (Hunstanton) try to rescue a half-eaten shrimp from an anemone. The former is an image of the self-sacrificing Eustace, the latter of his beautiful, possessive sister. " The effort to qualify for Hilda's approval " is the " ruling force in Eustace's life."

Hartley presents his hero with sympathy and humour. The novel follows Eustace to Oxford and Venice and ends with his return to Anchorstone, to the now paralysed Hilda. Counterpointing their mutually destructive relationship is the vital life of their sister, Barbara, and her husband.

***The Go-Between*. P.**

The innocent Leo, staying with the rich family of a school friend, acts as a messenger between the latter's sister and her farmer lover, who, like the rest of the characters, appear to him god-like figures.

***A Perfect Woman*. 1955.**

Save for their children Isabel and Harold have little in common. She finds him dull, but, an ardent reader of novels, believes herself aware of the dangers of indulging in romantic daydreams. Her boredom and dissatisfaction become clear when the handsome novelist, Alec, enters their lives after a chance meeting with Harold. Both wish for Alec's approval and friendship and together scheme to procure for him the barmaid of the local pub.

The voice of Isabel's conscience, symbolised in her son's shouts to his sister, " Janice, go back! ", constantly interrupts her daydreams of Alec, and the children's game with the doll, Pamelia, gives symbolic warning of the dangers of their parents' wicked scheme.

The full irony of Hartley's title becomes clear at the end of the novel, when the publication of Alec's new book provides another comment on his relationship with Isabel and Harold.

Hartley draws no crude distinctions between good and evil in this novel. Alec is an ambiguous figure, and, although, essentially, a bad man, he is also highly attractive, and it is by reading his book that Isabel attains some understanding of how complacent and wickedly foolish she has been.

Others of Hartley's novels, *The Boat, My Fellow Devils*, 1951, *The Brickfield*, and *The Betrayal*, have very similar themes to that of *A Perfect Woman*, but only in the treatment of Margaret, the heroine of *My Fellow Devils*, does he approach the objective sympathy which characterises his presentation of Isabel and Harold, and in none of these other novels does he make such subtle use of poetic imagery as he does in *A Perfect Woman, Eustace and Hilda* and *The Go-Between*.

Hartley's twelfth novel, *Poor Clare*, was due to be published in the spring of 1968.

Ernest Hemingway (1898–1961).

This controversial American was awarded the Nobel Prize for Literature in 1954. Hemingway's language and syntax are of extreme, at times monotonous, simplicity. He writes best of physical activities like hunting and fishing. The theme of all his writing is personal honour and courage, but he tends to romanticise violence and suffering. His finest work is his earliest, the short stories *In Our Time*, 1924, and the novel *A Farewell to Arms*, 1929. Hemingway's last novel, *The Old Man and the Sea*, 1952, the story of an old man's struggle to catch and land an enormous fish, has immediate appeal, but on subsequent readings its language seems contrived and precious.

Doris Lessing (b. 1919).

A Rhodesian by birth, Doris Lessing emigrated to England in 1949. She is probably best known as a novelist, but has also published poems, short stories, and plays.

Her novels explore ways in which people are affected by belonging to minority groups. Her subjects include white Rhodesians and South Africans, members of extreme left-wing political parties, and women who resent the fact that ours is still largely a man's world. The objective sympathy which is so distinguishing a feature of her treatment of the first two subjects occasionally deserts her when she writes about the third.

***The Grass is Singing*. 1950.**

In this accomplished first novel, set in South Africa, Doris Lessing writes of the tortured lives of Dick and Mary Turner, isolated members of the White agricultural community, and of their relationships with their African servants.

The Children of Violence tetralogy—*Martha Quest*, 1952, *A Proper Marriage*, 1954, *A Ripple from the Storm*, 1958, *Landlocked*, 1965 (all Pa).

The first two books of this tetralogy constitute Doris Lessing's finest work to date. Reading them one is constantly reminded of George Eliot. Not only do both novelists employ similar techniques, but they share an intense concern with problems of morality and ethics.

Martha Quest, the novel's passionately idealistic heroine, recalls Dorothea Brooke and Maggie Tulliver, and is presented here with the same kind of objective, ironic sympathy that characterises George Eliot's treatment of Dorothea.

In the second half of the work, however, the portrayal of Martha is almost overwhelmed in a detailed study of the social and political life of Rhodesia during the Second World War.

Fascinating as social documents, from a literary viewpoint these volumes are less satisfying than the first half of the novel.

The Golden Notebook. 1962. P.

The content of this novel is most interesting but its form is awkward. The first part of each of its sections recounts incidents in the lives of the heroine, Anna, and her friends and acquaintances. The rest of the novel consists of extracts from notebooks, some diaries, some stories, in which Anna, a novelist, writes of her feelings about her work and her experiences as a disillusioned member of the Communist Party and as a divorcee who hopes to remarry.

Malcolm Lowry (1909–57).

Under the Volcano. 1947. P.

Readers of this complex novel, one of the century's finest, should see Lowry's own criticism of it in *Selected Letters*, edited: Breit & Lowry (Cape).

Set in Mexico in 1938 and '39, it relates the tragedy of the alcoholic Geoffrey Firmin and his wife, Yvonne, to the world tragedies of war and man's inhumanity to man.

In his neglected garden—a symbol both of his ruined marriage and of the mutilated world—Firmin stumbles on a broken notice-board. On it are the words:

> " Do you like this garden?
> Why is it yours?
> We evict those who destroy! "

words repeated at the end of the novel. They recall two of its central images: Eden, signifying the beauty man discovers in Nature and the beauty he creates in loving human relationships: Hell, signifying the agony he suffers and causes others when he rejects love. Lowry sees man as a splendid, noble creature who must struggle incessantly to control sado-masochistic impulses, which he can restrain only when he loves others and is able to accept their love. " Man cannot live without love," is the novel's main theme.

Firmin is a tragic hero in the tradition of Marlowe's Faustus, to whom the novel's imagery relates him. The objectivity of Lowry's portrayal of the tortured world of addiction is remarkable: Firmin always has our sympathy, rarely approval.

This book is not simply a good story, but a great poem, its themes expressed not only through the events of the narrative, the lives and feelings of the characters, but through vivid descriptions of Mexico and its people, through subtle, complex imagery.

Bernard Malamud (b. 1914).

Malamud's name is often coupled with that of his compatriot Bellow. They have a common Jewish heritage. Malamud's novels are similar in theme to those of Bellow, but his writing is less exuberant. Both men show a keen appreciation of natural beauty, rare in American novelists.

The Natural. 1952. P.

This follows the struggle of a " natural " baseball player to realise his championship potential. With such a limited theme it is essential that the hero be a convincing figure and Malamud fails to make him one.

The Assistant. 1957. P.

Here Malamud found a much more fruitful subject, the quiet tragedy of Morris Bober, an unsuccessful Jewish grocer and, of his Gentile assistant, Frank Alpine. For the sake of Bober and of the latter's daughter, Helen, Alpine, who has made many " false starts " in life, gives up what may well be his last hope of achieving material success. The novel is written with beautiful restraint and Chekhovian irony.

A New Life. 1961. FS.

Levin, a reformed drunkard, obtains an English post at a small state college, but eventually sacrifices his hard-won chance of an academic career for the sake of the woman he has loved.

The novel is set in the early 1950s, the period of McCarthyism. Malamud criticises the hysteria pervading American life at this time, exemplified in the academic and social atmosphere of Cascadia College, where Levin, a man of liberal principles, suffers from his colleagues' fears and prejudices.

A New Life is less concentrated than *The Assistant*. It contains elements of picaresque comedy and is at times very amusing, though occasionally its tone seems frivolous and inappropriate.

The Fixer. 1966.

Yakov Bok is, like Levin, a victim of hysterical feelings of national insecurity. A Jewish odd-job-man—a fixer—he leaves the Pale Settlement for Kiev, hoping to begin a new, more fruitful life, but is arrested on a trumped-up charge and endures three terrible years' imprisonment awaiting trial.

The inspiration of the novel was the case of Mendel Beiliss, a Kiev labourer arrested in 1911, and falsely charged with the ritual murder of a Christian child. Malamud says the novel is intended to stand " rather as a myth than an isolated case-study." But it lacks the compelling force of myth. Malamud is no Kafka.

Iris Murdoch (b. 1919).

A philosophy don, Iris Murdoch has gained popular success as a novelist. Most critics would however, agree that, in the latter role, she has belied her early promise.

She began, in *Under the Net*, 1955 (P) with an amusing existentialist fantasy that occasionally recalls the early Beckett. This was followed by *The Flight from the Enchanter*, 1956 (P), whose characters are all shadowy figures, none having the unifying force of Jake in *Under the Net*. In *The Sandcastle*, 1957 (P) and *The Bell*, 1958 (P), the author attempts symbolic novels in traditional form (cf. Forster's *Howard's End*, *A Passage to India*). In *The Bell* the symbolism is more fully integrated with the narrative than in *The Sandcastle*, and the characters more imaginatively conceived. This novel is regarded by many as Iris Murdoch's finest work, though a number of critics prefer her first.

At times in all her novels she attains a poetic intensity, as when Dora releases the butterfly (*The Bell*), Rainborough regards the snail (*The Flight from the Enchanter*), and in the evocation of bomb-scarred East London in freezing fog (*A Time of Angels*, 1966). The humanitarian theme of acceptance of responsibility for others, as well as for oneself, is central to her work.

Iris Murdoch's latest novel, *The Nice and The Good*, 1968, has had a mixed reception from critics.

V. S. Naipaul (b. 1932).

This distinguished Caribbean novelist was born in Trinidad of Indian parents. The heroes of all his novels are men who feel an urgent need to give their lives order and significance. Thus although most of his work has a Caribbean setting, its themes are of world-wide interest. Naipaul began as a writer of comedy and all his novels have a comic element although his work has become increasingly sombre in tone as it has increased in complexity.

The Mystic Masseur. 1957. P.

In this delightful comedy of Colonial politics, Naipaul shows the metamorphosis of Ganesh Ramsumair, an insignificant, semi-educated Indian, into G. Ramsey Muir, M.B.E., respected Colonial statesman.

A House for Mr. Biswas. 1961. Fo.

This sad story tells of Mr. Biswas's search for independence and security. Inveigled into early marriage, he finds he is expected to become a submissive appendage of his mother-in-law's enormous household. Biswas has no intention of playing this role, but he is not a practical man and has little formal education and no trade, so that his first two attempts to establish himself independently soon fail. At last, in his early forties, he manages to buy a house, but dies soon afterwards.

Naipaul makes us feel the dreadful tensions and frustrations of family life in overcrowded conditions where there is never any privacy, but despite its sad theme, the novel is often very funny, for Biswas is an imaginative man who delights in colourful language and has a flair for picturesque invective. His touching pride in his children's intelligence and his growing love and respect for his wife are most sensitively portrayed.

Mr. Stone and the Knights Companion. 1963. FS.

The elderly Mr. Stone is filled with despair at the prospect of his impending retirement. Then he suddenly conceives the idea that active pensioners of his firm should visit the disabled. Organising this scheme gives him new hope and vigour and although these fade the novel ends on a note of subdued confidence.

The Mimic Men. 1967.

Singh, the narrator of this fascinating novel, is an exiled politician from a newly independent Caribbean state. Singh analyses the events of his life, which he convincingly suggests is representative of those of all Colonial politicians. Thrust suddenly into power, they are compelled to destroy the former pattern of administration and, having no traditions to guide them, nor any experience of government, inevitably become "mimic-men."

Vladimir Nabokov (b. 1899).

A Russian by birth, Nabokov came to England during the Revolution, subsequently lived in Germany and France and emigrated to America in 1940.

Translations of his early novels are now becoming available. Those he has written in English include *Lolita*, 1955 (Co), *Pnin*, 1957, *Pale Fire*, 1962 (Co). The first of these gained notoriety among the ill-formed who imagined it was pornographic. Nothing could be further from the truth.

Nabokov is a learned writer. His humour, wit, and above all his masterly use of language, make his novels a constant source of delight.

Flannery O'Connor (1925–64).

The work of this novelist and short-story writer from the Southern States of America has a growing reputation in her own country, although it is less well known in England and has until very recently been difficult to obtain.

Flannery O'Connor published two novels, *Wise Blood*, 1952, and *The Violent Bear it Away*, 1960. She writes in a poetic, ruthlessly comic style about isolated eccentrics afflicted with religious mania, who evolve their own grotesque, fundamentalist creeds.

George Orwell (1903–50).

Orwell's post-war novels express feelings apparent in his earlier journalism.

Animal Farm. 1945. P.

The theme of this satirical fable is the futility of popular revolutions. Led by the pigs, the animals of Manor Farm evict their brutal owners. However, one of the pigs, Napoleon, gains absolute power, establishing a police state. The animals are worse off than before.

1984. 1949. P.

This grim nightmare, which Orwell wished to call *1948*—his publisher dissuaded him—develops the ideas of *Animal Farm* in a vision of a totalitarian world whose rulers exploit psychological and technological discoveries to retain and consolidate power.

As a novel it is less successful than *Animal Farm*. It has not the latter's occasional humour, and the presentation of its villain, O'Brien, is unconvincing. Raymond Williams's *Culture and Society* (P) sympathetically relates the novel to Orwell's paradoxical feelings about socialism.

Anthony Powell (b. 1905).

Powell published five novels in the 1930s. The elegance of his style and the fact that he took a comic view of upper- and middle-class society led to his comparison with Waugh.

His sixth work, *A Dance to the Music of Time*, is planned in twelve volumes; eight have appeared: *A Question of Upbringing*, 1951, *A Buyer's Market*, 1952, *The Acceptance World*, 1955, *At Lady Molly's*, 1957 (all Fon), *Casanova's Chinese Restaurant*, 1960, *The Kindly Ones*, 1962 (both P), *The Valley of Bones*, 1964, *The Soldier's Art*, 1966.

In this poetic novel Powell is clearly influenced by Proust. His narrator, Nicholas Jenkins, imagines the passage of time as a formal dance in which people appear and reappear unexpectedly and in surprising combinations. This is the novel's central image.

Jenkins, an extremely intelligent, thoughtful man, is a connoisseur of pictures and a novelist vividly aware of the limitations of our knowledge of others, even of our closest friends, and of the dangers of forming stereotyped ideas of people. He has an insatiable desire to understand what motivates human action, particularly how we are influenced by the thirst for power and by a love of adventure. Jenkin's gradual realisation of the complexity of life is expressed poetically through the references to paintings: as a young man he is usually drawn to Renaissance and Baroque works with classical subjects; as he becomes "less ascetic, intellectually speaking more corrupt perhaps," and recognises that "individuals live in different ways," that "all human beings . . . seen at close range are equally extraordinary," he refers increasingly to paintings of later periods.

The novel, which begins in the early 1920s, with a flashback to 1914, has now reached the middle of the Second World War, and contains an enormous range and variety of characters. Each volume introduces new figures.

Powell has the most sensitive ear for nuances of speech. His novel, leisurely, but never dull, contains passages of brilliant comedy.

Alan Sillitoe (b. 1928).

Sillitoe's first book, *Saturday Night and Sunday Morning*, 1958 (Pan) is among the better of a number of novels of working-class life which

appeared in the late 1950s and early '60s. Others include Keith Waterhouse's *There is a Happy Land*, 1957 (P), *Billy Liar*, 1959 (P), Barstow's *A Kind of Loving*, 1960 (P), and David Storey's *Flight into Camden*, 1960 (P).

Arthur Seaton, the hero of Sillitoe's novel, is a belligerent young worker in a Nottingham bicycle factory. He sees life as a continual battle for survival and feels particular hostility towards the forces of "the Establishment". Seaton's hero is Boris Karloff, but his deepest satisfaction comes from a quiet day's fishing and a country walk with his girl friend.

The novel is uneven in quality, but its occasionally cheap and sensational language appropriately suggests the influence of Seaton's favourite films, and much of the dialogue is vigorously realistic. The rural scenes reflect the influence of Lawrence, who also came from Nottinghamshire.

Saturday Night and Sunday Morning was followed in 1959 by a volume of stories containing a fine nouvelle, *The Loneliness of the Long-Distance Runner*, which gives the book its title. Sillitoe's later novels, which have been generally less favourably received by critics, include *The General*, 1960 (Pan), *The Death of William Posters* (1965) and *A Tree on Fire* (1967). The two latter are the first volumes of a projected trilogy.

C. P. Snow (b. 1905).

Strangers and Brothers—9 vols. 1940–64. P.

In the course of this sequence the narrator, Lewis Eliot, rises from humble beginnings to success at the Bar, at Cambridge, and in the Administrative Civil Service. While this is clearly not an autobiographical work, the course of Snow's own career as a scientist, don, and civil servant has followed a similar pattern.

One of the strengths of these volumes derives from the fact that Eliot is an unprejudiced observer of his friends' and colleagues' behaviour. We feel he prefers some men to others, but rarely does he judge any of them.

The volumes follow no strict chronology and only two, *A Time of Hope* and *Homecomings*, are concerned directly with Eliot's personal life. In the second of these Snow movingly suggests the private agony that may underlie the life of a public figure. The other books of the sequence are each centred on the life of one of Eliot's friends or acquaintances. The best of them all is *The Masters*, where an account of the election of the Master of a Cambridge college becomes an image of political life. The other volumes have a less perfect form and vary in quality, but all are of documentary interest in that they deal with such subjects as the making of the first atomic bomb and the painful decisions in which scientists and civil servants were involved at that time.

Muriel Spark (b. 1918).

Mrs. Spark is a prolific writer who has published a play, poems, short stories and eight novels (the last all P). Professor Kermode has suggested that her last three novels, *The Prime of Miss Jean Brodie*, 1961, *The Girls of Slender Means*, 1963, and *The Mandelbaum Gate*, 1965, "add up to the most distinguished achievement of any British novelist since the war." However, although Mrs. Spark's novels are popular, many people find it difficult to take them seriously. The reasons for this seem to lie in her treatment of character, in the discrepancy one feels between her skilled portrayal of some aspects of character and her apparent inability to portray others, rather than the fact that many of her works are a strange mixture of comedy of manners and surrealist fantasy.

Mrs. Spark writes most convincingly of absurd and grotesque behaviour, as is shown by her account of the elderly Godfrey's stealing a cake (*Memento Mori*, 1959), and of the fake séance in *The Bachelors*, 1960. She has an accurate ear for comic and grotesque language (*e.g.* the schoolgirls' discussion of sex (*The Prime of Miss Jean Brodie*), the conversation of the old women in hospital (*Memento Mori*), and Jimmie's delightful English, learnt from studying Shakespeare, the Metaphysical poets and Fowler's *Modern English Usage* (*Robinson*, 1958)).

However, Mrs. Spark portrays other aspects of human behaviour unconvincingly and seems unable to treat a character in depth, or at any length, as is clear from her latest novel, *The Mandelbaum Gate*. She comes nearest to doing so in *Memento Mori*, particularly in her presentation of Jean Taylor, and this novel, in which a group of old and elderly people receive mysterious telephone calls saying, "Remember you must die," remains Mrs. Spark's most satisfying work.

The Mandelbaum Gate, her first full-length novel, is set in divided Jerusalem and contains an account of a day in the Eichmann trial. Its plot is extremely melodramatic, but this would not matter if the heroine were convincingly presented. Forster's *A Passage to India* has a melodramatic plot which in no way detracts from the novel's excellence.

Perhaps, as Kermode suggests, many of us have yet to accustom ourselves to Mrs. Spark's techniques. Meanwhile she is likely to be enjoyed for her wit and for the tart economy of her language.

Evelyn Waugh (1902–66).

Waugh's style is elegant and his novels are often amusing, but they are generally superficial and marred by cruelty and distasteful snobbery. A popular writer of the 1930s, he has published nine novels since the War.

The Sword of Honour trilogy (pub. in 3 vols. 1952–62, revised and reissued as one book 1965).

Waugh's best novel, this chronicles the experiences of Guy Crouchback during the Second World War. Crouchback welcomes the War, which he feels will give his life the direction and purpose it has lacked since his wife deserted him. The first two volumes of the trilogy give a convincing impression of administrative incompetence during the early stages of the War and are occasionally very funny, but they share the cruelty and snobbery of Waugh's other writing.

The third volume is much better. Crouchback, a cardboard figure until now, comes alive and, in a moving encounter with a refugee woman, is forced to admit he became a soldier in order to evade the difficulties of his personal life, and that he, and others like him, were as responsible as the "enemy" for the horrors of the War. On his return to London, on leave, Crouchback tries to resume his civilian responsibilities and remarries his former wife, whom he knows is pregnant by another man. Sometime after her death in an air-raid, he marries again and settles down to a happy family life, much to the chagrin of his sister's husband, Box-Bender, who had expected his wife would become Crouchback's heiress. This trite conclusion spoils an otherwise effective volume.

Patrick White (b. 1912).

White, an Australian, was educated in England, where he took a degree in Modern Languages, and has travelled widely in Europe and America. Five of his seven novels have appeared since the War: *The Aunt's Story*, 1948, *The Tree of Man*, 1955, *Voss*, 1957, *Riders in the Chariot*, 1961 (all P), *The Solid Mandala*, 1966. He has also published plays and short stories.

Like Golding's, White's novels are, essentially religious poems, but whereas Golding, except in *The Spire*, concentrates on man's loss of grace, White is more concerned with his experience of an awareness of "the God above God," who is both immanent and mysteriously transcendent, and with man's struggle towards some understanding

of the purpose of life, and of the nature of good and evil.

White's vision of life, as reflected in these novels, is similar to that of the existentialist theologian Tillich (see his *The Courage to Be*, Fo). He suggests that the "conformism" of "civilised" life is inimical to goodness, and exemplifies this in his treatment of the suburb Sarsaparilla, the setting of *The Solid Mandala*, and of parts of all the other novels (though it does not acquire the name until *Riders in the Chariot*). The everyday life of Sarsaparilla is presented variously, as comic, sterile, hypocritical, cruel, and evil. It is almost always hideous and invariably pitiful. White's creation of Sarsaparilla, which is also the setting of one of his plays and of several stories, invites comparison with Faulkner's creation of Yoknapatawpha County.

In each of the three middle novels, White creates a wide range of characters. In *The Aunt's Story* and *The Solid Mandala* he limits himself to a few. All his main characters are regarded by most of their acquaintances as odd, or stupid, or mad. They are generally avoided, and often feared and attacked, because their essential innocence presents an intolerable challenge to the self-protective conformism of "normal" people. Notable exceptions are the tragic Nietzschian "superman," Voss, and Waldo, one of the main characters of *The Solid Mandala*. Both are isolated by their own colossal arrogance. All White's heroes and heroines suffer greatly, and some die, but, except in *Voss*, he does not imply that suffering is a necessary condition of goodness, but rather that it is its inevitable concomitant. Joy returns to those who survive, for, all these novels emphasise, though good must endure evil, it never yields to it.

Another of the novels' recurrent themes is the difficulty of communication. Even the most educated of White's characters find it almost impossible to articulate their experiences of joy and suffering. Many of them try to express themselves in other ways, in painting, music, dance, and increasingly, through a selfless love for others.

Like that of all major writers, White's style is highly individual and makes challenging demands upon his readers. His idiosyncratic punctuation and, in *The Tree of Man*, his frequent use of "verbless sentences," seem attempts to reflect his characters' fumbling for understanding and expression of their experiences. Sometimes White makes no obvious distinction between his characters' expression of feeling and his own comment upon that expression. In *The Aunt's Story*, such interplay between his own and his character's viewpoint is at times confusing, but in subsequent novels his increasing mastery of technique adds to the subtle, allusive qualities of his style. White takes a poet's delight in the metaphorical ambiguity of words. He is a master of ironic bathos and epigrammatic wit.

His work is by no means faultless. Occasionally the style of *The Tree of Man* seems self-conscious, the symbolism clumsy. Passages of *Riders in the Chariot* are empty rhetoric, and in this novel we never discover, as we need to, how far, if at all, Miss Hare is responsible for her father's death. In *Voss*, when he describes Laura's feelings during Rose's terrible confinement, White does not seem in full control of his material.

Despite faults like these, White remains one of the most rewarding, if also one of the most demanding, of contemporary novelists. Each of these five works is extremely complex. To write of them so briefly is to deal summary justice. They are often highly comic, and all express a joy and wonder in the glory of Creation that recall the magnificent sections 29–38 of the first of Thomas Traherne's (d. 1674) *Centuries of Meditation*.

Angus Wilson (b. 1913).

Although now best known as a novelist, Wilson first made his name with a volume of short stories, *The Wrong Set*, 1949 (P). He has since published two other collections of stories and a play, as well as six novels.

He is an admirer of Jane Austen, whom his style occasionally recalls, and of the great nineteenth-century French and English novelists. Like theirs, his work reads aloud extraordinarily well.

A serious comic novelist, Wilson is merciless in exposing snobbery, hypocrisy, and self-deception. However, he does not always achieve artistic transformation of his material. Thus, although some of the finest parts of his work are in dialogue, some of his virtual conversations are as painful to read as they would be to endure in reality. Horrified, yet fascinated by cruelty and vulgarity, Wilson has been called "morbid" by some critics. There are certainly times, especially in *The Old Men at the Zoo* and *No Laughing Matter* when the charge seems justified. But Wilson can also be deliciously funny, as in his account of the Historical Association meeting (*Anglo-Saxon Attitudes*).

His chief technical fault is a tendency to overload his novels with characters he has no time to develop. His best works seem to be *The Middle Age of Mrs. Eliot* and *Late Call*; in both his cast is limited. Some of the minor characters, particularly working-class ones, appear caricatures, and variations of the same types recur from one book to another Wilson is, nevertheless, a writer of immense vitality. Each of his novels is quite unlike the others, although they have certain common themes.

Obviously aware of the stresses imposed by the political and social problems of our century, Wilson was the first contemporary English novelist to write frankly of the homosexual "underworld."

Hemlock and After, 1953 (P), *Anglo-Saxon Attitudes*, 1956 (P), *The Middle Age of Mrs. Eliot*, 1958 (P), *Late Call*, 1964.

Each of these novels opens with the hero or heroine facing a crisis which compels him (her) to reassess his (her) adequacy as a person and in relation to others. Each endures considerable mental suffering. Bernard Sands, the novelist hero of the first book, dies before he can rebuild his life. Geoffrey Middleton, historian, connoisseur of pictures (*Anglo-Saxon Attitudes*), Meg Eliot, widow of a successful barrister, and Sylvia Calvert, retired hotel manageress (*Late Call*), each, in quite different ways, comes to find purpose and meaning in life.

Conversely, Meg's brother, David, who has also suffered bereavement, withdraws to the "petty isolation" of his market garden. David is the most fully drawn of the several figures in Wilson's novels who indulge in ritual self-denial, instead of facing facts (cf. Inge, *Anglo-Saxon Attitudes*; Susan, *No Laughing Matter*).

The Old Men at the Zoo. 1961. P.

A political satire, the novel abounds in images of brutality and sadism. At the beginning of the book, the narrator, Simon Carter, Administrator of the London Zoo, seems more imaginative and sensitive than his colleagues, but he becomes increasingly cold-blooded. The novel is an exploration of megalomania. Each of the Zoo's successive Directors is obsessed with putting his own pet schemes into practice and ruthlessly exploits his colleagues and the animals in his care, all of whom he regards as objects to be manipulated. The book closes, at the end of a British–European war, with Simon's canvassing his own appointment to the Directorship.

No Laughing Matter. 1967.

This ambitious, extremely long novel, written in a variety of styles and containing a short story and several plays, presents a panorama of twentieth-century life. Ultimately, it seems to fail, because, since the narrative is divided among the lives of the six Matthews children and their parents, constantly shifting from one to another, none of the characters is fully realised.

II. ENGLISH VERSE

This section is concerned with English verse since the time of Chaucer, with its different metres and rhymes. The poets' subtle verse patterns of metre and rhyme are indeed one of his most potent means of expression, and by keeping an attentive ear to them we are helped to catch his meaning.

A glance at any good anthology of English poems written during the last five or six centuries will show what a rich variety of traditional verse patterns the contemporary poet now has at his disposal, whatever may be his mood or theme. Our poet laureate, Masefield, has made great use of these time-honoured forms. For his leisurely "Dauber," he employs the stately "rhyme-royal" stanza that was no longer new even to Chaucer. His sonnets are of Shakespearean design, and for his brisk "Reynard the Fox" he uses the octosyllabic couplet in which the Puritan poet, Marvell, once hymned the newly discovered "remote Bermudas."

Many poets, however, find the traditional forms are not sufficiently flexible for modern needs, and they may so drastically modify them as to make them, at first sight, unrecognisable.

One of the most indefatigable experimenters has been Dame Edith Sitwell. In the notes to the Penguin selection of her poetry she says:

> "At the time I began to write, a change in the direction, imagery, and rhythms in poetry had become necessary, owing to the rhythmical flaccidity, the verbal deadness, the dead and expected patterns, of some of the poetry immediately preceding us.
>
> "Rhythm is one of the principal translators between dream and reality. Rhythm might be described as, to the world of sound, what light is to the world of sight. It shapes and gives new meaning."

Placing so high a value on rhythm, Edith Sitwell set herself, in her early "Facade," to tireless experiment in the effect on rhythm or metre of all kinds of subtle devices in the use of sound, until, as she says, her experiences led to the poem "Gold Coast Customs." This poem, written in 1929, is "about the state that led up to the second World War," and is prophetic in its vision of

"That sick thick smoke from London burning."

When we first read "Gold Coast Customs" we are shocked and stunned by this portrayal of the ruthless and heartless savagery of our so-called civilization. The shock is driven home by the metre, a savage staccato of stabbing lines, that echoes the fevered heart-beat of those indifferent to poverty and suffering, of the "rich man Judas, brother Cain." It also echoes "the beating of the drums that heralded the Customs, as they were called, in Ashantee, a hundred years ago, when, at the death of any rich or important person, slaves and poor persons were killed so that the bones of the dead might be washed by human blood."

Only when we recover from our shock and look carefully at the verse, do we realise that this blood-curdling metre, apparently entirely new, is written according to age-long principles, and uses for the most part an irregular tattoo of the iambs and anapæsts that are the ground beat of most of our finest verse.

As Day Lewis has said in the Preface to the Penguin selection of his poems:

> "We must never think of 'modern poetry' as something in a vacuum, or something that started in 1900 or 1917 or 1930. Every good poem has grown out of the compost of all the poetry ever written."

Of his own poems Day Lewis goes on to say, "Contrary to received opinion about modern verse, nearly all my poems 'rhyme and scan,'" and the same may be said of most of our highly original contemporary poetry, such as that of W. H. Auden or Dylan Thomas.

The poet's intensely individual music is played on the age-old instrument of metre and rhyme, and the better we understand the instrument, the keener will be our enjoyment of the poet's skill and genius.

Even verse that cannot be called poetry—verse that is mechanical, uninspired, lacking that intensity of insight and expression that we recognise as poetic—even this mediocre verse can teach us something of the poet's instrument. A homely nursery rhyme like "Humpty Dumpty" can help us to appreciate the metre of Ariel's unearthly song, "Where the bee sucks."

It is for this reason that the following guide to versification throws its net wide, gathering together for our consideration patterns as diverse as those of the mediæval ballad and the modern Frenchified triolet, of the flippant clerihew, and the grave blank verse of Wordsworth's "Prelude."

Reference

The following account of our verse is illustrated by quotations and by constant reference to the numbered poems in the new edition of "The Oxford Book of English Verse," 1939.

Thus "OBEV 16" means "Oxford Book of English Verse," New Edition, Poem No. 16.

I. INTRODUCTION. STRESS, METRE, AND RHYME.

If we listen carefully to spoken English, we shall observe that there is a natural tendency to stress some syllables more than others. In the following sentence, for example, the greater stress normally falls on the syllables whose vowels are marked with an acute accent, which is the usual way of indicating stress.

"The expréss léft Mánchester at séven."

It is obvious that in this sentence the stress falls in a quite haphazard way, and it is for this reason that we recognise the sentence as prose, for the essential difference between English prose and verse is that in prose the stress falls at random, while in verse the stressed syllables occur according to some regular pattern.

If we mark the stressed syllables in the following line from Wordsworth,

"And lóud hallóos and scréams and échoes lóud,"

it is immediately clear that the stress occurs regularly. The line is in fact, composed of a simple stress pattern of an unstressed syllable followed by a stressed (*e.g.*, and lóud) which is repeated throughout.

It is a regular pattern of stress, such as this, that in English verse constitutes what we call "metre." Metre in Greek means simply "measure," and it is always by stress that we measure our verse.

Another feature that distinguishes our verse from prose is the use of rhyme, although rhyme, unlike metre, is not essential to verse.

II. METRE.

Different Kinds of Feet.

In English verse the unit of stress pattern constitutes a foot, the foot of verse being comparable to the bar of music.

English verse uses several kinds of feet, some of two syllables, or disyllabic, some of three syllables or trisyllabic, and occasionally a foot of four syllables.

Disyllabic feet are of four kinds:

The Iamb, consisting of an unstressed syllable followed by a stressed, *e.g.* " retúrn."

The Trochee, consisting of a stressed syllable followed by an unstressed, *e.g.*, " river."

The Spondee, consisting of two stressed syllables, *e.g.*, " dóor mát."

The Pyrrhic, consisting of two unstressed syllables, *e.g.*, in the phrase " into tówn," " into " is a pyrrhic.

Trisyllabic feet are of four kinds:

The Anapæst, consisting of two unstressed syllables followed by a stressed, *e.g.*, " as you wish."

The Dactyl, consisting of a stressed syllable followed by two unstressed, *e.g.*, " árchery."

The Amphibrach, very rarely used, consisting of a stressed syllable between two unstressed, *e.g.*, " delighted."

The Tribrach, still more rare, consisting of three unstressed syllables, *e.g.*, last three syllables of " incommúnicable."

A four-syllabled foot is very occasionally found:

The Choriambus, which may be thought of as a trochee followed by an iamb, *e.g.*, " Tóll for the bráve."

Different Kinds of Metrical Line.

Based on the different kinds of feet are the different kinds of English metre, which may be compared with the " time " in music.

Disyllabic metres may be either iambic or trochaic, for it is impossible to speak at any length using only pyrrhic or spondees, and the most common trisyllabic metres are anapæstic or dactyllic. Examples of different kinds of metrical line follow.

Iambic Line.

" I stróve with nóne for nóne was wórth my strife."
[OBEV 584]

Trochaic Line.

" Hóme art góne and tá'en thy wáges."
[OBEV 150]

Anapæstic Line.

" With a héy and a hó and a héy noninó."
[OBEV 147]

Dactylic Lines.

" Wit with his wántonness,
Tásteth death's bitterness."
[OBEV 177]

Amphibrach Lines.

" Most friendship is feigning, most lóving mere fólly
Then héigh ho, the hólly!
This life is most jólly."
[OBEV 146]

Choriambic Line.

" Kéntish Sir Býng stóod for his King."

Variations in Metre.

Satisfying poetry is rarely entirely regular. Mechanical regularity is soon wearisome to the ear and is a characteristic of doggerel. The poet satisfies our love of rhythm in a more interesting and subtle way by introducing all kinds of variations and inversions, while at the same time maintaining the throb of the basic metre. An account of the chief variations follows.

Elision.

Elision is the suppression in pronunciation of a vowel or a syllable.
In the anapæstic line,

" The Assýrian came dówn like a wólf on the fóld "

the second foot appears to have four syllables, but in fact the " i " of " Assýrian " is elided or dropped before the " a " as shown by the little bracket. The elision of " i," which is pronounced " y " and known as " consonantal y," is especially common, and occurs in such words as " familiar," " opinion." Elision is often shown by the use of the apostrophe as in " heav'n." In " heav'n " we see one of the many conventional elisions of poetry, like " 'tis," " 'twas," " did'st," " o'er," " e'er," " 'gainst," and many more.

Substitution.

Substitution is the use of a foot different from that of the metre in which the poem is written. In the following examples we can see the effect on iambic verse of some common substitutions.

Of a Trochee.

" Stiffen the sinews, súmmon úp the blóod."
Shakespeare, " Henry V."

Here the initial trochee gives force and emphasis.

Of a Spondee.

" Rócks cáves, lákes féns, bógs déns and shádes of déath."

In this extraordinary line of Milton's the spondees slow down and weight the verse.

Of a Pyrrhic.

" They flý forgótten as a dréam "

Here the pyrrhic in the third foot gives lightness to the line.

Of a Dactyl.

" Cháttering his téeth for cóld that did him chill."

When a dactyl replaces an iamb it is usually in the first foot as in this typical instance from Spenser, where the dactyl gives emphasis and variety to the line.

Of Anapæsts.

" And the cóming wind did róar more lóud
And the sáils did sigh like sédge."
[OBEV 562]

The initial anapæsts in these two lines from " The Ancient Mariner " give an effect of hurry and speed.

Additional Syllable.

An additional syllable may be added to either the beginning or end of a line.

Feminine Ending.

A feminine ending is an extra unstressed syllable that is added after the final stressed syllable of a line, giving a gentle falling inflexion. It is often used in blank verse and is a marked characteristic of Shakespeare's later plays, *e.g.*,

"Be not afear'd; the isle is full of noises,
Sounds and sweet airs that give delight and hurt not."

Anacrusis.

Anacrusis is the use of an extra syllable before the first regular foot of the line.

Dropped Syllable.

It sometimes appears that a line is a syllable, or syllables, short, until we realise that a suspense or pause occupies the time that would have been taken by the missing syllable. The dropped syllable can be indicated by the "caret" mark, thus ^. The following technical terms are used for lines that are short of syllables.

Catalectic Line.

This leaves off in the middle of the last foot, as in the trochaic line

"Ẽver lét the fáncy róam,"

or the dactylic line,

"Rings on her fingers and béłls on her tóes."

The catalectic line is common in trochaic and dactylic verse, for it is in keeping with the tendency of English verse to end on a stressed syllable.

Acephalous Line.

This omits the first syllable of the line, as in the anapæstic line,

"That hóst with their bánners at súnset were séen."

The Cæsura.

The cæsura is a special kind of pause, quite different from that which indicates a dropped syllable. It is a pause about the middle of a line and is usually indicated by a pause in the sense, *e.g.*,

"Both hungered after death; both chose to win or die."

Two Ways of Describing Metre.

The Classical.

The actual names that we have been using for the different kinds of feet and metres are derived from Greek. It is most important, however, to realise that in the classical languages they had a different meaning, for Greek and Latin verse was written on a quite different principle from ours, and was scanned according to the "quantity" or length of the syllable, and not according to stress. Thus an iamb in Greek and Latin consisted of a short syllable followed by a long, marked thus, ◡ –, and a trochee of a long syllable followed by a short, marked – ◡.

In English verse the length of the syllable is totally irrelevant. For instance, the line,

"Pólly pút the kéttle ón and léts have téa"

begins with five trochees, all consisting of two *short* syllables.

The application of Greek words to English metres is confusing only if we forget that in English verse the criterion is stress.

The Modern.

Some writers, however, prefer new ways of describing our verse, and the most popular method is set out below:

A foot is called a period.
A disyllabic metre is called duple or double time.
A trisyllabic metre is called triple time.
A period with the stress on the first syllable is said to be falling.
A period with the stress on a second or third syllable is said to be rising.

III. RHYME.

Another thing that gives a formal pattern to English verse, and distinguishes it from prose, is rhyme. It is not essential to our verse, much of our verse being rhymeless.

Rhyme is a similarity in sound in words occurring normally at the ends of lines. In true rhyme the last stressed syllable and consonants following it are the same, while the sounds preceding the stressed vowel are different, *e.g.*, "cage/page," "pleasure/treasure."

The Types of Rhyme.

The most familiar division of rhyme is into masculine, feminine, and triple rhyme, but we also distinguish broken and Leonine rhyme.

Masculine, Male, or Single Rhyme.

The final syllable is stressed, *e.g.*, "cage/page," "joy/boy."

Feminine, Female, or Two-syllabled Rhyme.

The syllable before the last is stressed, and the final syllable unstressed, *e.g.*, "pleasure/treasure," "bending/lending."

Triple or Tumbling or Three-syllabled Rhyme.

The antepenultimate syllable is stressed. Triple rhyme is normally found in light or comic verse, like that of W. S. Gilbert. This punning "Epitaph on a Dentist" employs it:

"Stranger! Approach this spot with gravity!
John Brown is filling his last cavity."

In "The Bridge of Sighs" [OBEV 662] Hood dares to use it in a serious poem with such rhymes as "scrútiny/mútiny."

Broken Rhyme.

Broken rhyme, where more than one word is needed to complete the rhyme, is occasionally used, *e.g.*, "estate/their gate."

Leonine Rhyme.

Although rhyme normally occurs at the end of the line, we also find verse where the first half of the line rhymes with the second. This device, known as Leonine rhyme, is frequently used in Coleridge's "Ancient Mariner" [OBEV 562], *e.g.*,

"The ice did split, with a thunder-fit."

Poetic Licence in Rhyme.

The difficulty of rhyming in English is considerable, for many words have not a single rhyming word, some have only one, others very few. Certain licences are therefore allowed to the poet in the following ways:

Eye Rhyme or Printers' Rhyme.

Here words rhyme only to the eye, as "love/move." Keats in "Meg Merrilies" uses "rushes/bushes."

Identical Rhyme.

Here the same syllable or word is used twice so that the line rhymes with itself, *e.g.*, "part/impart" [OBEV 562], "universe/this verse" [OBEV 617]. The use of rhyming words spelt differently but pronounced identically is also a poetic licence, *e.g.*, "wright, write, right."

Cockney Rhyme.

Keats' use of Cockney rhymes has been much criticised, *e.g.*, "mourn/torn," "faces/vases," "briar/attire." There is still considerable difference between Northern and Southern pronunciation of English, and many eminent poets have availed themselves of a Southern pronunciation in rhyming "dawn/morn," although in the North of England the "r" of "morn" would be sounded.

Assonance.

Assonance is sometimes used instead of rhyme, and occurs frequently in early folk poetry and less formal verse. It consists in a similarity in the accented vowels and those which follow, but not in the consonants, *e.g.*, "feet/creep," "skin/swim."

Perversion of Rhyme.

Modern poets, following Wilfrid Owen, have sometimes used a deliberate perversion of rhyme, which should not be confused with assonance. Wilfrid Owen opens his bitter poem "A Terre" with the following stanza:

"Sit on the bed. I'm blind and three parts shell.
Be careful; can't shake hands now; never shall.
Both arms have mutinied against me,—brutes.
My fingers fidget like ten idle brats."

The deliberate falsity of rhymes like "shall/shell," and "brutes/brats" conveys Owen's horror at the disintegration and collapse of the First World War.

Recording of Rhyme Schemes.

The conventional way of noting rhyme schemes is to call the first series *a*, the second *b*, and so on. Normally each new series is indented, *e.g.*,

"Joyful, joyful!	*a*
When virginity	*b*
Seeks all coyful	*a*
Man's affinity.	*b*
Fate all flowery,	*c*
Bright and bowery	*c*
Is her dowery!	*c*
Joyful, joyful."	*a*

W. S. Gilbert, "Yeomen of the Guard."

IV. THE STANZA.

Some poems are divided into groups of lines, which strictly speaking are called "stanzas," though in popular language they are often known as "verses." Generally the stanzas of a poem are uniform, but sometimes they are varied as in Milton's "Lycidas" [OBEV 325].

V. ENGLISH VERSE FORMS.

English poetry uses an immense wealth of verse forms, distinguishable from each other by the predominating metre and also by the pattern of rhyme and the kind of stanza—or by the absence of rhyme and stanza. An account of these follows.

Iambic Metres.

The metre most natural to the English language is undoubtedly the iambic.

With Iambic Pentameter as Basis.

The iambic pentameter of five stresses and ten syllables, also called the iambic decasyllabic line, is more used than any other, and is the basis of the following forms.

Blank Verse. Blank verse, consisting of unrhymed iambic pentameters, is the metre of Shakespeare's plays, Milton's "Paradise Lost," Wordsworth's "Prelude," and Tennyson's "Idylls of the King." In the hands of such masters it is a most flexible instrument, especially when diversified with the eleven-syllabled line with a feminine ending. Shakespeare used the metre with increasing freedom, though it must be remembered that some apparent variations are due to the different pronunciation of Elizabethan times.

The following lines of blank verse occur in Wordsworth's "Prelude," Book III. He is describing his rooms in St. John's College, Cambridge.

'And from my pillow, looking forth by light
Of moon or favouring stars, I could behold
The antechapel where the statue stood
Of Newton with his prism and silent face,
The marble index of a mind for ever
Voyaging through strange seas of Thought, alone."

Heroic Couplet. The heroic couplet, consisting of iambic pentameters rhyming in pairs, was in Elizabethan times called "riding rhyme," possibly because it is the metre of The Prologue of Chaucer's "Canterbury Tales," and of many of the tales themselves. It became the most fashionable metre of the eighteenth century when it was used by Pope, Goldsmith, and Johnson. Keats later employed it in "Lamia."

The *Closed Couplet* was, in the heyday of the couplet's vogue, considered the most polished and correct. Here the sentence form exactly coincides with the couplet and the rhyme has a clinching effect, *e.g.*,

"True ease in writing comes from art, not chance,
As they move easiest who have learned to dance."

Pope was the supreme master of the closed couplet, and eschewed variations such as enjambement, or the Alexandrine.

Enjambement is a variation used by poets before Pope's time and revived by the Romantic poets. In enjambement the sentence flows over from one line or couplet to the next, and the click of the rhyme is submerged, *e.g.*, Keats' description of Lamia in her serpent form with skin of "dazzling hue."

"And full of silver moons, that, as she breathed,
Dissolv'd or brighter shone, or interwreathed
Their lustres with the gloomier tapestries."
Keats, "Lamia."

The Alexandrine, another variation, is a line of six iambic feet. Dryden made frequent use of the Alexandrine but Pope parodied it in the brilliant line that serves as a mnemonic.

"A needless Alexandrine ends the song,
That, like a wounded snake, drags its slow length along."

The triplet, another variation, consists of three lines rhyming together. The third line is frequently an Alexandrine.

Rhyme Royal. Rhyme royal has seven iambic pentameters, rhyming ABABBCC. Used by Chaucer in "Troilus and Cressida" [OBEV 14 and 15] and Shakespeare in "Lucrece," it was revived by Masefield in such poems as "Dauber."

Spenserian Stanza. The Spenserian stanza has eight iambic pentameters followed by an Alexandrine, rhyming ABABBCBCC. Invented by Spenser in "The Faerie Queene," it was used by Byron in "Childe Harold," Keats in "The Eve of St. Agnes," and Shelley in "Adonais."

Elegaic Stanza. The Elegaic stanza has four iambic pentameters, rhyming ABAB. It is also called the "heroic quatrain," quatrain meaning a four-lined stanza. This form is best known through Gray's "Elegy" [OBEV 465].

"Omar Khayyám" Stanza.

The "Omar Khayyám" stanza receives its name from its use by Fitzgerald in his translation of the "Rubaiyat." It has four iambic pentameters, rhyming AABA.

Ottava Rima. Ottava rima, also called the octave stanza, has eight iambic pentameters, rhyming ABABABCC. It was used by Byron in "Don Juan," and by Keats in "Isabella."

Terza Rima. Terza rima has stanzas of three iambic pentameters with a linking rhyme scheme: ABA, BCB, CDC, etc. The concluding stanza is rounded of with an extra line rhyming with its central line, *e.g.*, DEDE, constituting, in effect, a heroic quatrain. Used by Dante, the verse has been adapted by English poets. Shelley's "Ode to the West Wind" [OBEV 617] uses modified terza rima, the final rhymes being DEDEE.

The Sonnet. A sonnet has fourteen iambic pentameters. Perfected in Italy by Petrarch, who died in 1374, it was introduced into England in the sixteenth century. There are two chief types of sonnet.

The Petrarchan, or Italian, sonnet has an "octave" of eight lines, rhyming ABBAABBA, followed by a "sestet" of six lines, where some variety of rhyme schemes is found. The strictest Petrarchan sonnets have either two "tercets" of three lines each, with rhymes CDECDE, or else three pairs of lines rhyming CDCDCD.

An example of sestet rhyming CDECDE is Milton's "On His Blindness" [OBEV 327].

Examples of sestets CDCDCD are Wordsworth's "Upon Westminster Bridge" [OBEV 534] and Keats' "On First Looking into Chapman's Homer" [OBEV 641].

Not all of these examples observe the natural pause between octave and sestet which is characteristic of the strict Italian form, and many of our finest sonnets depart from the original rhyme scheme in both octave and sestet.

A lesser-known Petrarchan sonnet by Keats:

'To one, who has been long in city pent,
'Tis very sweet to look into the fair
And open face of heaven,—to breathe a prayer
Full in the smile of the blue firmament.
Who is more happy, when, with heart's content,
Fatigued he sinks into some pleasant lair
Of wavy grass, and reads a debonair
And gentle tale of love and languishment?
Returning home at evening with an ear
Catching the notes of Philomel,—an eye
Watching the sailing cloudlet's bright career,
He mourns that day so soon has glided by:
E'en like the passage of an angel's tear
That falls through the clear ether silently."

The *Elizabethan, or Shakespearean,* sonnet consists of three quatrains with the rhymes ABAB/CDCD/EFEF/ concluded by a couplet rhyming GG. The couplet often clinches the thought.

Examples are Shakespeare's sonnets [OBEV 155–174], and Keats' last sonnet [OBEV 644].

Other Iambic Metres.

Many of our iambic verse forms use a shorter or longer line than the pentameter.

The Octosyllabic Couplet. The octosyllabic couplet consists of lines of four stresses and eight syllables, and the lines rhyme in pairs. English poets like Marvell have used this metre effectively, *e.g.*, "A Garden" [OBEV 365, *see also* OBEV 367, 370]. It is the metre of Masefield's "Everlasting Mercy" and "Reynard the Fox."

The Ballad. There are two chief kinds of ballad metre.

(a) *Strict Ballad Form* consists of stanzas of four iambic lines, the first and third with four stresses, and the second and fourth with three, with the rhyme scheme ABCB. The fine old ballads "Sir Patrick Spens" [OBEV 381] and "The Wife of Usher's Well" [OBEV 388] are in this metre. Coleridge, in "The Ancient Mariner" [OBEV 562] shows how many varieties of stanza can be based on the simple ballad stanza.

"*Fourteeners*" is the name given to a form which is simply a re-arrangement of the ballad quatrain as a rhyming couplet of two iambic lines with seven stresses, as in Macaulay's "The Armada."

(b) *Less Strict Ballad Form, or Long Metre,* consists of stanzas of four iambic lines each with four stresses, the rhyme scheme being ABCB or ABAB. Many ancient ballads, such as "Thomas the Rhymer" [OBEV 379], are of this type.

"In Memoriam" Metre. This, the metre of Tennyson's "In Memoriam," is like the less strict ballad metre in having four iambic lines, each with four stresses, but its rhyme scheme is ABBA.

Short Metre. Short metre, rarely used, consists of iambic quatrains, each line having three stresses and the rhyme scheme being ABCB.

English Hymn Metres. Most English hymns are written in short iambic lines, and English hymnology names them according to the number of syllables. The most common are:

Common Metre, or 8686, with rhymes ABAB, *e.g.*, "O for a thousand tongues to sing" ["Songs of Praise" 595].

Long Metre, or 8888, with rhymes ABAB, *e.g.*, "When I survey the wondrous cross" ["Songs of Praise" 133].

Short Metre, or 6686, with rhymes ABCB, *e.g.*, "Blest are the pure in heart" ["Songs of Praise" 455].

Double Iambic Metre. When we are accustomed to hearing verse we come to realise that stresses are not always of equal weight. It is possible to distinguish in these "fourteeners" of Masefield a major stress, marked ″ and a minor stress marked ′.

"Oh sŏme are fónd of Spănish wine, and sŏme are fónd of Frĕnch,
And sŏme'll swállow tăy and stúff fit ŏnly fór a wĕnch."

Masefield's "Captain Stratton's Fancy" [OBEV 939]

The lines have in fact four major stresses, and between the major stresses intervene three syllables, of which the middle has a minor stress. It is this alternation in the weight of the stress which gives its characteristic swing to such a poem as Chesterton's "The Rolling English Road" [OBEV 930].

Trochaic Metres.

Pure Trochaic Metre.

English poets seldom use a pure trochaic metre, partly because of the difficulty of rhyming, and partly because the continual feminine ending that it involves is not pleasing to the English ear. A few very short lyrics in this metre can be found, as Browne's Song "For her gait, if she be walking" [OBEV 251], but the only poem of any length is Longfellow's "Hiawatha," and the metre

of this *tour de force* tends to sound monotonous. It consists of unrhymed lines, each of four stresses, *e.g.*,

" Líke a yéllow léaf in áutumn
Líke a yéllow wáter-lily."

Modified Trochaic Metre.

Ever since the Middle Ages our poets have contrived to combine the advantages of a trochaic metre and of a masculine ending by the simple expedient of shortening the last foot of the line to a stressed monosyllable. This catalectic, or shortened, trochaic line is found both in couplets and in stanza forms. *The seven-syllabled trochaic couplet, also called the trochaic tetrameter*, consists of these catalectic, or shortened, lines rhyming in pairs, and is a gay, tripping measure, as in some passages of Milton's " L'Allegro " [OBEV 318].

" Háste theé nýmph and bring with thée
Jést and yóuthful Jóllity."

Keats uses the metre in " Bards of Passion," and " Fancy " [OBEV 637 and 638].

Lyrics in modified trochaic metre are often found. Herrick uses the seven-syllabled lines rhyming in pairs in " Cherry Ripe " and other lyrics [OBEV 264, 279, 280, 281]. Edmund Blunden, in " Forefathers " [OBEV 965], uses it in a stanza rhyming ABABCC. George Herbert in his lyric " Discipline " [OBEV 291] brilliantly combines five- and three-syllabled lines rhyming ABAB, *e.g.*,

" Thrów awáy Thy ród,
Thrów awáy Thy wráth;
Ó my Gód,
Táke the géntle páth."

Further Variations in Modified Trochaic Metre.

The modified trochaic line is especially subject to further variation.

(*a*) It is often combined with a pure trochaic line, *e.g.*, in Hunt's poem " Jenny Kiss'd Me " [OBEV 600] where the catalectic and the complete trochaic line alternate regularly.

(*b*) It often has an extra unstressed syllable preceding it (anacrusis), as in the second of these lines from Keats' poem " Fancy " [OBEV 638].

" Ín a dárk conspíracý
To | bánish Éven fróm her ský."

The line that results might well be taken for iambic, and there are some passages in English poetry, such as lines in Milton's " L'Allegro " [OBEV 318], which can be described either as irregular trochaic or irregular iambic lines! It depends on what the hearer judges to be the *basic* stress.

Double Trochaic Metre.

Corresponding to double iambic metre there is a double trochaic metre. W. S. Gilbert effectively uses it in many of his patter songs, as in " Ferdinando and Elvira," *e.g.*,

" Thén we lĕt off páper cráckers, eách of which contáined a mŏtto,
Ánd she lĭstened while I rĕad them, till her mŏther tóld her nŏt to."

These lines, like those in double iambic metre, have four major stresses (marked ″), and between the major stresses three syllables, of which the middle carries a minor stress.

A modified double trochaic metre, where the last foot is shortened to a stressed monosyllable, can be recognised in Tennyson's " Locksley Hall," or in Lewis Carroll's verses in " Alice in Wonderland ":

" ' Will you wălk a little făster? ' sáid a whíting tó a snail."

Trisyllabic Metres Generally.

Because of the irregularities incident to verse in anapæsts, dactyls, and amphibrachs, it is not easy to distinguish one trisyllabic metre from another. Swinburne, the past master of trisyllabic metres, often passes with great freedom from anapæstic to dactylic lines within the same stanza.

Anapæstic Metres.

Pure Anapæstic.

Anapæstic metre is used only in short poems, and often conveys a sense of speed and urgency. The chief variation is the omission of one or two of the unstressed syllables at the beginning of a line. Some of the best-known examples of anapæstic verse are Byron's " Sennacherib," Flecker's " The War Song of the Saracens," and Lewis Carroll's parodies, " 'Tis the voice of the lobster " and " You are old, Father William," from " Alice in Wonderland."

The Limerick.

The limerick may be defined as a single anapæstic stanza, having the first two lines of three feet, the next two lines of two feet and a concluding line of three feet, with the rhyme scheme AABBA.

The origin of the limerick is uncertain, but it became popular after the appearance in 1846 of Edward Lear's " Book of Nonsense." Lear's limericks differ from the contemporary type in that his final line is normally a repetition, adding nothing to the sense and repeating one of the previous rhyme words.

Most of our modern limericks are passed on by word of mouth, but some that concisely express some intellectual attitudes have appeared in print, as the following, on " Determinism "—

" There wás a young mán who said ' Dámn!
It appéars to me nów that I ám
Just a béing that móves
In predéstinate gróoves,
Not a táxi or bús, but a trám.' "

Dactylic Metres.

Pure Dactylic.

Like pure trochaic metre, pure dactylic metre has a feminine ending to the line, which makes rhyming difficult and does not satisfy the English ear. Very few serious poems keep consistently to a pure dactylic verse, and Robert Graves' " In the Wilderness " is most unusual in this respect, *e.g.*,

" Christ of His géntleness
Thirsting and húngering
Wálked in the wilderness."

Modified Dactylic Metre.

Normally dactylic metre is modified in that a catalectic line is frequently used, where the final foot is shortened to a trochee or a stressed monosyllable, as in Hood's " Bridge of Sighs " [OBEV 662], the most remarkable dactylic poem in the language, *e.g.*,

" Óne more unfórtunate
Wéary of bréath
Ráshly impórtunate
Góne to her déath."

Shakespeare also uses the catalectic line in the refrain to " Where the bee sucks " [OBEV 140]—

" Mérrily mérrily shăll I live nów
Únder the blóssom that hángs on the bóugh."

It is interesting to note how the catalectic dactylic line of the refrain is matched by the catalectic trochaic line of the verse.

Amphibrach Metres.

Pure Amphibrach Metre.

The amphibrach metre is extremely rare in English, although it occurs occasionally in a few lines, or a refrain, like that to " Blow, blow thou Winter Wind " [OBEV 146]. Laurence Binyon's

"Bablock Hythe" is one of the few poems to use amphibrachs continuously, *e.g.*,

> "Till súnset was rimming
> The Wést with pale flúshes;
> Behínd the black rúshes
> The lást light was dímming."

Modified Amphibrach Metre.

The pure amphibrach line can be used alternating with a catalectic line, shorn of its last syllable, as in Goldsmith's drinking song in "She Stoops to Conquer," Act I, Scene 2, *e.g.*,

> "Let schóol-masters púzzle their bráin
> With grámmar and nónsense and léarning."

Choriambic Metre.

There are few poems in pure choriambic metre. Ruskin's quatrain "Trust Thou thy Love" [OBEV 753] is one of the few examples, *e.g.*,

> "Trúst thou thy Lóve; if she be próud, is she not swéet?"

Choriambic effects are often obtained incidentally, especially in blank verse, when the first foot of a line is a trochee.

Lionel Johnson frequently achieves the same kind of effect in lyric verses by substituting a choriamb for two iambs, as in the poem "By the Statue of King Charles" [OBEV 909], *e.g.*,

> "Cómely and cálm, he rides
> Hárd by his ówn Whitehall."

Sprung Rhythm.

Sprung rhythm was practised by Gerard Manley Hopkins and his followers.

Its distinction lies in the fact that in a foot of verse the first syllable is always stressed, and this stressed syllable may be followed by any number of unstressed syllables from none to three, or even more, as the occasion demands. Hopkins has described sprung rhythm in the Preface to his "Poems."

Quantitative Classical Metres.

Since the Renaissance poets such as Spenser, Coleridge, and Tennyson have from time to time endeavoured to reproduce in English verse the complicated quantitative metres of Greek and Latin verse. The difficulty, if not impossibility, of putting the stress on the long vowel in English has for the most past rendered such experiments interesting only to the scholar.

It should always be remembered that the technical names, such as iamb and trochee, although borrowed from the classics, have in English verse a quite different meaning, referring never to quantity but always to stress.

Metrical Forms of French Origin.

It became fashionable during the last years of the nineteenth century for poets to imitate certain verse forms which had long been practised in France, some of them from the time of the troubadours.

Chaucer and Gower had in the fourteenth century used some of these forms, later English poets had occasionally experimented with some of them, and Swinburne, Austin Dobson, Edmund Gosse, and others did much to adapt and naturalise them, although their intricate rhyming patterns are very difficult to construct in a language so short of rhymes as English. The most popular were the triolet, villanelle, rondeau, ballade, and sestina.

Characteristic of the Anglicised versions are:

1. Freedom as regards metre and length of line.

2. Complicated and exacting rhyme schemes, which permit of no such poetic licence as identical rhyme.

3. A refrain line which recurs in certain stereotyped positions without any alteration of sound, although there may be significant alteration of meaning. Only the sestina is without a refrain.

Triolet.

A triolet is a single stanza of eight short lines. The first line is repeated as the fourth, and the first and second appear again as seventh and eighth. Only two rhymes are used, the scheme being: ABAAABAB.

The triolet was re-introduced into England by Bridges in 1873. Austin Dobson's "A Kiss" is a good example of the form.

> "Rose kissed me today.
> Will she kiss me tomorrow?
> Let it be as it may,
> Rose kissed me today,
> But the pleasure gives way
> To a savour of sorrow;—
> Rose kissed me today,—
> Will she kiss me tomorrow?"

See also Dobson's triolet "I intended an Ode" [OBEV 828].

Villanelle.

The villanelle has five stanzas, each of three lines, followed by one stanza of four lines. It has a refrain which consists of the first and third lines of the first stanza. These lines alternately form the last lines of the four middle stanzas, and reappear as a concluding couplet to the poem. Only two rhymes are employed throughout. Stanzas one to five rhyme ABA and stanza six ABAA.

Austin Dobson wrote several villanelles including the well-known "On a Nankin Plate." The following of Henley's is both a good example and description of the form.

Villanelle by W. E. Henley:

> A dainty thing's the Villanelle
> Shy, musical, a jewel in rhyme,
> It serves its purpose passing well.
>
> A double-clappered silver bell
> That must be made to clink in chime,
> A dainty thing's the Villanelle;
>
> And if you wish to flute a spell,
> Or ask a meeting 'neath the lime,
> It serves its purpose passing well.
>
> You must not ask of it the swell
> Of organs grandiose and sublime—
> A dainty thing's the Villanelle;
>
> And, filled with sweetness, as a shell
> Is filled with sound, and launched in time,
> It serves its purpose passing well.
>
> Still fair to see and good to smell
> As in the quaintness of its prime,
> A dainty thing's the Villanelle.
> It serves its purpose passing well.

Rondeau.

A rondeau is a short and compact verse form. It has thirteen lines, usually of eight syllables, which use only two rhymes, and in addition a refrain, usually of four syllables, which introduces a third rhyme. This refrain consists of the first half of the opening line and is twice repeated, thus giving the rondeau fifteen lines all told. The rondeau is divided into three stanzas with the following rhyme scheme: AABBA: AAB + refrain, C: AABBA + refrain C.

Austin Dobson wrote many rondeaus to this exacting plan, including the ingenious "You bid me try" and "In After Days" [OBEV 830].

A Rondeau by Austin Dobson:

You bid me try.

You bid me try, Blue-Eyes, to write
A Rondeau. What!—forthwith?—to-night?
Reflect. Some skill I have, 'tis true;—
But thirteen lines!—and rhymed on two!
"Refrain," as well. Ah, hapless plight!

Still, there are five lines,—ranged aright.
These Gallic bonds, I feared, would fright
My easy Muse. They did, till you—
You bid me try!

That makes them eight. The port's in sight:—
'Tis all because your eyes are bright!
Now just a pair to end in 'oo'—
When maids command, what can't we do.
Behold!—the RONDEAU, tasteful, light,
You bid me try!

1876

Roundel.

The roundel is a variation of the rondeau. Swinburne in his "Century of Roundels" wrote a hundred, and his pattern is usually followed. It consists of nine full lines, plus the refrain (consisting of the opening half of the first line), which is twice repeated, giving eleven lines all told. Only two rhymes are used throughout. The roundel is divided into three stanzas with the following rhyme scheme: ABA + refrain B; BAB; ABA + refrain B.

Swinburne's roundel called "The Roundel" is especially interesting.

Rondel.

The rondel is a form of verse similar to the rondeau. The modern English version consists of fourteen lines all told. Only two rhymes are used, and the initial two lines are repeated as lines 7 and 8 and again as lines 13 and 14. The rondel is frequently arranged in three stanzas with a rhyme scheme as follows: ABBA; ABAB; ABBAAB.

The rondel was revived in the nineteenth century by Bridges, Dobson, Gosse and Henley, and Dobson's "Love comes back to his vacant dwelling" is one of the best known.

Ballade.

There are several kinds of ballade, but the most popular modern form consists of three eight-lined stanzas followed by an envoy of four lines. Each of the stanzas and the envoy end with a refrain. The rhymes of the eight-lined stanzas are ABABBCBC, and of the envoy BCBC.

Austin Dobson wrote several ballades of this kind, the best known being, "This was the Pompadour's fan," and "And where are the galleons of Spain?"

Chaucer's "Balade," "Hyd, Absolon, thy gilte tresses clere," is of an earlier seven-lined type without an envoy.

A ballade by Austin Dobson:

The Ballad of the Thrush.

Across the noisy street
I hear him careless throw
One warning utterance sweet;
This faint at first, and low
The full notes closer grow;
Hark! What a torrent gush!
They pour, they overflow—
Sing on, sing on, O Thrush!

What trick, what dream's deceit
Has fooled his fancy so
To scorn of dust and heat?
I, prisoned here below,
Feel the fresh breezes blow;
And see, thro' flag and rush,
Cool water sliding slow—
Sing on, sing on, O Thrush!

Sing on. What though thou beat
On that dull bar, thy foe!
Somewhere the green boughs meet
Beyond the roofs a-row;
Somewhere the blue skies show,
Somewhere no black walls crush
Poor hearts with hopeless woe—
Sing on, sing on, O Thrush!

Envoy.

Bird, though they come, we know,
The empty cage, the hush;
Still, ere the brief day go,
Sing on, sing on, O Thrush!

1883

The Chant Royal.

The chant royal is a longer form of ballade. It has five stanzas of eleven lines and an envoy of five lines.

The rhyme scheme is ABABCCDDEDE, and the envoy has rhyme DDEDE.

The Sestina.

The sestina has six stanzas, each of six lines. The end words to the lines of the first stanza are repeated as end words in the other five stanzas, but in a different and stereotyped order. The poem concludes with an envoy.

The first sestina published in English was in Spenser's "Shepheardes Calender" (1579). Swinburne wrote many, including "I saw my soul at rest upon a day."

The Clerihew.

The clerihew is an amusing quatrain, so called after its inventor Edmund Clerihew Bentley. It disdains regular metre and depends on the simple rhyme scheme AABB. The distinctive characteristic of the clerihew is that it is concerned with some eminent person, who is named in the first line and then described in a wilfully fanciful way, the matter being dictated by the exigencies of the rhyme, as in Bentley's clerihew on J.S. Mill.

"John Stuart Mill,
By a mighty effort of will,
Overcame his natural bonhomie
And wrote 'Principles of Political Economy.'"

We might invent a clerihew for Pears Cyclopædia, and say

"You will find *Pears Cyclopædia*
A simpler and speedier
Aid in your search for verity
If you do not use it with levity."

Free Verse or Vers Libre.

It is hardly possible to define anything so vague as Free Verse. It is characterised by a greater intensity of feeling and a more elevated language than is usual in prose, and has a rhythm that is different from that of poetry in that it is irregular; it has rhythm but not metre.

Free Verse is arranged in lines, but these lines have an indefinite number of syllables. They have balance but no regularly recurring pattern of stress, and no rhyme.

The best-known writer of Free Verse is Walt Whitman, whose "Leaves of Grass" was published in 1855.

VI. CONCLUSION.

The foregoing account is no more than a description of our traditional verse forms. It in no way implies that verse is written according to rules.

We have only to look at Shakespeare's lyrics [OBEV 133–174] to realise how brilliantly free and inventive the poet can be in devising new and delightful patterns of verse—many of them so subtle as to be very difficult to define. All that the students and critics can do is to follow in the poets' wake, endeavouring to understand and elucidate the forms that the maker has created.

HOW TO ENJOY A POEM

Many people who enjoy listening to music, and seeing paintings, find it difficult to appreciate poetry, and a few suggestions as to how we may approach a poem may be useful. A very good practice is to read the poem aloud. Poetry uses the musical sounds and rhythms of words, and although the printed words on the page may seem flat, like a score of music, the actual sound and rhythm of the spoken words help the lines to come alive. It is best when reading or hearing a poem for the first time to keep an open mind, ready to receive whatever impression it may make and trying to suspend judgment. Someone was once looking at a piece of modern statuary that he could not understand and was foolishly condemning, when a friend who was an art critic said, " Just walk round it." In the same way we can, as it were, walk round the poem until its significance begins to dawn on us. We must remember first and foremost that a poet normally uses words not literally, but with a figurative meaning. He loves to speak of one thing as if it were another. When Keats describes the pleasure he has had in his wide reading he speaks of books as if they were countries and he himself a traveller.

" Much have I travell'd in the realms of gold,
And many goodly states and kingdoms seen."
OBEV 641.

Making out the Meaning. Remembering always that the poet normally speaks in images, we need to pay close attention to the words he uses if we are to enjoy their full meaning. I. A. Richards describes in his book, *Practical Criticism*, 1929, how he gave a group of people, undergraduates and others, unfamiliar poems to read and then asked for their written interpretations. In the light of these, he formulated certain principles which aid one in " making out the meaning," which as he rightly says is the fundamental problem. He distinguished four kinds of " meaning ": the plain " sense " of the poem, the " feeling," the " tone," and the " intention," and many readers of poetry now find it enlightening to consider a poem from these four aspects. The plain " sense " is arrived at simply by deciphering the words, and incidentally the punctuation, in an attempt to find out what the poet actually says. Readers do not always take the trouble to do this. Another aspect of meaning is the poet's " feeling " for his subject. Does he, for instance, express awe, tenderness, anger, amusement? Then there is his " tone " towards the reader. Is it confidential, or appealing, or didactic? Finally Richards speaks of the " intention " of the poem, the whole aim that the writer is trying to pursue.

Distinguishing Subject and Theme. Another illuminating way of looking at a poem is to distinguish between its subject and its theme, for they are seldom identical. A poet loves to transpose his experience into another setting, and below his surface narrative or description, we usually find a secondary meaning, the theme, which is the core of the poem. Often there are many such themes, subtly woven together. Keats chose for the subject of one of his odes a Grecian urn (OBEV 632), but the themes of the ode are manifold, one being the magic of art which captures for ever the fleeting moment. Similarly, Shelley addressed an ode to the West Wind, and here one of the main themes is a plea for poetic inspiration (OBEV 617).

The Formal Aspects of the Poem. Other pointers to its meaning are the formal pattern of the poem—the literary form in which it is cast, the versification (*see* M4–21), the kind of imagery, or figures of speech (*see* M23–24). The great poet suits the form to the meaning, as the glove fits a hand, and although the form, like the glove, is something external, it can give a clear indication of what is within.

Study of Shakespeare's Sonnet 73 (OBEV 162)

' That time of year thou may'st in me behold,
When yellow leaves, or none, or few do hang
Upon those boughs which shake against the cold—
Bare ruin'd choirs where late the sweet birds sang.
In me thou see'st the twilight of such day,
As after Sunset fadeth in the West,
Which by and by black night doth take away,
Death's second self that seals up all in rest.
In me thou see'st the glowing of such fire,
That on the ashes of his youth doth lie,
As the death-bed, whereon it must expire,
Consum'd with that which it was nourish'd by.
This thou perceiv'st, which makes thy love more strong,
To love that well, which thou must leave ere long."

Kinds of Meaning. Searching for the plain sense," we find here three clearly defined images, the first of very late autumn,

" When yellow leaves, or none, or few do hang
Upon those boughs which shake against the cold—"

Then follows an image of twilight, the brief phase after the sunset has faded and before the fall of night. The third image is of a dying fire, glowing amid its ashes. All these, says Shakespeare, " thou may'st in me behold." All three, then, suggest that phase in man's life that follows the prime, the decline towards death. The " feeling " of these first twelve lines is sombre and foreboding, and in its " tone " the poem speaks to one alone—" thou may'st behold." " thou see'st." Then when we reach the concluding couplet we perceive the " intention " of the poem. It is a love poem.

" This thou perceiv'st, which makes thy love more strong,
To love that well, which thou must leave ere long."

The sober reflections on decline and death are set against a statement of steadfast love.

Subject and Theme. We can also approach the poem trying to distinguish " subject and theme." Then we perceive more clearly the theme of the imminence of death, which gradually develops and gathers momentum. For instance, the trees are called " bare ruin'd choirs " where the birds no longer sing, and this suggests a ruined empty abode from which the voice has flown, the spirit departed. Then the " black night " which succeeds twilight is " Death's second self," and the fire lies on the ashes " As the death-bed, whereon it must expire."

The very colours of the poem are suggestive. A picture is painted in sombre greys and black, lit up by a dull glow soon to be engulfed in darkness, the yellow leaves on the bough, the sunset fading into twilight, the fire dying on the ashes. It is like the chiaroscuro of a Rembrandt painting.

Formal Pattern. If we now attend to the formal patterns of the poem we find how exquisitely they match the sense. The poem is a sonnet (*see* M18), that is a brief lyric poem of only fourteen lines, expressing feeling in a taut and concentrated way. There is no room for digression: every word counts.

As we expect from a Shakespearean sonnet we find the rhyme scheme ABAB CDCD EFEF GG. This indicates that the poem will naturally take the design of three quatrains and a concluding couplet. Then how exquisitely and precisely each image is contained within the brief compass of its quatrain, and how apt are the metaphors in which the images are expressed.

Even so we have no longer exhausted the significance of this short poem. Much is left to discover, and light is shed by the sonnets that precede and follow it in Shakespeare's sequence.

III. FIGURES OF SPEECH

We constantly use figurative language without realising it. When we say that we are "browned off," "fed up," "at the end of our tether," we do not expect to be taken literally. We are in fact employing metaphors.

An understanding of metaphors and other figurative expressions enables us to use our language with greater confidence and effectiveness. It also helps us to understand more fully what others have written. Especially is it valuable when we read a good novel, play, or poem, for to the creative writer figurative language is as natural as the air he breathes.

The following guide to our figures of speech is arranged alphabetically for ease of reference.

Alliteration. A kind of repetition. Two or more words in close succession begin with the same letter, or sound, usually a consonant. Up to the fourteenth century much English verse was written according to an alliterative principle, as in this modernised quotation from "Piers Plowman."

"I had *w*andered me *w*eary so *w*eary I rested me
On a *b*road *b*ank by a merry-sounding *b*urn."

A strong tendency to alliteration still survives in our poetry. Shakespeare ridicules it in the mechanical's play in "A Midsummer Night's Dream" (Act V, Scene 1) in such lines as—

"Whereat, with blade, with bloody blameful blade,
He bravely broach'd his boiling bloody breast."

Anti-climax. See Bathos.

Antithesis. A figure of speech where ideas are so set out that they are in sharp contrast to each other, *e.g.*,

"Better to reign in Hell than serve in Heav'n."
Milton.

"To err is human, to forgive divine."
Pope.

Apostrophe. A figure of speech where the speaker or writer suddenly breaks off and directly addresses some other person who may be present either in the flesh or only in the imagination. Often it is not a person but a thing, abstraction, or personification that is addressed, as in Milton's famous apostrophe, "Hail, holy light" in "Paradise Lost," Book III, line 1. Apostrophe can be used with comic effect, *e.g.*,

"She turns, O guardian angels stop her
From doing anything improper."

(This couplet is also, incidentally, an example of bathos.)

Assonance. (1) Assonance is correspondence of vowel sounds. For instance, in the opening lines of the "fairy song" in "A Midsummer Night's Dream" (Act II, Scene 3) there is a play on only three vowels, and this repetition helps towards the effect of a magic charm, *e.g.*,

"Philomel, with melody, Sing."

In Tennyson's poem "Break, break, break" the repetition of the "o" sound in the second line is like an outcry of grief, *e.g.*,

"On thy cold grey stones, *O* sea."

(2) Assonance is sometimes used instead of rhyme, especially in early folk poetry. Here there is correspondence of one word with another in the accented vowel and any vowels which follow, but not in the consonants, *e.g.*, in "King Estmere," "Spain" is rhymed with "same," and "barone" with "home."

Bathos or Anti-climax. A figure of speech that consists of a sudden and ludicrous descent from lofty to trivial things. In "The Rape of the Lock" Pope wittily used bathos to satirise the frivolity of the woman of fashion, who lacking all sense of proper feeling, casts the same "screams of horror," and "shrieks to pitying heav'n,"

"When *husbands* or when *lapdogs* breathe their last."

The careless writer may fall to bathos which is unintentionally comic in its effect. The word "bathos" in Greek means "depth."

Climax. A figure of speech where ideas are set out in such a way that each rises above its predecessor in fable. In Greek the word "climax" means a ladder. One of the finest examples is in Shakespeare's "The Tempest" (Act IV, Scene 1) when Prospero says,

"And like the baseless fabric of this vision
The cloud-capp'd towers, the gorgeous palaces,
The solemn temples, the great globe itself,
Yea, all which it inherit, shall dissolve."

Epigram. A concise and pointed saying, effective by its wit and ingenuity. It often uses antithesis. S. T. Coleridge's definition of this form is in itself an epigram, *e.g.*,

"What is an epigram? a dwarfish whole:
Its body brevity, and wit its soul."

Euphemism. A figure of speech where a harsh or distressing expression is replaced by one that is gentler, if less accurate. Thus we may call a lie a "flight of fancy," or a "terminological inexactitude." There is a striking instance of euphemism in "Macbeth" (Act I, Scene 5), when Lady Macbeth, planning the murder of her guest, Duncan, says, "He that's coming must be provided for."

Hypallage or "Transferred Epithet." A figure of speech where an adjective, or adverb, is separated from the word to which it belongs grammatically, and is transferred to some other word in the sentence, its unusual position giving it a kind of emphasis. The word "obsequious" is thus transferred in the sentence "A lacquey presented an obsequious cup of coffee."

Hyperbole. A figure of speech where there is a deliberate use of exaggeration for the sake of effect as in the phrase "tons of money." Lady Macbeth uses hyperbole when she says, "Here's the smell of blood still: all the perfumes of Arabia will not sweeten this little hand" (Act V, Scene 1).

Writers of film trailers frequently indulge in hyperbole.

Innuendo. A figure of speech where something is hinted at, or suggested, but not openly stated. Dickens uses innuendo to suggest Scrooge's stinginess by saying, "Darkness was cheap, and Scrooge liked it."

Irony. (1) A figure of speech where the speaker says one thing but intends the opposite to be understood. Shylock uses the word "courtesies" ironically when he says,

"Fair sir, you spit on me on Wednesday last,
You spurn'd me such a day; another time
You call'd me dog; and for these courtesies
I'll lend you thus much moneys."
"Merchant of Venice" (Act I, Scene 3).

The use of irony can clearly be seen in Shakespeare's "Julius Cæsar" in Antony's well-known speech to the citizens. They gradually realise

that when Antony repeats that Brutus and the rest are "honourable men," he is speaking ironically, and intends the opposite. When they fully perceive this they cry, "They were traitors . . . villains, murderers." ("Julius Cæsar," Act III, Scene 2.)

(2) *Dramatic irony* is the use of words which have a second inner significance that is not realised by some of the actors in a scene. For instance, in Sheridan's "School for Scandal," Act IV, Scene 3, Sir Peter admires Joseph Surface's useful screen, and Surface replies, "Oh yes, I find great use in that screen." He and the audience know, but Sir Peter does not, that at that very moment the screen is concealing Peter's own wife who had rashly visited Joseph.

It is helpful to remember that in Greek the word "irony" means "dissimulation."

Litotes. A figure of speech which is really a special kind of understatement (or Meiosis). Instead of making a positive statement (*e.g.*, "This is a difficult task") we might use Litotes, and say "This is no easy task," thus expressing a positive by the negative of its opposite.

Malapropism. An amusing inaccuracy in vocabulary. Words that have an accidental similarity in sound may become confused in the speaker's mind and the wrong word may come uppermost. Thus Mrs. Malaprop complains that the disobedience of her niece gives her, not "hysterics," but "hydrostatics." It is not surprising that Mrs. Malaprop, of Sheridan's "The Rivals," has given her name to this kind of verbal confusion, though many before her time, including humble folk in Shakespeare's plays, have uttered malapropism. Bottom, in "A Midsummer Night's Dream," says that in the wood they "may rehearse more obscenely" when he means "obscurely."

Meiosis. A figure of speech where a deliberate understatement is made for the sake of effect. English people are especially fond of Meiosis and often use it colloquially, in such an expression as "He made a very 'decent' contribution," meaning a very "generous" contribution. The full meaning of what we intend is often conveyed by the tone of voice, *e.g.*,

"This is *some* war."

Metaphor. It is helpful to think of the figure of speech, metaphor, as a condensed simile. In metaphor one thing is not merely *compared* to another, as in simile, but is boldly spoken of as if it actually *were* that other. Thus Bacon, in the following metaphor, does not say books are *like* food, but speaks of them as if they actually *were* food, *e.g.*, "Some books are to be tasted, others to be swallowed, and some few to be chewed and digested."

Metaphor is usually defined as the transfer of a name, or descriptive term, to some object to which it is not properly applicable, thus making an implicit comparison. Shakespeare uses nautical terms to describe our human situation when Brutus says,

"There is a tide in the affairs of men which, taken at the flood, leads on to fortune" ("Julius [illegible]" Act IV, Scene 3).

In *Mixed Metaphor* two or more inconsistent metaphors are used of the same object, as when, speaking of a suspicion, someone said, "I smell a rat; I see it in the air; but I will nip it in the bud."

Metonymy. A figure of speech where a person or thing is not named directly, but by some associated thing. Instead of saying, "The prisoner addressed the magistrate," we might use metonymy, and say, "The prisoner addressed the bench." Similarly, "a speech from the Lord Chancellor" is sometimes called "a speech from the Woolsack."

Onomatopœia. The use of words which imitate or echo the sounds they suggest, *e.g.*,

"Seas half-frozen slushed the deck with slime."
Masefield.

Oxymoron. A figure of speech where words that are usually contradictory are combined in one expression, *e.g.*, "bitter-sweet."

"I know this is a joyful trouble to you."
"Macbeth," Act II, Scene 3.

Paradox. A figure of speech where a statement is made that at first sight seems contradictory, or absurd, *e.g.*,

"The rule of the road is a paradox quite:
If you keep to the left, you are sure to be right."

and

"The child is father of the man."
Wordsworth.

Pathetic Fallacy. A figure of speech where it is assumed that things of nature have feelings like those of human beings, *e.g.*,

"And daffadillies fill their cups with tears."
Milton.

In Greek "pathos" means "feeling."

Personification. A figure of speech where some abstraction, or some inanimate thing is represented as a person, *e.g.*,

"Rule, Britannia."

"But look the dawn in russet mantle clad
Walks o'er the dew of yon high eastern hill."
Hamlet, Act I, Scene 1.

Personification is really a special kind of metaphor.

Pun. The use of words so as to convey a double meaning, as in Belloc's couplet

"When I am dead, I hope it may be said
"His sins were scarlet, but his books were read.'"

In the three puns that follow there is a suggestion of a banking transaction! "The Egyptians received a check on the bank of the Red Sea which was crossed by Moses." Puns, which were popular in the nineteenth century, especially with Lamb and Hood, are now out of favour.

Simile. A figure of speech which makes a comparison pointing out a similarity between things otherwise unlike It is usually introduced by "like" or "as," *e.g.*,

"Men fear death as children fear to go in the dark."
Bacon.

"His own thought drove him like a goad."
Tennyson.

Spoonerism. An accidental transposition of the sound of two words, so called after Rev. W. A. Spooner, warden of New College, Oxford, *e.g.*,

"You have hissed all my mystery lectures" for "You have missed all my history lectures."

Synecdoche. A figure of speech where the name of a part is used for the whole, or the whole for the part, *e.g.*,

"A fleet of a hundred sail",

meaning of a hundred ships.

Synecdoche is really a special kind of Metonymy.

Transferred Epithet. See Hypallage.

IV. LITERARY FORMS

Allegory. A description or story which has a second and deeper significance below the surface. The characters are really personifications, usually representing some vice or virtue. Allegory flourished in the Middle Ages, but the best-known allegory in the world is Bunyan's "Pilgrim's Progress" (1678), which has been translated into over a hundred different languages and dialects. On the surface "The Pilgrim's Progress" is the story of a journey in which the hero encounters many difficulties but at last reaches his destination. Its inner meaning is the progress of the Christian soul through life on earth. Spenser's "Faerie Queene" (1589 and 1596) is a more subtle and complex allegory, capable of several interpretations, religious, ethical, and political. Allegory has been described as extended metaphor. *See* M24.

Autobiography. The story of a man's (or woman's) own life, written by himself. The autobiography is becoming increasingly popular, recent excellent examples being Stephen Spender's *World within World*, Richard Church's *Over the Bridge* and Laurie Lee's *Cider with Rosie*.

Ballad. There are two chief types of ballad:

1. A light song, often sentimental, as was the Victorian ballad, or a popular song, often of a personal kind, praising or attacking some notability.

2. A traditional poem, passed on by word of mouth. Many of our traditional ballads date from the 15th century. They tell some stirring tale, as do the many ballads about Robin Hood. Sometimes they record an actual occurrence, like the ballad "The Battle of Otterbourne," which tells of a Border skirmish, fought in 1388. Such ballads are enlivened by lively dialogue, and they use a special kind of stanza, which is described on M17.

Ballade. A short highly stylised poem, with a strict verse form. *See* M21

Biography. A narrative telling the life story of some actual person, usually a well known figure. The most famous biographer of classical times was Plutarch, who in the 1st century A.D. wrote his series of parallel "Lives" of twenty-three Greeks and twenty-three Romans. The English translation of this provided Shakespeare with some of the plots of his plays. Boswell's *Life of Samuel Johnson* (1791) is our best-known English biography.

Burlesque. The aim of burlesque is to make us laugh by ridiculing the work of some other writer. Sometimes it treats his serious subject in a mocking way. Sometimes it takes the form of an absurd imitation or caricature of his style. Some of our most successful burlesques are dramatic in form, like Sheridan's "The Critic," produced in 1779. This has a play within a play, called "A Tragedy Rehears'd," a brilliant burlesque of the sentimental, historical plays so popular in his time. Danny Kaye's film, "The King's Jester," is a burlesque of pseudo-historical films.

Chant Royal. A poem of a strictly formal kind, French in origin. *See* M21.

Clerihew. A single-stanza verse form, four lines long. *See* M21.

Comedy. A play which is happy and amusing in tone, but not necessarily light or superficial. A comedy always has a fortunate conclusion. Shakespeare's "Twelfth Night" and Oscar Wilde's "The Importance of being Earnest" are typical examples.

Drama. A play in verse or prose, where the story is unfolded and the characters represented through the actions and speeches of actors on a stage. It is essential to good drama that there should be some kind of dynamic action and some conflict between the characters. In comedy the conflict is usually open and external. "As You Like It," for instance, begins with a quarrel between Orlando and Oliver. But most of the world's finest tragedies reveal also an inner conflict in the soul of man. In "Hamlet" the hero is at odds with many people, including his mother, the king, Ophelia, Polonius, and Laertes, but all these struggles are of secondary significance, compared with the conflict in his own mind. Even a play like "Waiting for Godot," which reduces incident and conflict to a minimum, must make some concession to the demand of the audience for the dynamic. Drama cannot be static. Occasionally poets have written dramas which they knew were not practicable for the stage. Shelley's lyrical dramas, "Prometheus Unbound" and "Hellas," are of this kind. *See* Section I.

Eclogue. In classical literature a brief poem, usually in the form of a dialogue between shepherds. It was a popular form in the time of the Renaissance; Spenser's "Shepheardes Calendar" (1579) consists of twelve eclogues one for each month of the year.

Elegy. A lyric poem of lamentation for the dead. Gray's "Elegy in a Country Church-yard" (1750) is the best-known English elegy. It reflects in a general way on the "destiny obscure" of the humble folk who are buried in a quiet church-yard, probably that of Stoke Poges, but most elegies mourn the death of only one person. Such are Shelley's "Adonais" (1821), on the death of Keats, and Matthew Arnold's "Thyrsis" (1867), commemorating his friend Arthur Hugh Clough. Tennyson's "In Memoriam" (1850) is unusual, in that it is not a single elegy, but a series of elegiac poems, inspired by the poet's grief for the death in 1833 of his friend Arthur Hallam.

Epic. A very long narrative poem, usually consisting of several books. The epic tells of the splendid deeds of some hero of history or legend and is frequently concerned with war. Some of the world's greatest epics are the Greek "Iliad" and "Odyssey," ascribed to Homer, the Latin "Aeneid" of Virgil, the Hindu "Mahabharata," and Milton's "Paradise Lost," whose hero is God himself. The epic is distinguished by its sustained dignity of style.

Epilogue. *See* Prologue.

The word essay, derived from the French, means literally an "attempt" or "endeavour," and as a literary term it applies to a short prose composition which attempts to present the author's reflections on any subject he chooses. As a literary form the essay derives from the French "Essais" of Montaigne, first translated into English by Florio in 1603. Our first English essayist was Francis Bacon, who published between 1597 and 1625 three volumes of his essays, brief, pithy, and objective in character. In course

of time the essay has become more subjective and personal, especially in the hands of Lamb, Hazlitt, and contemporary writers.

Extravaganza. A composition, musical or literary, which uses improbable and fantastic elements and incidents. A good example of narrative extravaganza is Thackeray's *Rose and the Ring* (1855), in which, for instance, Gruffanuff's husband, the footman, is, because of his rudeness, turned into a door-knocker. Extravaganzas are frequently dramatic in form, and most pantomimes may be regarded as such.

Fable. A very brief story designed to teach some lesson or moral. The characters of the story are often animals, birds, or insects, which converse like human beings. The most famous of all fables are those attributed to Aesop, and those of La Fontaine, the French writer of the 17th century.

Farce. A species of dramatic comedy whose whole aim is to excite laughter. It does not scruple to use improbable characters and incidents and absurd situations. "Charley's Aunt" is a typical farce.

Lampoon. A coarse satire (q.v.) attacking an individual. Lampoons are usually short. The word itself is derived from a French word meaning "drinking song."

Limerick. A single-stanza verse form, 5 lines long and with a formal metre and rhyme scheme. *See* **M19.**

Lyric. In ancient Greece a lyric was originally a poem meant to be sung to the accompaniment of the lyre, a stringed musical instrument rather like a small harp. Later the word was used for a poem with song-like qualities: short, usually divided into verses, and expressing the feelings of the poet. The lyric flourished in England in the Elizabethan age as witnessed by the lovely lyrics scattered through Shakespeare's plays. Neglected in the 18th century, it became popular again with the Romantic poets of the 19th century. Odes, elegies, and sonnets are all species of lyrics.

Mask or Masque. A dramatic entertainment performed by amateurs and originating in the court masquerade. The action or plot of the masque is of the slightest and there is little concern with portrayal of character, for the masque gives pleasure by means of its verse, music, and dancing, and its elegant costume and scenery. It was very popular in the 16th and 17th centuries, and from 1605 Ben Jonson wrote many court masques, for which Inigo Jones designed original costumes and settings. Our best-known examples are Shakespeare's masque in Act IV of "The Tempest" and Milton's "Comus."

Melodrama. There are two meanings of the word melodrama.

1. In the early 19th century a melodrama meant a play, usually of a romantic and sensational kind, in which songs were inserted, and where an orchestra accompanied the action. The musical comedy of today might be regarded as its modern counterpart.

2. Today the word melodrama is used of an inferior kind of play, which deliberately excites the emotions by its sensational and violent happenings, but which has a happy ending. We should be careful to distinguish melodrama, which uses violence for its own sake, from serious plays, like "Hamlet" or "King Lear," where violent acts are only incidents necessary to a profound interpretation of human conduct.

Memoirs. The word is normally used of a record of events of which the author has some personal experience or special source of information.

Miracle Plays. Mediæval verse plays produced from the late 14th to 16th centuries by the town guilds and performed in the market-place, or other suitable open space. They consisted of a series of dramatised stories from the Bible or Lives of Saints. Each scene would be allotted to one of the guilds, which was then responsible for its production on a wheeled stage. As soon as the actors of one guild had completed their scene, their stage would be trundled off, sometimes to another rendezvous, and would itself be succeeded by another stage with its scene, until a whole cycle of episodes had been performed. Four great cycles of miracle plays are still extant, called after the towns where they were probably performed, York, Coventry, Chester, and Wakefield. The Wakefield cycle is often called the Towneley cycle. The plays have not only a strong religious sense but also a lively comic spirit. The Towneley cycle has some especially racy comic scenes. One popular incident shows the noisy quarrel that results when Noah's wife refuses to go into the ark.

Mock Heroic. A species of parody (*q.v.*), caricaturing some play or poem written in a lofty and high-flown style. "The Rehearsal" (1672), by Villiers, is typical. It is an absurd imitation ridiculing the artificial and high falutin' heroic plays which were then in vogue.

Monody. In Greek literature an ode sung by a single voice, like our solo in music. In English literature it signifies a poem of mourning for someone's death. The elegies "Lycidas," by Milton, and "Thyrsis," by Matthew Arnold, were both called monodies by their authors.

Monologue. Originally a scene where one person of the drama spoke alone. Today it usually means a dramatic composition for a single actor, such as the well-known Lancashire monologues presented by Stanley Holloway. The word is also sometimes used as meaning soliloquy.

Moralities or Morality Plays. Mediæval verse plays of an allegorical kind, which attempted to teach lessons of virtue, the persons of the drama usually being not real people, but personifications. Most Moralities date from the 15th century, the best known being "Everyman," which is Dutch in origin. The hero, Everyman, is summoned by Death, and vainly appeals for help to his friends, Fellowship, Kindred, Goods, Knowledge, Beauty, and Strength, but all fail him. Only his own Good Deeds will consent to accompany him on his last journey.

Mysteries or Mystery Plays. Some modern writers use the term "Mystery play" instead of "Miracle play" (*q.v.*). It is really an alternative title. One critic tried to distinguish between "Mystery plays," as concerned with stories from the Gospels, and "Miracle plays," as concerned with the lives and deeds of Saints, but this distinction is not usually followed.

Novel. A lengthy prose fiction in narrative form, telling a realistic story of people and their doings. Its chief interest is in character and incident. The first English novelist was Samuel Richardson, whose novels, especially *Pamela* (1740–41) and *Clarissa Harlowe* (1747–48), had a European reputation. In the present century writers like James Joyce, and Virginia Woolf have written what have been called novels of the "stream of consciousness," where the interest lies not so much in the incidents as in the mind's response to events, and reflections. *See* **M3–13.**

Ode. In classical literature an ode was a poem to be sung. In English literature it signifies a

lyric poem, usually in rhyme, and is seldom longer than 150 lines. It is usually in the form of an address, and lofty in its feeling and style. The ode was popular with the romantic poets. Some of our best known are Shelley's "Ode to the West Wind," and Keats' "Ode to a Nightingale," "Ode on a Grecian Urn," and "To Autumn," all of them published in 1820.

Parable. A parable is an arresting simile or metaphor from nature or common life, which may be elaborated into a life-like story. It presents a situation which at a certain point implies some correspondence with ethical or religious principle. *See* C. H. Dodd's *The Parables of the Kingdom.*

Parody. A literary caricature, which mimics the themes and style of some other author in such a way as to make his faults seem absurd and laughable. J. C. Squire's *Tricks of the Trade* is an amusing collection of his skilful parodies of such writers as Byron, Wordsworth, and Masefield.

Pastoral. A pastoral poem, romance, or play is one in which the life of shepherds or of simple rustic folk is portrayed in an idealised way. Originating in Greek literature, the pastoral was revived at the time of the Renaissance. Spenser's "Shepheardes Calendar" consists of twelve pastoral eclogues. Shakespeare's "As You Like It" is a pastoral play. Milton's "Lycidas" is a pastoral elegy and his "Comus" a pastoral masque. There is usually in the pastoral a deeper meaning below the surface. A critic has said, "The shepherd's cloak was the acknowledged disguise of the lover, the poet, the courtier, the pastor of souls, the critic of contemporary life." In the pastoral form the charm of a simple setting and deeper significance are combined.

Prologue and Epilogue. Generally speaking, a prologue means a foreword, or preface, and an epilogue an appendix to a literary work, but the terms are often used more specifically when referring to a play. Here the prologue is a short speech in verse or prose spoken to the audience by one of the actors before the play begins, the epilogue a similar speech after its conclusion. The prologue endeavours to put the audience into a receptive state of mind, the epilogue to ask for a kind reception to the play. Shakespeare's "Romeo and Juliet" has a prologue, his "As You Like It" an epilogue, spoken by Rosalind, who says, "Good plays prove the better by the help of a good epilogue." In the 18th century it was customary for a leading actor to speak the prologue and for a leading actress to make a plea for the play in the epilogue.

Romance. The romance of the early Middle Ages was a fictitious tale in verse, telling the adventures of some hero of chivalry, the interest being in the incidents, sometimes of a supernatural kind, rather than in character. The most famous of these early romances is the French "Chanson de Roland" of the early 12th century. In the later Middle Ages a romance might be written in prose. In the 16th and 17th centuries a romance meant a tale in either prose or verse in which the scenes and incidents were remote from those of real life. Sir Philip Sidney's "Arcadia" (1590), written to entertain his sister, is of this type. Today the word romance is rather vaguely used of a tale of somewhat improbable events. Sir Henry Rider Haggard wrote several such romances, including *King Solomon's Mines* (1886) and *She* (1887).

Rondeau. A poem of a strictly formal kind, French in origin. *See* M20.

Rondel. A poem similar in form to the rondeau. *See* M21.

Roundel. A variation of the Rondeau. *See* M21.

Saga. The word saga, which is of Norse origin and means story, is applied to the mediæval prose narratives of Iceland and Norway, especially those concerned with the traditions of Icelandic families and Norwegian kings. William Morris, in his "Earthly Paradise," gives in "The Lovers of Gudrun" a version of the Icelandic Laxdæla Saga.

Satire. A work in either verse or prose attacking folly and vice. Pope's "Dunciad," in verse, published between 1728 and 1743, ridicules contemporary authors and literary follies in a massive attack on dullness and literary hacks. Swift's *Gulliver's Travels* (1726), which on the surface is a series of prose tales of travel to imaginary countries, is actually a comprehensive satire. It begins, in the first book on "Lilliput," with incisive ridicule of the squabbles between English political parties and religious sects, and culminates, in the final book on the Houyhnhnms, in a devastating attack on all that is bestial in human nature. Samuel Butler's *Erehwon* (an anagram of Nowhere), published in 1872, also uses a prose travel tale in his satirical exposure of Victorian convention and hypocrisy. Although not precisely satires, many of Shaw's plays are satirical in spirit. "Arms and the Man" may be considered in one of its aspects as a satire on war.

Sestina. A poem of a strictly formal kind, French in origin. *See* M21.

Skit. A light satire, often in the form of parody.

Soliloquy. In a soliloquy a man talks to himself, or utters his thoughts aloud regardless of the presence of others who may hear him. The word is usually applied to such utterances by a character in a play. The most famous soliloquies in literature are those of Hamlet.

Sonnet. A lyric poem of fourteen lines, with an intricate rhyme scheme. *See* M18.

Squib. A brief, sharp satire (*q.v.*) attacking an individual.

Threnody. A term from the Greek, seldom used today. It means a song of mourning, especially a lament for the dead.

Tragedy. A play, or other literary work, which is preoccupied with the serious and unhappy aspects of life. It is sombre in tone and ends with misfortune. Shakespeare's "Macbeth" and Ibsen's "Ghosts" are typical tragedies.

Tragi-Comedy. The word is used in two different ways:

(*a*) It may denote a play (or very occasionally a story) which combines both tragic and comic elements. Chekhov's "The Cherry Orchard" is a tragi-comedy of this type.

(*b*) It may also mean a play which is for the most part sombre in theme and tone, but which has a happy conclusion, like Shakespeare's "The Winter's Tale."

Trilogy. In Greek literature a series of three tragedies, like Aeschylus' trilogy, the "Oresteia," written when he was nearly seventy, in the 5th century B.C. In modern times the word trilogy is applied to any sequence of three literary works which are related to each other in subject and theme.

Triolet. A single-stanza verse form, eight lines long, and with a very formal pattern, French in origin. *See* M20.

Villanelle. A poem of a strictly formal kind, French in origin. *See* M20.

V. LANGUAGES

The number of known, living languages exceeds 3,000, the great majority of which can be ascribed to about a dozen main language families. More than half the world's population of 3,356,000,000, however, can be reached by as few as 13 languages.

Languages are related in a distinct group if their ancestry can either be traced back to the same mother tongue or be inferred to derive from an assumed parent language (through comparative linguistic methods, historical records, etc.). The term "family" is used for the largest possible such grouping. Contrary to common belief related languages need not be alike phonetically or grammatically, nor need speakers of related languages have racial or cultural characteristics in common.

The scientific study of the structure and mechanics of language in general is the domain of *general linguistics*, various branches of which connect with other sciences, such as, for example, communication theory. *Comparative linguistics* denotes the study of the history and relationships of individual languages and language groups, and has connections therefore with social studies such as ethnology and historical geography. Modern linguistic study has developed from the study of comparative philology, which dates from the end of the 18th cent. It achieved greater scientific objectivity and exactitude in the last decades of the 19th cent., since when the term *philology* has reverted to its original significance, denoting the study chiefly of written texts: its connections lie therefore rather with literary history and criticism.

Chinese has the greatest number of speakers, followed by English, Hindi, Russian, Spanish, Japanese, German, French, Italian, Malay, Bengali, and Portuguese.

The oldest recorded language is Sumerian, which was spoken by a non-Semitic people who lived in the southern part of ancient Mesopotamia, *c.* 3,500 B.C. It was a language conveyed in cuneiform script with a structure and vocabulary unrelated to any other known language. It lost ground to the Akkadian Semitic language and began to die out in Hammurabi's time.

The oldest living language is Chinese, with a progressive history of 4,000 years during which it has maintained its identity and given shape to ideas. It is not phonetic, *i.e.*, it is not written in groups of letters which represent sounds, but each word is represented as a character. Coptic, a direct descendant of the ancient Egyptian language, has also survived but only as the liturgical language of the Christian Coptic Church. (Modern Egyptian is a dialect of Arabic.)

In grammar and phonetics, the most complex languages are those of the Caucasus, together with North American Indian tongues (including Eskimo), while the simplest is said to be Malay. The native languages of Britain, besides English, are Welsh (with an unbroken literary history since the 6th cent. A.D.), Irish Gaelic (the native tongue of Ireland with a literary history dating back to the 9th cent. A.D.), and Scots Gaelic (which became separate from Irish Gaelic in the 13th cent., though for literary purposes classical (Irish) Gaelic was employed in Scotland until the 18th cent.). Manx Gaelic is on the point of extinction. Cornish survived until the 18th cent.

A *lingua franca* is a language which acts as a medium of communication over a large multilingual area, such as Hindi in India, Swahili in southern Africa, Malay in the southwestern Pacific areas.

A *hybrid* language arises when foreign speakers adopt the basic vocabulary of a second language, usually as a commercial medium, and adapt it to their own phonetic and grammatical patterns: *Pidgin English* is English–Cantonese, *Beach-la-Mar* is English–Polynesian, *Papiamento* is Negro-Spanish of Curaçao.

An *artificial* language is one that has been deliberately constructed to act as a universal medium of communication; the best known is Esperanto.

A *standard* language is one recognised by a state as its national language and used for administration, national communications (*e.g.*, radio), and education. It may be one of several languages actually spoken in a particular country; or a particular form or dialect in a state where dialectal differences are acute, *e.g.*, standard Italian is the Tuscan dialect; or a purely written standard, *e.g.*, most Arabic-speaking nations, despite vernacular dialectal differences, employ classical Arabic in books and newspapers. A standard language thus tends to act as a *lingua franca*.

Nine major language-families and 11 major individual languages are listed below:

African Languages. Two linguistic pictures of Africa could be drawn, one showing the native languages and dialects, the other showing a patchwork cover of European languages of colonisation; yet neither would be complete without the other, for the two groups are everywhere in close contact. Many states recognise two or more official languages, both native and colonial in origin.

The principal colonial languages are French, English, Spanish, Portuguese, Italian, German, and Flemish. Dutch is of particular interest, since it has developed into what is virtually a new language, Afrikaans, the standard form of which differs in many respects from the European Dutch standard.

The native languages of North Africa, and of East Africa down to the equator, belong to the Semito-Hamitic family (*q.v.*). The true Negro-African languages number many hundreds, with a profusion of dialects. The southern half of the continent is almost exclusively the domain of the Bantu languages. Of these, the chief representative is Swahili: it boasts a considerable body of

literature, has long had currency as a medium of trade and commerce, and is fast thriving as a native *lingua franca* over the whole region. It may have as many as 10 million speakers. The Khoin, or Bushman–Hottentot languages, are spoken in parts of Angola, South West Africa and Botswana. The remaining languages, from Senegal to the Sudan, are roughly described as Sudanic, but they have not been satisfactorily classified and probably include many separate language families. The most significant of these is Hausa: originating in northern Nigeria, it has become, like Swahili in the south, an extensive *lingua franca*, with some 15 million speakers.

Altaic. A family of languages extending from Turkey to Mongolia and to northern Siberia, consisting of three main groups: (1) the Turkic languages, the most important member being Turkish, with about 26 million speakers; (2) Mongolian; (3) Tungusic languages of northern Asia, chiefly represented by the Manchu literary language.

Arabic. The language has a great history—as the evangelising medium of Islam, as the vehicle of a rich imaginative literature, and as the repository of science and philosophy during Europe's "dark ages." Spoken by some 75 million inhabitants of countries south and east of the Mediterranean, it remains one of the great languages of the present day. Countries in which it occupies official status include Algeria, Iraq, Israel, Jordan, Kuwait, Lebanon, Libya, Morocco, Saudi Arabia, Syria, and the United Arab Republic. *See also* Semito-Hamitic.

Austro-Asiatic. Family of languages in southern Asia. They include (1) the Mon-Khmer languages, chief representative Cambodian or Khmer, and (2) the Munda or Kolarian languages of Bihar and Orissa in north-east India. Some linguists ascribe to this group the Annamese and Mu'ong languages of Vietnam.

Chinese. As the national language of China's estimated 710 million inhabitants, Chinese is spoken by over twice the number who speak English, the second most widely spoken language in the world. Unlike India, China is not divided linguistically except in the south-eastern maritime provinces where several differing and mutually unintelligible dialects are found, including Cantonese, Wu, Min, and Hakka. In most of the rest of the country the language known in the West as Mandarin is spoken.

Mandarin, as spoken in Peking, is now the standard form of Chinese. This national language is called *p'u-t'ung-hua* (common speech). Mandarin is also the official standard of Taiwan, although the local dialect is Amoy, a variety of Min. The majority of the Chinese people who have settled in the United Kingdom speak Cantonese.

The traditional Chinese script is ideographic, *i.e.*, each character represents the meaning of a word, not its pronunciation, so that speakers of otherwise divergent dialects have always been able to follow the written language. The Chinese Government have recently introduced a system of romanisation, a language reform which will facilitate writing and printing through the replacement of the 4,000 essential characters by the relatively few letters of the Roman alphabet. Chinese has an attested history of over 4,000 years. *See also* Sinitic.

Dravidian. Family of languages found in southern India. Chief representatives: Telugu (spoken by some 35 million in Andhra Pradesh), Tamil (over 30 million in Madras and eastern Ceylon), Canarese or Kannada (16 million in Mysore) and Malayalam (15 million in Kerala). These are the only four Dravidian languages officially recognised in the Indian Union (*see* Indian languages). They are written in native alphabets which, while ultimately related to the Devanagari script, are so modified as to appear totally different. Tamil and Canarese are well established literary languages.

English. The English language belongs to the Germanic branch of the great Indo-European family of languages. Its closest relatives are Frisian and Dutch. It originated in the various Saxon dialects carried across by invaders during the 4th and 5th cent. A.D. Old English, as it is now known, was essentially a spoken language, but with the rise of Christianity and the influence of Latin writers, it emerged as a literary language. Other influences came from Scandinavian sources (Viking invasions) and French (Norman conquest). Modern English dates from the emergence of Mercian as the dominant dialect during the 14th century. As the major language, through former colonisation of countries in all five continents, and as a world-wide cultural, scientific, and commercial medium, English may have up to 300 million speakers.

French. The official language of France's 48 million inhabitants. It is also one of the two official languages of Belgium (spoken mainly in Brussels and the south by less than 2 million), and one of the three official languages of Switzerland, with over 1 million speakers in the western cantons (Geneva, Neuchatel, Fribourg, Valais, Vaud). With French-speaking peoples in many parts of the world, in Canada (Quebec and Ontario) and in countries belonging to the French Community, it may have a total of 80 million speakers. Its derivation from Latin classes it as a Romance language, and it is thus related to Portuguese, Spanish, Italian and Rumanian.

German. The language spoken by over 75 million people in East and West Germany, by 7 million in Austria, and as an official language of Switzerland, by nearly 4 million in 19 of the 25 cantons. In addition there are German-speaking peoples in Hungary, Czechoslovakia, Poland, and other smaller areas of Europe, and in former colonial regions (in Africa and some of the Pacific islands), bringing the total to between 95 and 100 million. The standard, High German, is distinct from the Low German or *Plattdeutsch* colloquial dialects spoken in the lowlands of northern Germany. German and English are the chief representatives of the Germanic group of languages, which also include Dutch and the Scandinavian languages.

Hindi. The official language of India, as laid down in the 1950 Constitution. English also continued as the official language until 1965 and under the Official Language Act, 1963, may still be used in addition to Hindi. Technically, Hindi

denotes a group of dialects of which Hindustani is the principal member. It is written in the Devanagari script, but has a variant Urdu, written in Arabic script and considerably influenced by Arabic and Persian vocabularies. There are close on 170 million speakers of Hindi/Urdu. The necessity of establishing an official medium was emphasised by the fact that, according to the 1961 census, the number of languages and dialects spoken in India amounted to 1,652. Hindi is an Indo-Aryan language of the Indo-European family related to Persian and more distantly to the majority of European languages. It is a modern descendant of Sanskrit, the literary language of the Vedic scriptures.

Urdu and Bengali are the two state languages of Pakistan. English continues to be the official language until 1970.

Indian Languages. *See* **Hindi, Indo-European, Dravidian, Austro-Asiatic.**

Indo-European. Most of the languages of Europe and of a large part of southwestern Asia belong to the Indo-European family. The notable exceptions are Hungarian, Basque, Finnish, Lappish, Turkish, and the Caucasian languages. The major branches and languages are: Germanic (English, German, Dutch, Flemish, Danish, Swedish, Norwegian, Icelandic), Romance (French, Portuguese, Spanish, Italian, Rumanian—all derived from Latin), Celtic (Gaelic, Welsh, Breton), Slavonic (Russian, Polish, Czech, Serbo-Croat, Bulgarian), Baltic (Lithuanian, Latvian), Greek, Albanian, Armenian, Iranian (Persian, Afghan) and Indo-Aryan (Hindi, Rajasthani, Punjabi, Bengali).

Italian. The official language of Italy's 50 million people, and spoken by about half a million in the Ticino canton of Switzerland. With emigrant speakers exceeding 10 million, and as a language of former colonisation in Africa (principally in Libya and Ethiopia), the language is probably spoken by as many as 65 million. Italian is the most direct descendant of Latin and is thus related to French and Spanish.

Japanese. The language spoken by Japan's 95 million people and by some speakers in Korea and Hawaii. Known from the 5th cent. A.D., it has been considerably influenced throughout its history by Chinese, both in speech and script. Nevertheless, it differs markedly in structure and vocabulary from its neighbour, and is more likely to be related to Korean, although such a relationship has not been proved.

Malayo-Polynesian. Family of languages native to the southwestern Pacific area, with the following groups: Indonesian (including Malay, Javanese, Tagalog, and Malagasy, totalling over 120 million speakers), Melanesian (which includes Austromelanesian and Micronesian languages, with just over 1 million speakers), and Polynesian (including Tahitian, Hawaiian, Maori, totalling less than half a million). Malay, with over 65 million speakers, is the official language of Indonesia, and is widespread as a *lingua franca* throughout the eastern archipelago. In Indonesia it is called *Bahasa Indonesia.*

Palaeo-Siberian. Family of languages, now considerably on the decline, spoken in northeastern Siberia and including Chukchee, Koryak, and Gilyak. Ainu, of the southern Sakhalin, may belong to this group, which shows some similarities to native languages of North America.

Russian. The major language of the U.S.S.R. is the mother tongue of over 80 per cent of the R.S.F.S.R.'s 125 million inhabitants. It is the official language throughout the Soviet Union, and, as such, is extensively propagated at all levels of education, although the native languages of most minority groups are also legally recognised. Discounting Byelo-Russian and Ukrainian, which are distinct languages, speakers of Russian number at least 160 million. Russian proper may be said to date from the 11th cent. The standard is Muscovite, and the language is written in Cyrillic script.

Semito-Hamitic. Family of languages chiefly represented by Arabic. Hamitic includes the Berber languages of desert nomads of northern Africa, and the Cushitic tongues of coastal Ethiopia and Somalia (the ancient Egyptian language was also a member of this group). The Semitic languages include Arabic (*q.v.*), Hebrew (official language of Israel and widely used by Jews all over the world), and Amharic (the official language of Ethiopia, spoken by some 5 million). Aramaic, the language spoken by Christ, is still spoken in parts of West Syria.

Akkadian, one of the oldest recorded languages and current throughout the Babylonian Empire, was spoken by the Semitic people who came to Mesopotamia *c.* 2,500 B.C. from the Arabian peninsula. They took over the cuneiform script of the non-Semitic Sumerians, although the two languages had no affinities. Akkadian was gradually replaced by the Aramaic language and alphabet.

Most of the Semitic languages have proved important languages of civilisation during their history, and have a rich literature.

Sinitic. Family of languages of southwestern Asia. The main languages and groups are: Chinese (*q.v.*), Tibetan-Burmese, and Thai. The last-named includes Siamese and Laotian. These and other languages of Thailand are very similar to one another, but the official language is Lao (Laotian). The Annamese language of Vietnam may also belong to the Thai group.

Spanish. The official language of Spain and of the South American states (except Brazil, Guyana, Surinam, French Guiana) and widespread as a former colonial medium and an important language of trade, with a total of at least 115 million speakers. Modern Spanish may be said to date from the 10th cent. It is very closely related to Portuguese (Portugal, Brazil, and colonial territories).

Uralian. Family of languages including Finnish (a million speakers), Hungarian (over 10 million), Lappish (30,000, mainly nomadic) and Samoyedic languages of the northern coastal regions of the U.S.S.R.

VI. FOREIGN PHRASES

Fr., French. Gr., Greek. Ger., German. It., Italian. L., Latin. Sp., Spanish.

à bas (Fr.), down, down with.
ab extra (L.), from without.
ab incunabilis (L.), from the cradle.
ab initio (L.), from the beginning.
ab intra (L.), from within.
à bon chat, bon rat (Fr.), to a good cat, a good rat; well attacked and defended; tit for tat; a Rowland for an Oliver.
à bon marché (Fr.), cheap, a good bargain.
à bras ouverts (Fr.), with open arms.
absente reo (L.), the accused being absent.
absit invidia (L.), let there be no ill-will; envy apart.
ab uno disce omnes (L.), from one specimen judge of all the rest; from a single instance infer the whole.
ab urbe conditâ (L.), from the building of the city: i.e., Rome.
a capite ad calcem (L.), from head to heel.
à chaque saint sa chandelle (Fr.), to each saint his candle; honour where honour is due.
à cheval (Fr.), on horseback.
à compte (Fr.), on account; in part payment.
à corps perdu (Fr.), with might and main.
à couvert (Fr.), under cover; protected; sheltered.
ad astra (L.), to the stars.
ad calendas Græcas (L.), at the Greek calends; *i.e.*, never, as the Greeks had no calends in their mode of reckoning.
à demi (Fr.), by halves; half-way.
a Deo et rege (L.), from God and the king.
ad hoc (L.), arranged for this purpose; special.
ad hominem (L.), to the man; to an individual's interests or passions; personal.
adhuc sub judice lis est (L.), the case has not yet been decided.
a die (L.), from that day.
ad infinitum (L.), to infinity
ad interim (L.), in the meantime.
ad libitum (L.), at pleasure.
ad modum (L.), after the manner of.
ad nauseam (L.), to disgust or satiety.
ad referendum (L.), for further consideration.
ad rem (L.), to the purpose; to the point.
ad valorem (L.), according to the value.
affaire d'amour (Fr.), a love affair.
affaire d'honneur (Fr.), an affair of honour; a duel.
affaire de cœur (Fr.), an affair of the heart.
a fortiori (L.), with stronger reason.
à gauche (Fr.), to the left.
à genoux (Fr.), on the knees.
à haute voix (Fr.), aloud.
à huis clos (Fr.), with closed doors; secretly.
à la belle étoile (Fr.), under the stars; in the open air.
à la bonne heure (Fr.), well timed; all right; very well; as you please.
à l'abri (Fr.), under shelter.
à la mode (Fr.), according to the custom or fashion.
à la Tartufe (Fr.), like Tartuffe, the hero of a celebrated comedy by Molière; hypocritically.
al fresco (It.), in the open air; out-of-doors.
al più (It.), at most.
alter ego (L.), another self.
à merveille (Fr.), to a wonder; marvellously.
amor patriæ (L.), love of country.
amour-propre (Fr.), self-love; vanity.
ancien régime (Fr.), the ancient or former order of things.
anguis in herba (L.), a snake in the grass.
anno Christi (L.), in the year of Christ.
anno Domini (L.), in the year of our Lord.
anno mundi (L.), in the year of the world.
annus mirabilis (L.), year of wonders; wonderful year.
ante bellum (L.), before the war.
ante lucem (L.), before light.
ante meridiem (L.), before noon.
à outrance (Fr.), to the utmost; to extremities; without sparing.
à pied (Fr.), on foot.
à point (Fr.), to a point, just in time, exactly right.
a posse ad esse (L.), from possibility to reality.
ariston metron (Gr.), the middle course is the best; the golden mean.
arrière-pensée (Fr.), hidden thought; mental reservation.
au courant (Fr.), fully acquainted with.
audi alteram partem (L.), hear the other side.
au fait (Fr.), well acquainted with; expert.
au fond (Fr.), at bottom.
auf Wiedersehen! (Ger.), till we meet again.
au pis aller (Fr.), at the worst.
au revoir (Fr.), adieu till we meet again.
aut vincere aut mori (L.), either to conquer or to die; death or victory.
a verbis ad verbera (L.), from words to blows.
a vinculo matrimonii (L.), from the bond of matrimony.
à volonté (Fr.), at pleasure.
a vostra salute (It.), *à votre santé* (Fr.), *a vuestra salud* (Sp.), to your health.
bas bleu (Fr.), a blue-stocking; a literary woman.
beau monde (Fr.), the world of fashion.
beaux esprits (Fr.), men of wit; gay spirits.
beaux yeux (Fr.), fine eyes; good looks.
ben trovato (It.), well or cleverly invented.
bête noire (Fr.), a black beast; a bugbear.
bon gré mal gré (Fr.), with good or ill grace; willing or unwilling.
bonhomie (Fr.), good-nature; artlessness.
bonne bouche (Fr.), a delicate or tasty morsel.
bon vivant (Fr.), a good liver; a gourmand.
brutum fulmen (L.), a harmless thunderbolt.
canaille (Fr.), rabble.
candida Pax (L.), white-robed Peace.
casus belli (L.), that which causes or justifies war.
causa sine qua non (L.), an indispensable cause or condition.
caveat emptor (L.), let the buyer beware (or look after his own interest).
cela va sans dire (Fr.), that goes without saying; needless to say.
ceteris paribus (L.), other things being equal.
chacun son goût (Fr.), every one to his taste.
cogito, ergo sum (L.), I think, therefore I exist.
comme il faut (Fr.), as it should be.
compos mentis (L.), sound of mind; quite sane.
compte rendu (Fr.), an account rendered; a report or statement drawn up.
conditio sine qua non (L.), a necessary condition.
conseil de famille (Fr.), a family consultation.
consensus facit legem (L.), consent makes the law.
consilio et animis (L.), by wisdom and courage.
consilio et prudentia (L.), by wisdom and prudence.
constantia et virtute (L.), by constancy and virtue.
contra bonos mores (L.), against good manners.
contretemps (Fr.), an unlucky accident; a hitch.
cordon bleu (Fr.), blue ribbon; a cook of the highest class.
cordon sanitaire (Fr.), a line of guards to prevent the spreading of contagion or pestilence.
corpus delicti (L.), the body or substance of a crime or offence.
corrigenda (L.), things to be corrected.
coup de grâce (Fr.), a finishing stroke.
coup d'état (Fr.), a sudden decisive blow in politics; a stroke of policy.
coup de soleil (Fr.), sunstroke.
credat Judæus Apella (L.), let Apella, the superstitious Jew, believe it (I won't); tell that to the marines.
cucullus non facit monachum (L.), the cowl does not make the friar.
cui bono? (L.), For whose advantage is it? to what end?
culpam pœna premit comes (L.), punishment follows hard upon crime.
cum grano salis (L.), with a grain of salt; with some allowance.
cum privilegio (L.), with privilege.
currente calamo (L.), with a fluent pen.
da locum melioribus (L.), give place to your betters.
damnant quod non intelligunt (L.), they condemn what they do not comprehend.
data et accepta (L.), expenditures and receipts.
de bon augure (Fr.), of good augury or omen.
de bonne grâce (Fr.), with good grace; willingly.

de die in diem (L.), from day to day.
de facto (L.), in point of fact; actual or actually.
dei gratia (L.), by God's grace.
de jure (L.), from the law; by right.
de mal en pis (Fr.), from bad to worse.
de novo (L.), anew.
deo volente (L.), God willing; by God's will.
de profundis (L.), out of the depths.
dernier ressort (Fr.), a last resource.
deus ex machina (L.), one who puts matters right at a critical moment; providential intervention.
dies non (L.), a day on which judges do not sit.
distingué (Fr.), distinguished; of genteel or elegant appearance.
dolce far niente (It.), sweet doing-nothing; sweet idleness.
double entente (Fr.), a double meaning; a play on words.
dramatis personæ (L.), characters of the drama or play.
dum spiro, spero (L.), while I breathe, I hope.
ecce homo! (L.), behold the man!
eheu! fugaces labuntur anni (L.), alas! the fleeting years glide by.
einmal ist keinmal (Ger.), just once doesn't count.
en avant (Fr.), forward.
en badinant (Fr.), in sport; in jest.
en déshabillé (Fr.), in undress.
en famille (Fr.), with one's family; in a domestic state.
enfant terrible (Fr.), a terrible child, or one that makes disconcerting remarks.
enfin (Fr.), in short; at last; finally.
en passant (Fr.), in passing; by the way.
en plein jour (Fr.), in broad day.
en rapport (Fr.), in harmony; in agreement; in relation.
en règle (Fr.), according to rules; in order.
entente cordiale (Fr.), cordial understanding, especially between two states.
entre nous (Fr.), between ourselves.
en vérité (Fr.), in truth; verily.
e pluribus unum (L.), one out of many; one composed of many.
esprit de corps (Fr.), the animating spirit of a collective body, as a regiment, learned profession or the like.
et sequentes, et sequentia (L.), and those that follow.
et tu, Brute! (L.), and thou also, Brutus!
ex animo (L.), heartily; sincerely.
ex capite (L.), from the head; from memory.
ex cathedra (L.), from the chair or seat of authority, with high authority.
exceptio probat regulam (L.), the exception proves the rule.
ex curia (L.), out of court.
ex dono (L.), by the gift.
exeunt omnes (L.), all go out or retire.
exit (L.), he goes out.
ex mero motu (L.), from his own impulse, from his own free will.
ex nihilo nihil fit (L.), out of nothing, nothing comes; nothing produces nothing.
ex officio (L.), in virtue of his office.
ex post facto (L.), after the deed is done; retrospective.
face à face (Fr.), face to face.
façon de parler (Fr.), manner of speaking.
faire bonne mine (Fr.), to put a good face upon the matter.
fait accompli (Fr.), a thing already done.

voilà (Fr.), behold; there is; there are.
voilà tout (Fr.), that's all.
volo, non valeo (L.), I am willing, but unable.
vox populi, vox Dei (L.), the voice of the people is the voice of God.

VII. ABBREVIATIONS IN COMMON USE

A

a. = area; acre(s); are (100 sq. metres).
A.A. = Automobile Association; Alcoholics Anonymous.
A.A.A. = Amateur Athletic Association.
A.A.C.C.A. = Associate of the Association of Certified and Corporate Accountants.
A.A.I. = Associate of the Chartered Auctioneers' and Estate Agents' Institute.
A.A.L.P.A. = Associate of the Incorporated Society of Auctioneers and Landed Property Agents.
A.B. = able-bodied seaman; *Artium Baccalaureus* (Bachelor of Arts).
A.B.A. = Amateur Boxing Association.
A.B.I.C.C. = Associate of the British Institute of Certified Carpenters.
ABM = anti-ballistics missile defence system.
Abp. = Archbishop.
abr. = abridged.
a.c. (*or* A.C.) = alternating current.
A.C.A. = Associate of the Institute of Chartered Accountants.
A.C.C.S. = Associate of the Corporation of Certified Secretaries.
A.C.I.S. = Associate of the Chartered Institute of Secretaries.
A.Comm.A. = Associate of the Society of Commercial Accountants.
A.C.P. = Associate of the College of Preceptors.
ACT = Advisory Council on Technology.
ACTH = adreno-cortico-trophic hormone.
A.C.W.A. = Associate of the Institute of Cost and Works Accountants.
A.D. = *anno domini* (in the year of our Lord).
A.D.C. = Aide-de-Camp.
Adm. = Admiral.
advt. (*or* adv.) = advertisement.
A.F.A.S. = Associate of the Faculty of Architects and Surveyors.
AEA = Atomic Energy Authority (UK).
AEC = Atomic Energy Commission (US).
AERE = Atomic Energy Research Establishment.
aet. (*or* aetat.) = *aetatis* (of age).
A.F.C. = Air Force Cross.
A.F.L. = American Federation of Labour.
A.F.M. = Air Force Medal.
A.G. = Adjutant-General.
AGR = Advanced Gas-cooled Reactor.
A.H. = *anno Hegirae* (in the year of the Hegira).
A.I.A. = Associate of the Institute of Actuaries.
A.I.A.C. = Associate of the Institute of Company Accountants.
A.I.B. = Associate of the Institute of Bankers.
A.I.B.P. = Associate of the Institute of British Photographers.
A.I.C.E. = Associate of the Institution of Civil Engineers.
A.I.C.S. = Associate of the Institute of Chartered Shipbrokers.
AID = Agency for International Development (U.S.).
A.I.I.A. = Associate of the Institute of Industrial Administration.
A.I.M.E. = Associate of the Institution of Mining Engineers.
A.I.Mech.E. = Associate of the Institution of Mechanical Engineers.
A.I.N.A. = Associate of the Institution of Naval Architects.
A.Inst.P. = Associate of the Institute of Physics.
A.I.R.I. = Associate of the Institution of Rubber Industry.
A.L.A. = Associate of the Library Association.
A.L.S. = Associate of the Linnean Society.
alt. = altitude.
A.M. = *anno mundi* (in the year of the world); *Artium Magister* (Master of Arts); amplitude modulation.
a.m. = *ante meridiem* (before noon).
A.M.D.G. = *ad majorem Dei glorium* (to the greater glory of God).
AMM = anti-missile-missile.
amp. = ampere(s).
A.M.I.C.E. = Associate Member of the Institution of Civil Engineers.
A.M.I.Chem.E. = Associate Member of the Institution of Chemical Engineers.
A.M.I.E.E. = Associate Member of the Institution of Electrical Engineers.
A.M.I.Mech.E. = Associate Member of the Institution of Mechanical Engineers.
A.M.I.Mun.E. = Associate Member of the Institution of Municipal Engineers.
A.M.T.P.I. = Associate Member of the Town Planning Institute.
ANC = African National Congress.
anc. = ancient.
ANF = Atlantic Nuclear Force.
anon. = anonymous.
ANZAC = Australian and New Zealand Army Corps.
ANZUS = Australian, New Zealand and U.S. Defence Pact (Pacific Security Treaty).
A.O.C. = Air Officer Commanding.
A.P. = Associated Press.
A.R.A. = Associate of the Royal Academy.
A.R.A.D. = Associate of the Royal Academy of Dancing.
[Music.
A.R.A.M. = Associate of the Royal Academy of
A.R.B.S. = Associate of the Royal Society of British Sculptors.
ARC = Agricultural Research Council.
A.R.C.A. = Associate of the Royal College of Arts.
[Music.
A.R.C.M. = Associate of the Royal College of
arch. = archipelago.
[Organists.
A.R.C.O. = Associate of the Royal College of
A.R.C.Sc. = Associate of the Royal College of Science.
A.R.I.B.A. = Associate of the Royal Institute of British Architects.
A.R.I.C. = Associate of the Royal Institute of Chemistry.
A.R.I.C.S. = Associate of the Royal Institution of Chartered Surveyors.
A.R.P.S. = Associate of the Royal Photographic Society.
A.R.W.S. = Associate of the Royal Society of Painters in Water Colours.
A.S. (*or* AS) = Anglo-Saxon.
A.S.A. = Amateur Swimming Association.
ASDIC = Anti-submarine detector indicator
ASEAN = Association of South-East Asian Nations (Indonesia, Malaysia, Philippines, Singapore, Thailand.)
ASLIB = Association of Special Libraries and Information Bureaux.
A.T.C. = Air Training Corps.
atm. = atmospheric pressure.
ATP = adenosine triphosphate.
A.T.S. = Auxiliary Territorial Service.
ATV = Associated Television Authority.
at.wt. = atomic weight.
A.U.C. = *ab urbe condita* (from the founding of the City (Rome)), *or*, *anno urbis conditae* (in the year of the founding of the City).
AV = Authorized Version.

B

b. = born; bowled.
B.A. = Bachelor of Arts.
B.A.A. = British Astronomical Association.
B.A.O. = Bachelor in the Art of Obstetrics.
BAOR = British Army of the Rhine.
B.Arch. = Bachelor of Architecture.
Bart. (*or* Bt.) = Baronet.
B.B. = Boys' Brigade.
B.B.C. = British Broadcasting Corporation.
B.C. = before Christ; British Columbia.
B.Ch. (*or* Ch.B.) = Bachelor in Surgery.
B.C.L. = Bachelor in Civil Law.
B.Com. = Bachelor of Commerce.
B.D. = Bachelor in Divinity.
B.D.A. = British Dental Association.
Bde. = Brigade.
B.D.S. (*or* B.Ch.D.) = Bachelor in Dental Surgery.
BEA = British European Airways Corporation.
B.E.C. = British Employers' Confederation.
B.Ed. = Bachelor of Education.
B.E.M. = British Empire Medal.
B.Eng. = Bachelor of Engineering.
BIM = British Institute of Management.

BIS = Bank for International Settlements.
BISRA = British Iron and Steel Research Association.
B.Litt. = Bachelor in Letters.
B.M. = Bachelor in Medicine; British Museum.
B.M.A. = British Medical Association.
B.M.C. = British Motor Corporation.
B.Mus. = Bachelor in Music.
B.N.C. = Brasenose College. Oxford.
BNEC = British National Export Council
BOAC = British Overseas Airways Corporation.
bor. = borough.
B.O.T. = Board of Trade.
Bp. = Bishop.
B.Phil. = Bachelor of Philosophy.
Br. (*or* Brit.) = British.
Brit.Ass. = British Association for the Advancement of Science.
B.R. = British Railways; British Rail.
B.R.B. = British Rail Board.
B.R.C.S. = British Red Cross Society.
B.R.S. = British Road Services.
B.Sc. = Bachelor of Science.
B.S.I. = British Standards Institution.
BST = British summer time.
Bt. = Baronet; Brevet.
B.T.H.A. = British Travel and Holidays Association.
B.Th. = Bachelor in Theology.
Btu = British thermal unit.
B.U.A. = British United Airways.
B.V.M. = Blessed Virgin Mary.
B.V.M.S. = Bachelor in Veterinary Medicine and Surgery.
B.W.B. = British Waterways Board.

C

C. = Centigrade; Conservative.
c. = *circa* (about); centi- (10^{-2}).
C.A. = Chartered Accountant (Scottish Institute).
Cal. = Calorie (nutritional kilogram-calorie).
cal. = calorie (gram-calorie used in physics and chemistry).
Cantab. = of Cambridge.
Cantuar. = of Canterbury.
cap. = capital letter; capitulum (chapter).
CARD = Campaign Against Racial Discrimination.
CATs = Colleges of Advanced Technology.
C.B. = Companion of the Order of the Bath.
C.B.E. = Commander of the Order of the British Empire.
CBI = Confederation of British Industry (replaces BEC, FBI and NABM).
C.C. = County Council; County Councillor; Chamber of Commerce.
c.c. (*or* cc.) = cubic centimetre(s).
CCPR = Central Council of Physical Recreation.
C.D. = Civil Defence.
C.D.C. = Commonwealth Development Corporation.
C.D.S. = Chief of Defence Staff; Campaign for Democratic Socialism.
CDU = Christian Democratic Union (W. Ger.).
C.E. = Civil Engineer; Christian Era.
CEGB = Central Electricity Generating Board.
CENTO = Central Treaty Organisation.
centi = one-hundreth part (10^{-2})
CERN = European Organisation for Nuclear Research.
C.F. = Chaplain to the Forces.
cf. = *confer* (compare).
C.G.M. = Conspicuous Gallantry Medal.
C.G.S. = Chief of General Staff.
cgs = centimetre-gram-second.
CGT = Confédération Générale du Travail (French TUC).
C.H. = Companion of Honour.
Ch.M. = Master in Surgery.
C.I. = Lady of Imperial Order of the Crown of India; Channel Islands.
CIA = Central Intelligence Agency (US).
CID = Criminal Investigation Department.
C.I.E. = Companion of the Order of the Indian Empire.
Cie = Compagnie (Company).
c.i.f. = cost, insurance and freight.
C.-in-C. = Commander-in-Chief.
CIO = Congress of Industrial Organisations (US).
C.L. = Companion of Literature.
C.L.B. = Church Lads' Brigade.
cm. = centimetre(s).
C.M.G. = Companion of the Order of St. Michael and St. George.
C.M.S. = Church Missionary Society.
CND = Campaign for Nuclear Disarmament.
C.O. = Commanding Officer; Colonial Office; Conscientious Objector.
Co. = County; Company.
c/o = care of.
C.O.D. = Cash on Delivery.
C. of E. = Church of England.
COI = Central Office of Information.
CoID = Council of Industrial Design.
COMECON = Council for Mutual Economic Assistance (East European).
Con. (*or* C.) = Conservative.
COSPAR = Committee on Space Research.
CP = Communist Party.
CPC = Communist Party of China.
C.P.R.E. = Council for the Preservation of Rural England.
CPSU = Communist Party of the Soviet Union.
C.R.O. = Commonwealth Relations Office.
C.S.C. = Conspicuous Service Cross.
C.S.E. = Certificate of Secondary Education.
C.S.I. = Companion of the Order of the Star of India.
CSP = Council on Scientific Policy.
C.T. = Civic Trust.
C.T.C. = Cyclists' Touring Club.
CTR = Controlled thermonuclear research.
cu. = cubic.
C.V.O. = Commander of the Royal Victorian Order.
cwt. = hundredweight.

D

d. = *denarius* (penny), *denarii* (pence); died; daughter.
D.A.R. = Daughters of the American Revolution.
dB = decibel(s).
D.C. = District of Columbia.
d.c. (*or* D.C.) = direct current.
D.C.L. = Doctor in Civil Law.
D.C.M. = Distinguished Conduct Medal.
D.D. = Doctor in Divinity.
D.D.R. = German Democratic Republic (E. Ger.).
D.D.S. = Doctor in Dental Surgery.
DDT = Dichloro-diphenyl-trichloro-ethane.
DEA = Department of Economic Affairs.
deca = ten times
deci = one-tenth (10^{-1})
del. = *delineavit* (he drew it).
D.ès L. = Docteur ès Lettres.
D.ès Sc. = Docteur ès Sciences.
D.F.C. = Distinguished Flying Cross.
D.F.M. = Distinguished Flying Medal.
D.G. = *dei gratia* (by the grace of God).
DIA = Design and Industries Association.
Dip.Tech. = Diploma in Technology.
D.L. = Deputy-Lieutenant.
D.Lit. (*or* D. Litt) = Doctor of Literature.
D.M. = Doctor in Medicine (Oxford).
DM = Deutschemark.
D.Mus. = Doctor of Music.
DNA = deoxyribonucleic acid.
D.N.B. = Dictionary of National Biography.
do. = *ditto* (the same).
D.O.M. = *dominus optimo maximo* (To God, the best, the greatest).
D.P. = Displaced Person(s).
D.P.H. = Diploma in Public Health.
D.Phil. = Dictor of Philosophy.
Dr. = Doctor; debtor.
dr. = drachm.
D.Sc. = Doctor of Science.
D.S.C. = Distinguished Service Cross.
DSIR = Department of Scientific and Industrial Research (to be abolished and replaced by SRC, IRDA, and NERC).
D.S.M. = Distinguished Service Medal.
D.S.O. = Companion of the Distinguished Service Order.
D.Th. = Doctor in Theology.
D.T.M. = Diploma in Tropical Medicine.
D.V. = *Deo volente* (God willing).
dwt. = pennyweight.

E

EAAFRO = East African Agriculture and Foresty Research.
E. and O.E. = Errors and omissions excepted.

Ebor. = of York.
EC = Electricity Council.
ECA = Economic Commission for Africa (UN).
ECAFE = Economic Commission for Asia and the Far East (UN).
ECE = Economic Commission for Europe (UN).
ECG = electro-cardiograph.
ECGD = Export Credits Guarantee Department.
ECLA = Economic Commission for Latin America (UN).
ECSC = European Coal and Steel Community.
EDC = European Defence Community.
EEC = European Economic Community (Common Market).
EEG = electro-encephalogram.
EFTA = European Free Trade Association.
e.g. = *exempli gratia* (for example).
ELDO = European Launcher and Development Organisation.
EMA = European Monetary Agreement.
EMBO = European Molecular Biology Organisation.
emf = electromotive force.
ENEA = European Nuclear Energy Agency.
EPU = European Political Union.
E.R. = Elizabetha Regina, *or* Edwardus Rex.
E.R.A. = Electrical Research Association.
ERNIE = electronic random number indicating equipment.
ERP = European Recovery Programme.
ESC = Economic and Social Council (UN).
ESRO = European Space Research Organisation.
et al. = *et alibi* (and elsewhere); *et alii* (and others).
etc. = *et cetera* (others; and so forth).
et seq. = *et sequens* (and the following).
et sqq. = *et sequentes, et sequentia* (and those following).
E.T.U. = Electrical Trades Union.
Euratom = European Atomic Energy Community.
ex lib. = *ex libris* (from the books of).

F

F. = Fahrenheit; Fellow.
f. = and the following page; ff. = and the following pages.
F.A. = Football Association.
F.A.C.C.A. = Fellow of the Association of Certified and Corporate Accountants.
F.A.I. = Fellow of the Chartered Auctioneers' and Estate Agents' Institute.
F.A.L.P.A. = Fellow of the Incorporated Society of Auctioneers and Landed Property Agents.
F.A.N.Y. = First Aid Nursing Yeomanry.
FAO = Food and Agriculture Organisation of the United Nations.
f.a.s. = free alongside.
F.B.A. = Fellow of the British Academy.
FBI = Federal Bureau of Investigation (U.S.).
F.B.I.M. = Fellow of the British Institute of Management.
F.B.O.A. = Fellow of the British Optical Association.
F.B.S. = Fellow of the Botanical Society.
F.C.A. = Fellow of the Institute of Chartered Accountants.
F.C.C.S. = Fellow of the Corporation of Secretaries.
F.C.I.S. = Fellow of the Chartered Institute of Secretaries.
F.C.P. = Fellow of the College of Preceptors.
F.C.W.A. = Fellow of the Chartered Institute of Cost and Works Accountants.
F.D. = *Fidei Defensor* (Defender of the Faith).
Fed. = Federation; Federal.
ff. = folios; and the following pages; fortissimo.
F.F.A.R.C.S. = Fellow of the Faculty of Anaesthetics, Royal College of Surgeons.
F.F.R. = Fellow of the Faculty of Radiologists.
F.G.S. = Fellow of the Geological Society.
F.H. = Fire Hydrant.
F.I.A. = Fellow of the Institute of Actuaries.
F.I.B. = Fellow of the Institute of Bankers.
F.I.B.P. = Fellow of the Institute of British Photographers.
F. Inst.F. = Fellow of the Institute of Fuel.
F.I.I.A. = Fellow of the Institute of Industrial Administration.
F.Inst.P. = Fellow of the Institute of Physics.
F.Inst.Pet. = Fellow of the Institute of Petroleum.
F.I.R.E. = Fellow of the Institute of Radio Engineers.
F.J.I. = Fellow of the Institute of Journalists.
F.K.C. = Fellow of King's College (London).
fl. = *floruit* (flourished).
F.L.A. = Fellow of the Library Association.
F.L.A.S. = Fellow of the Land Agents' Society.
F.L.N. = (Algerian) National Liberation Front.
F.L.S. = Fellow of the Linnean Society.
FM = Frequency modulation.
FMC = Federal Maritime Commission (US).
F.N.S. = Fellow of the Newtonian Society.
F.O. = Foreign Office.
fo. = folio.
f.o.b. = free on board.
F.O.P. = Friendship Oil Pipeline (E.Europe).
F.P.S. = Fellow of the Pharmaceutical Society.
F.Ph.S. = Fellow of the Philosophical Society.
F.R.A.D. = Fellow of the Royal Academy of Dancing.
F.R.A.I. = Fellow of the Royal Anthropological Institute.
F.R.A.M. = Fellow of the Royal Academy of Music.
F.R.A.S. = Fellow of the Royal Astronomical Society.
F.R.Ae.S. = Fellow of the Royal Aeronautical Society.
F.R.B.S. = Fellow of the Royal Society of British Sculptors.
F.R.C.M. = Fellow of the Royal College of Music.
F.R.C.O. = Fellow of the Royal College of Organists.
F.R.C.O.G. = Fellow of the Royal College of Obstetricians and Gynaecologists.
F.R.C.P. = Fellow of the Royal College of Physicians.
F.R.C.S. = Fellow of the Royal College of Surgeons.
F.R.C.V.S. = Fellow of the Royal College of Veterinary Surgeons.
F.R.E.S. = Fellow ot the Royal Empire Society.
F.R.Econ.S. = Fellow of the Royal Economic Society.
F.R.F.P.S. = Fellow of the Royal Faculty of Physicians and Surgeons (Glas.).
F.R.G.S. = Fellow of the Royal Geographical Society.
F.R.H.S. = Fellow of the Royal Horticultural Society.
F.R.Hist.S. = Fellow of the Royal Historical Society.
F.R.I.B.A. = Fellow of the Royal Institute of British Architects.
F.R.I.C. = Fellow of the Royal Institute of Chemistry.
F.R.I.C.S. = Fellow of the Royal Institution of Chartered Surveyors.
F.R.M.S. = Fellow of the Royal Microscopical Society.
F.R.Met.S. = Fellow of the Royal Meteorological Society.
F.R.P.S. = Fellow of the Royal Photographic Society.
F.R.S. = Fellow of the Royal Society.
F.R.S.A. = Fellow of the Royal Society of Arts.
F.R.S.C. = Fellow of the Royal Society of Canada.
F.R.S.E. = Fellow of the Royal Society of Edinburgh.
F.R.S.L. = Fellow of the Royal Society of Literature.
F.S.A. = Fellow of the Society of Antiquaries.
F.S.A.A. = Fellow of the Society of Incorporated Accountants and Auditors.
F.S.M.C. = Fellow of the Spectacle Makers Company.
F.S.S. = Fellow of the Statistical Society.
F.T.I. = Fellow of the Textile Institute.
F.Z.S. = Fellow of the Zoological Society.

G

g. = gram(s).
GATT = General Agreement on Tariffs and Trade.
G.B.E. = Knight (*or* Dame) Grand Cross of the Order of the British Empire.

G.C. = George Cross; Gas Council.
G.C.A. = Ground Control Approach.
G.C.E. = General Certificate of Education.
G.C.B. = Knight Grand Cross of the Order of the Bath.
G.C.I.E. = Knight Grand Commander of the Indian Empire.
G.C.M.G. = Knight Grand Cross of the Order of St. Michael and St. George.
G.C.S.I. = Knight Grand Commander of the Star of India.
G.C.V.O. = Knight (*or* Dame) Grand Cross of the Royal Victorian Order.
Gen. = General; Genesis.
GeV = thousand million electron-volts.
G.H.Q. = General Headquarters.
G.I. = American soldier (from army term "Government Issue" applied to kit and equipment).
GLC = Greater London Council.
G.M. = George Medal.
G.M.C. = General Medical Council.
G.M.T. = Greenwich mean time.
g.n.p. = gross national product.
G.O.C. = General Officer Commanding.
G.O.P. = Grand Old Party (US Republican Party).
G.P. = General Practitioner.
G.P.O. = General Post Office.
gr. = grain(s).
G.S.O. = General Staff Officer.

H

ha = hectare (100 ares).
H.E. = His Excellency; His Eminence; high explosive.
hecto = one hundred times (10^2).
H.H. = His (*or* Her) Highness.
hhd. = hogshead.
H.I.M. = His Imperial Majesty.
H.J.S. = *Hic jacet sepultus* (Here lies buried).
H.M. = His (*or* Her) Majesty.
H.M.I. = Her Majesty's Inspector.
H.M.S = Her Majesty's Ship; Her Majesty's Service.
H.M.S.O. = Her Majesty's Stationery Office.
H. of C. = House of Commons.
H. of L. = House of Lords.
Hon. = Honourable; Honorary.
hp = horsepower.
H.P. = Hire purchase.
H.R. = House of Representatives (US).
H.R.H. = His (*or* Her) Royal Highness.
H.S.E. = *Hic sepultus est* (Here lies buried).
H.T. = high tension.
H.V. = health visitor.
H.W.M. = high water mark.

I

IADB = Inter-American Development Bank.
IAEA = International Atomic Energy Agency (UN).
IATA = International Air Transport Association.
ib. (*or* ibid.) = *ibidem* (in the same place).
IBRD = International Bank for Reconstruction and Development (World Bank).
ICAO = International Civil Aviation Organisation (UN).
ICBM = Intercontinental ballistic missile.
ICFC = Industrial and Commercial Finance Corporation.
ICFTU = International Confederation of Free Trade Unions.
ICI = Imperial Chemical Industries.
ICJ = International Court of Justice (UN).
ICSU International Council of Scientific Unions.
ICT = International Computers and Tabulators.
ICY = International Co-operation Year (1965).
Id. = *idem* (the same).
IDA = International Development Association.
i.e. = *id est* (that is)
IFC = International Finance Corporation (UN).
Ign. = *ignotus* (unknown).
IGY = International Geophysical Year (1957–8).
IHS = *Iesus Hominum Salvator* (Jesus Saviour of men)—repr. a Greek abbrev. of the word Jesus.
ILEA = Inner London Education Authority.
ILO = International Labour Organisation (UN).
I.L.S. = Instrument Landing System.
IMCO = Inter-Governmental Maritime Consultative Organisation (UN).
IMF = International Monetary Fund (UN).
Inc. = Incorporated.
Incog. = *incognito* (unknown, unrecognised).
inf. = infinitive; *infra* (below).
I.N.R.I. = *Iesus Nazarenus, Rex Iudaeorum* (Jesus of Nazareth, King of the Jews).
Inst. = Institute; Institution.
inst. = instant (the present month).
Interpol = International Criminal Police Commission (HQ in Paris).
IOU = I owe you.
IQ = intelligence quotient.
IQSY = International Years of the Quiet Sun.
I.R. = Inland Revenue.
I.R.A. = Irish Republican Army.
IRBM = Intermediate-range ballistic missile.
IRC = International Red Cross.
IRDA = Industrial Research and Development Authority.
I.S.O. = Imperial Service Order; International Standardisation Organisation.
I.T.A. = Independent Television Authority; Institute of Travel Agents; Industrial Transport Association; Invalid Tricycle Association.
I.T.O. = International Trade Organisation.
I.T.U. = International Telecommunication Union.
ITV = Independent Television.

J

J. = Judge; Jet (aircraft).
J.P. = Justice of the Peace.

K

K. = Kelvin; Carat; Köchel numeration (of Mozart's works).
KANU = Kenya African National Union.
k = kilo = thousand.
K.B.E. = Knight Commander of the Order of the British Empire.
K.C. = King's Counsel.
kc. = kilocycle(s).
K.C.B. = Knight Commander of the Order of the Bath.
K.C.I.E. = Knight Commander of the Order of the Indian Empire.
K.C.M.G. = Knight Commander of the Order of St. Michael and St. George.
K.C.S.I. = Knight Commander of the Star of India.
K.C.V.O. = Knight Commander of the Royal Victorian Order.
K.G. = Knight of the Order of the Garter.
KGB = Soviet State Security Service.
kg = kilogram(s).
kilo = one thousand times (10^3).
KJV = King James Version.
K.K.K. = Ku Klux Klan.
km = kilometre(s).
K.P. = Knight of the Order of St. Patrick.
K.T. = Knight of the Order of the Thistle.
Kt. = knight.
kV = kilovolt(s).
kW = kilowatt(s).
kWh = kilowatt hour(s).

L

L. (*or* Lib.) = Liberal.
L.A. = Local Authority.
Lab. = Labour.
L.A.C. = London Athletic Club.
LAMDA = London Academy of Music and Dramatic Art.
lat. = latitude.
lb. = *libra* (pound), *librae* (pounds).
l.b.w. = leg before wicket.
l.c. = lower case (small letter(s)).
LCC = London County Council.
L.C.P. = Licentiate of the College of Preceptors.
L.D.S. = Licentiate in Dental Surgery.
L.ès L. = Licencié ès Lettres.
L.F.B. = London Fire Brigade.
L.H.D. = *Litterarum Humaniorum Doctor* (Doctor of Humane Letters).

Lic.Med. = Licentiate in Medicine.
Lic.S. = Licentiate in Surgery.
Lit.Hum. = *Literae Humaniores* (Study of the Classics).
Litt.D. = *Litterarum Doctor* (Doctor of Letters; Doctor in Letters (Camb.)).
LL.B. = *Legum Baccalaureus* (Bachelor of Laws).
LL.D. = *Legum Doctor* (Doctor of Laws; Doctor in Law (Camb.)).
L.M. = Licentiate in Midwifery.
loc.cit. = *loco citato* (in the place sited).
log. = logarithm.
long. = longitude.
L.R.A.D. = Licentiate of the Royal Academy of Dancing.
L.R.A.M. = Licentiate of the Royal Academy of [Music.
L.R.C.M. = Licentiate of the Royal College of Music.
L.R.C.P. = Licentiate of the Royal College of [Physicians.
L.R.C.S. = Licentiate of the Royal College of Surgeons.
L.R.C.V.S. = Licentiate of the Royal College of Veterinary Surgeons.
L.S. = *loco sigilli* (place of the seal).
L.S.A. = Licentiate of the Society of Apothecaries.
L.s.d. = *Librae, solidi, denarii* (Pounds, shillings, pence).
LSD = Lysergic acid diethylamide
L.S.E. = London School of Economics.
L.S.O. = London Symphony Orchestra.
L.T.A. = Lawn Tennis Association.
L.Th. = Licentiate in Theology.
Lt.-Gen. = Lieutenant-General.
L.W.M. = lower-water mark.
LXX = Septuagint.

M

M. = Member; Monsieur; mark (German coin); *meridies* (noon); mega (million times).
m. = metre(s); married; masculine; million.
M.A. = Master of Arts.
MAOT = Member of the Association of Occupational Therapists.
M.A.O. = Master in the Art of Obstetrics.
M.B. = Bachelor in Medicine.
M.B.A. = Master of Business Administration.
M.B.E. = Member of the Order of the British Empire.
M.C. = Military Cross; Master of Ceremonies.
Mc = million cycles, *or* megacycle.
M.C.C. = Marylebone Cricket Club.
M.Ch. = Master in Surgery.
M.Ch.D. = Master in Dental Surgery.
M.Ch.Orth. = Master in Orthopaedic Surgery.
M.Com. = Master of Commerce.
M.C.S.P. = Member of the Chartered Society of Physiotherapy.
M.C.T. = Member of the College of Technologists.
M.D. = *Medicineae Doctor* (Doctor in Medicine).
M.D.S. = Master in Dental Surgery.
M.E. = Middle English.
mega = one million times (10^6).
MeV = megaelectronvolt(s)
M.F.H. = Master of Foxhounds.
mg = milligram(s).
Mgr. = Monsignor.
MHD = magnetohydrodynamics.
micro = one-millionth part (10^{-6}).
M.I. = Military Intelligence.
M.I.C.E. = Member of the Institution of Civil Engineers.
M.I.Chem.E. = Member of the Institution of Chemical Engineers.
M.I.E.E. = Member of the Institution of Electrical Engineers.
milli = one-thousandth part (10^{-3}).
M.I.Mar.E. = Member of the Institute of Marine Engineers.
M.I.Mech.E. = Member of the Institution of Mechanical Engineers.
M.I.Min.E. = Member of the Institution of Mining Engineers.
M.I.N.A. = Member of the Institution of Naval Architects.
M.Inst.Met. = Member of the Institute of Metals.
Mintech = Ministry of Technology.
M.I.Mun.E. = Member of the Institution of Municipal Engineers.
M.Inst.T. = Member of the Institute of Trans- [port.
M.I.T. = Massachusetts Institute of Technology.
M.I.T.M.A. = Member of the Institute of Trade Mark Agents.
M.I.W.M. = Member of the Institution of Works Managers.
M.J.I. = Member of the Institute of Journalists.
MKS = metre-kilogram-second system
MKSA = metre-kilogram-second-ampere (Giorgi)
MLF = Multilateral Force.
Mlle = Mademoiselle.
MM. = Messieurs.
mm = millimetre(s).
Mme = Madame.
mmHg = millimetre(s) of mercury.
Mods. = Moderations (Oxford).
M.O.H. = Medical Officer of Health; Ministry of Health.
M.P. = Member of Parliament; Military Police.
m.p.h. = miles per hour.
M.P.S. = Member of the Pharmaceutical Society; Member of the Philological Society; Member of the Physical Society.
M.R. = Master of the Rolls.
M.R.A.S. = Member of the Royal Asiatic Society; Member of the Royal Academy of Science.
M.R.Ae.S. = Member of the Royal Aeronautical Society.
M.R.C. = Medical Research Council.
M.R.C.P. = Member of the Royal College of Physicians.
M.R.C.P.(E.) = Member of the Royal College of Physicians (Edinburgh).
M.R.C.S. = Member of the Royal College of [Surgeons.
M.R.C.V.S. = Member of the Royal College of Veterinary Surgeons.
M.R.I. = Member of the Royal Institution.
M.S. = Master in Surgery.
Ms., Mss. = Manuscript, Manuscripts.
M.S.A. = Mutual Security Agency.
M.Sc. = Master of Science.
M.T.B. = Motor Torpedo Boat.
M.T.P.I. = Member of the Town Planning Insti- [tute.
Mus.B. = *Musicae Baccalaureus* (Bachelor in Music).
Mus.D. = *Musicae Doctor* (Doctor in Music).
MV = million volts *or* megavolt.
M.V.O. = Member of the Royal Victorian Order.
MW = million watts *or* megawatt.
M.W.B. = Metropolitan Water Board.

N

NAAFI = Navy, Army and Air Force Institutes.
N.A.B.M. = National Association of British Manufacturers.
nano = one-thousand-millionth part (10^{-9})
NASA = National Aeronautics and Space Administration (US).
NATO = North Atlantic Treaty Organisation.
NATSOPA = National Society of Operative Printers and Assistants.
N.B. = *nota bene* (note well).
NBS = National Bureau of Standards (US).
N.C. = Nature Conservancy.
N.C.B. = National Coal Board.
N.C.L.C. = National Council of Labour Colleges.
N.C.O. = Non-commissioned Officer.
N.C.U. = National Cyclists' Union.
n.d. = no date (of books).
NEDC = National Economic Development Council.
Nem.con. = *Nemine contradicente* (no one contradicting = unanimously).
Nem.diss. = *Nemine dissentiente* (no one dissenting = unanimously).
NERC = Natural Environment Research Council.
Net. (*or* Nett.) = free from, or not subject to, any deductions.
NHS = National Health Service.
NIBMAR = no independence before majority African rule.
NIC = National Incomes Commission.
NIRNS = National Institute for Research in Nuclear Science.
NLL = National Lending Library for Science and Technology.
No. = *numero* (number).
N.P. = Notary Public.
N.P.C. = National Parks Commission.
NPD = National Democratic Party (W. Ger.).
N.P.F.A. = National Playing Fields Association.
NPL = National Physical Laboratory.

NRDC = National Research Development Corporation.
N.S. = New Style in the calendar (in Gt. Britain since 1752).
N.S.P.C.C. = National Society for the Prevention of Cruelty to Children.
N.T. = New Testament; National Trust.
N.U.R. = National Union of Railwaymen.
N.U.T. = National Union of Teachers.
N.Y. = New York.
N.Z. = New Zealand.

O

OAS = Organisation of American States; Organisation de l'Armée Secrète (the clandestine army of the French colonists in Algeria).
OAU = Organisation of African Unity.
ob. = *obit* (died).
O.B.E. = Officer of the Order of the British Empire.
OCAM = Joint African and Malagasy Organisation
OCTU = Officer Cadets' Training Unit.
ODECA = Organisation of Central American States.
OECD = Organisation for Economic Co-operation and Development.
O.E.D. = Oxford English Dictionary.
O.F.M. = *Ordo Fratrum Minorum* (Order of Friars Minor = Franciscan).
O.H.M.S. = On Her Majesty's Service.
O.M. = Member of the Order of Merit.
O.P. = *Ordinis Praedicatorum* (Order of Preachers = Dominicans); opposite to prompter (stage term); out of print.
op. = *opus* (work).
op cit. = *opere citato* (in the work cited).
ORC = Overseas Research Council.
ORGEL = Organique et Eau Lourde (organic liquid and heavy water nuclear reactor).
O.S. = Old Style in calendar.
O.S.B. = *Ordo Sancti Benedicti* (Order of St. Benedict = Benedictines).
O.T. = Old Testament.
O.T.C. = Officers' Training Corps.
Oxon. = of Oxford.
oz. = ounce(s).

P

P.A. = Press Association.
PAYE = Pay as you earn (income tax scheme).
P.C. = Privy Councillor; Police Constable.
P.C.C. = People's Caretakers' Council (Nat. movement in Rhodesia).
p.c. = per cent.; postcard.
P.D.S.A. = People's Dispensary for Sick Animals.
P.E.N. = Poets, Playwrights, Essayists, Editors and Novelists (Club).
P.E.P. = Political and Economic Planning (Society).
per pro (*or* p.p.) = *per procurationem* (by proxy).
Ph.D. = *Philosophiae Doctor* (Doctor of Philosophy).
pinx = *pinxit* (he painted).
P.L.A. = Port of London Authority.
PLUTO = Pipe-line under the ocean.
P.M. = Prime Minister; Post master; *post meridiem* (afternoon).
P.M.G. = Postmaster General.
P.M.O. = Principal Medical Officer.
P.N.E.U. = Parents' National Education Union.
P.O. = Post Office; postal order; Petty Officer.
P. & O. = Peninsular and Oriental Steamship Co.
P.O.W. = prisoner of war.
pp. = pages.
P.P.C. = pour prendre congé (to take leave).
P.Q. = Parliamentary Question.
P.P.S. = Parliamentary Private Secretary.
P.R. = Proportional Representation.
P.R.A. = President of the Royal Academy.
P.R.B. = Pre-Raphaelite Brotherhood.
Pro tem. = *pro tempore* (for the time being).
Prox = *proximo* (of the next month).
P.R.S. = President of the Royal Society.
P.S. = *post scriptum* (postscript).
Ps. = Psalm.
Pss. = Psalms.
P.T. = Physical Training.
Pte. = Private.
P.T.O. = please turn over.

Q

Q. = Queen.
Q = 10^{18} British Thermal Units ($1{\cdot}05 \times 10^{21}$ joules).
Q.B. = Queen's Bench.
Q.C. = Queen's Counsel.
Q.E.D. = *quod erat demonstrandum* (which was to be demonstrated).
Q.E.F. = *quod erat faciendum* (which was to be done).
Q.E.I. = *quod erat inveniendum* (which was to be found).
q.l. (*or* q.pl) = *quantum libet* (*or quantum placet*) (as much as one pleases).
Q.M. = Quartermaster.
Q.M.C. = Queen Mary College.
q.s. = *quantum sufficit* (a sufficient quantity).
QSEs = Qualified skills and engineers.
QSSs = Quasars (quasi stellar radio sources).
Q.T. = quiet (slang).
Qto. = quarto (folded in four).
q.v. = *quod vide* (which see).

R

R. = Réaumur; *Rex* (King); *Regina* (Queen); Right (stage direction).
R.A. = Rear Admiral; Royal Academy; Royal Academician; Research Association; Right Ascension (astron.).
R.A.C. = Royal Automobile Club.
R.Ae.S. = Royal Aeronautical Society.
R.A.E. = Royal Aircraft Establishment.
R.A.F. = Royal Air Force.
R.A.M. = Royal Academy of Music.
R.C. = Red Cross; Roman Catholic.
R.D. = Rural Dean; Royal Naval Reserve Decoration; Refer to Drawer.
R.D.C. = Rural District Council
R.D.I. = Designer for Industry of the Royal Society of Arts.
R.E. = Royal Engineers.
Reg. Prof. = Regius Professor.
R.E.M.E. = Royal Electrical and Mechanical Engineers.
Rep. = Representative; Republican.
R.G.S. = Royal Geographical Society.
R.H.S. = Royal Humane Society; Royal Horticultural Society.
R.Hist.S. = Royal Historical Society.
R.I. = Royal Institution; Royal Institute of Painters in Water Colours; Rhode Island; Religious Instruction.
R.I.B.A. = Royal Institution of British Architects.
R.I.I.A. = Royal Institute of International Affairs (Chatham House, London).
R.I.P. = *requiescat in pace* (may he rest in peace).
R.L.O. = Returned Letter Office.
R.M. = Royal Marines; Resident Magistrate.
R.M.C. = Royal Military College, Sandhurst.
R.N. = Royal Navy.
RNA = ribonucleic acid.
R.N.L.I. = Royal National Lifeboat Institution.
Ro. = *recto* (on the right-hand page).
R.P. = Member of the Royal Society of Portrait Painters.
rpm = revolutions per minute.
R.S.A. = Royal Society of Arts; Royal Scottish Academician.
R.S.M. = Regimental Sergeant Major.
R.S.P.C.A. = Royal Society for the Prevention of Cruelty to Animals.
R.S.V.P. = *Répondez, s'il vous plaît* (An answer is requested).
R.S.W. = Royal Scottish Society of Painters in Water Colours.
Rt. Hon. = Right Honourable.
Rt. Rev. = Right Reverend (of a Bishop).
R.U. = Rugby Union.
RV = Revised Version.
R.W.S. = Royal Society of Painters in Water Colours.
R.Y.S. = Royal Yacht Squadron.

S

S. = *San, Santa, Santo,* or *São* (Saint); SS. = Saints.
s. = *solidus* (shilling), *solidi* (shillings).

S.A. = Salvation Army; Sex Appeal; South America; South Australia; South Africa; Société Anonyme (Limited).
SACEUR = Supreme Allied Commander Europe.
SACLANT = Supreme Allied Commander Atlantic.
Sarum = of Salisbury.
S.C. = qualified to admission to Staff College.
sc. = *scilicet* (namely).
Sc.D. = *Scientiae Doctor* (Doctor in Science).
S.C.F. = Senior Chaplain to the Forces.
S.C.M. = State Certified Midwife; Student Christian Movement.
SEATO = South-East Asia Treaty Organisation.
S.G. = Solicitor-General; Scots Guards.
SHAPE = Supreme Headquarters, Allied Powers, Europe.
SI = Système International d'Unités (International System of Units).
sic. = so written.
SINS = Ships Inertial Navigation System.
SISTER = Special Institution for Scientific and Technical Education and Research.
SOS = distress signal (wireless code signal, used especially by ships at sea).
s.p. = *sine prole* (without issue).
S.P.C.K. = Society for the Promotion of Christian Knowledge.
SPD = Social Democratic Party (W. Ger.).
S.P.G. = Society for the Propagation of the Gospel.
sp. gr. = specific gravity.
sq. = square; *sequens* (the following).
sqq. = *sequentes, sequentia* (those following).
SRC = Science Research Council.
S.R.N. = State Registered Nurse.
SS. = Saints.
S.S. = Steamship.
S.S.C. = Solicitor before Supreme Court (Scotland).
S.T.D. = *Sacrae Theologiae Doctor* (Doctor of Theology); Subscriber Trunk Dialling.
St. = Saint; Street.
Ste = *Sainte* (Saint, feminine).
Stet = Let it stand (printing term).
S.T.P. = *Sacrae Theologiae Professor* (Professor of Divinity, old form of D.D.)
s.v. = *sub verbo* (under the entry).

T

TAB = Technical Assistance Board (UN).
T.B. = Tubercule bacillus (tuberculosis).
t.b. = torpedo boat.
T.C.D. = Trinity College, Dublin.
T.D. = Territorial Decoration; Tealta Dáil (Member of the Dáil).
T.F. = Territorial Force.
T.H. = Trinity House.
TNT = trinitrotoluene (high explosive).
Toc.H. = Talbot House.
tr. = transpose.
T.R.C. = Thames Rowing Club; Tithes Rent Charge.
T.T. = tubercular tested; teetotal.
TUC = Trades Union Congress.
TV = Television.
TVA = Tennessee Valley Authority.
T.V.W.B. = Thames Valley Water Board.
TWI = Training Within Industry for Supervisors.
T.Y.C. = Thames Yacht Club; Two-year Old (*or* Thousand Yards) Course.

U

U.A.M. = Afro-Malagasy Union.
U-boat = German submarine.
UAR = United Arab Republic.
UCL = University College, London.
U.D.C. = Urban District Council.
UDEAC = Union douanière et economique de l'Afrique centrale.
UGC = University Grants Committee.
UHF = ultra-high frequency.
U.K. (*or* UK) = United Kingdom.
UKAEA = UK Atomic Energy Authority.
ult. = *ultimo* (of the last month).
U.N. (*or* UN) = United Nations.
UNCTAD = United Conference on Trade and Development (UN).
UNEF = United Nations Emergency Force(s).
UNESCO = United Nations Education, Scientific, and Cultural Organisation.
UNICEF = United Nations Children's Fund.
UNRWA = United Nations Relief and Works Agency for Palestine Refugees.
U.P. = United Press.
U.P.U. = Universal Postal Union (UN).
U.S. (*or* US) United States.
U.S.A. (*or* USA) = United States of America.
USAEC = US Atomic Energy Commission.
U.S.S.R. (*or* USSR) = Union of Soviet Socialist Republics (Russia).

V

v. = *vide* (see); *versus* (against); volt(s).
V.A. = Vicar-Apostolic.

M.V.O. (5th); M.B.E.

Younger sons of the younger sons of Peers.

Baronets' younger sons.

Younger sons of Knights in order of their fathers.

Naval, Military, Air, and other Esquires by Office.

Women take the same rank as their husbands or as their eldest brothers; but the daughter of a Peer marrying a Commoner retains her title as Lady or Honourable. Daughters of Peers rank next immediately after the wives of their elder brothers, and before their younger brothers' wives. Daughters of Peers marrying Peers of lower degree take the same order of precedency as that of their husbands; thus the daughter of a Duke marrying a Baron becomes of the rank of Baroness only, while her sisters married to commoners retain their rank and take precedence of the Baroness. Merely official rank on the husband's part does not give any similar precedence to the wife. Dames Grand Cross (G.C.V.O. or G.B.E.) rank after wives of Baronets and before wives of Knights Grand Cross. Dames Commanders (D.C.V.O. or D.B.E.) rank after wives of Knights Grand Cross and before wives of Knights Commanders.

Precedence is formed by statute, patent, or usage, but the chief regulations regarding the order of precedence were settled by Parliament in the reign of Henry VIII.

Precedence locally, in county or city, has not been promulgated by written code, but in Counties the Lord Lieutenant stands first, and secondly the Sheriff, and therefore in Cities and Boroughs the Lord Lieutenant has social precedence over the Mayor; but at City or Borough functions the Lord Mayor or Mayor will preside. At Oxford and Cambridge the High Sheriff takes precedence of the Vice-Chancellor.

PRECEDENCE IN SCOTLAND

The Sovereign.

The Duke of Edinburgh.

The Lord High Commissioner to the General Assembly (while that Assembly is sitting).

The Duke of Rothesay (eldest son of the Sovereign).

Younger sons of the Sovereign.

Address: (Christian name and surname), Esq., H.B.M. Agent and Consul-General, *or* H.B.M. Consul-General, *or* H.B.M. Consul, *or* H.B.M. Vice-Consul.

GOVERNORS-GENERAL.
Begin: According to rank.
Address: His Excellency (ordinary designation), Governor of——.
Speak to as: Your Excellency.

PRIVY COUNCILLORS.
The courtesy title of "Right Honourable" is accorded all Privy Councillors (all members of the Cabinet are privy councillors, and the office is conferred for life). In the case of peers below the rank of Marquess, who already have a right to it in virtue of their peerage, the rank of Privy Councillor is indicated by the letters "P.C." after the name. Wives do not share the title.
Address: The Right Hon. ——.
Admiral the Right Hon. Sir ——.
The Right Rev. the Right Hon. the Lord Bishop of ——.
The Most Hon. the Marquess of ——, P.C.

BUSINESS LETTERS.
Business letters to persons of rank can either be written in the third person (grammatical pitfalls must be guarded against), in which case they are not signed, or in the first person plural.

Earl of Liverpool	Tory	1812–27
George Canning	Tory	1827
Viscount Goderich	Tory	1827
Duke of Wellington	Tory	1827–30
William IV, 1830–7		
Earl Grey	Whig	1830–4
Viscount Melbourne	Whig	1834
Sir Robert Peel	Tory	1834–5
Viscount Melbourne	Whig	1835–7
Victoria, 1837–1901		
Viscount Melbourne	Whig	1837–41
Sir Robert Peel	Tory	1841–6
Lord John Russell	Whig	1846–52
Earl of Derby	Tory	1852
Earl of Aberdeen	Peelite	1852–5
Viscount Palmerston	Liberal	1855–8
Earl of Derby	Tory	1858–9
Viscount Palmerston	Liberal	1859–65
Earl Russell	Liberal	1865–6
Earl of Derby	Conservative	1866–8
B. Disraeli	Conservative	1868
W. E. Gladstone	Liberal	1868–74
B. Disraeli	Conservative	1874–80
W. E. Gladstone	Liberal	1880–5
Marquis of Salisbury	Conservative	1885–6
W. E. Gladstone	Liberal	1886
Marquis of Salisbury	Conservative	1886–92
W. E. Gladstone	Liberal	1892–4
Earl of Rosebery	Liberal	1894–5
Marquis of Salisbury	Conservative	1895–1901
Edward VII, 1901–10		
Marquis of Salisbury	Conservative	1901–2
A. J. Balfour	Conservative	1902–5
Sir H. Campbell-Bannerman	Liberal	1905–8
H. H. Asquith	Liberal	
George V, 1910–36		
H. H. Asquith	Liberal	1910–15
H. H. Asquith	Coalition	1915–16
D. Lloyd George	Coalition	1916–22
A. Bonar Law	Conservative	1922–3
S. Baldwin	Conservative	1923–4
J. R. MacDonald	Labour	1924
S. Baldwin	Conservative	1924–9
J. R. MacDonald	Labour	1929–31
J. R. MacDonald	Coalition	1931–5
S. Baldwin	Coalition	1935–6
Edward VIII, 1936		
George VI, 1936–52		
S. Baldwin	Coalition	1936–7
N. Chamberlain	Coalition	1937–40
W. S. Churchill	Coalition	1940–5
W. S. Churchill	Conservative	1945
C. R. Attlee	Labour	1945–51
Sir W. S. Churchill	Conservative	1951–2
Elizabeth II, 1952–		
Sir W. S. Churchill	Conservative	1952–5
Sir A. Eden	Conservative	1955–7
H. Macmillan	Conservative	1957–63
Sir A. Douglas-Home	Conservative	1963–4
H. Wilson	Labour	1964–

PRESIDENTS OF THE UNITED STATES

The terms are for four years; only President F. D. Roosevelt has served more than two terms.

	Party	Served
1. George Washington	Fed.	1789–97
2. John Adams	Fed.	1797–1801
3. Thomas Jefferson	Rep.	1801–9
4. James Madison	Rep.	1809–17
5. James Monroe	Rep.	1817–25
6. John Quincey Adams	Rep.	1825–9
7. Andrew Jackson	Dem.	1829–37
8. Martin Van Buren	Dem.	1837–41
9. William H. Harrison (died in office)	Whig	1841
10. John Tyler	Whig	1841–5
11. James K. Polk	Dem.	1845–9
12. Zachary Taylor (died in office)	Whig	1849–50
13. Millard Fillmore	Whig	1850–3
14. Franklin Pierce	Dem.	1853–7
15. James Buchanan	Dem.	1857–61
16. Abraham Lincoln (assassinated)	Rep.	1861–5
17. Andrew Johnson	Rep.	1865–9
18. Ulysses S. Grant	Rep.	1869–77
19. Rutherford B. Hayes	Rep.	1877–81
20. James A. Garfield (assassinated)	Rep.	1881
21. Chester A. Arthur	Rep.	1881–5
22. Grover Cleveland	Dem.	1885–9
23. Benjamin Harrison	Rep.	1889–93
24. Grover Cleveland	Dem.	1893–7
25. William McKinley (assassinated)	Rep.	1897–1901
26. Theodore Roosevelt	Rep.	1901–9
27. William Howard Taft	Rep.	1909–13
28. Woodrow Wilson	Dem.	1913–21
29. Warren G. Harding (died in office)	Rep.	1921–3
30. Calvin Coolidge	Rep.	1923–9
31. Herbert C. Hoover	Rep.	1929–33
32. Franklin D. Roosevelt (died in office)	Dem.	1933–45
33. Harry S. Truman	Dem.	1945–53
34. Dwight D. Eisenhower	Rep.	1953–61
35. John F. Kennedy (assassinated)	Dem.	1961–3
36. Lyndon B. Johnson	Dem.	1963–

UNITED KINGDOM COINAGE

The Royal Mint is authorised to issue coins of the following denominations and specifications:—

Denomination.	Standard weight.
Gold:	Grains.
Five Pound Piece	616·37239
Two Pound Piece	246·54895
Sovereign	123·27447
Half Sovereign.	61·63723
Cupro-Nickel:	
Crown	436·36363
Half-Crown	218·18181
Florin	174·54545
Shilling	87·27272
Sixpence	43·63636
Silver:	
Maundy Fourpence . . .	29·09090
Maundy Threepence . . .	21·81818
Maundy Twopence . . .	14·54545
Maundy Penny	7·27272
Nickel Brass:	
Threepence	105·00000
Bronze:	
Penny	145·83333
Halfpenny	87·50000

Gold Coinage in Britain consists of eleven-twelfths of fine metal and one-twelfth of alloy: millesimal fineness 916·6. Two hundred and forty troy ounces of standard gold are coined into 934 sovereigns and one half-sovereign: one troy ounce is, therefore, worth £3 17*s.* 10½*d.*, and one ounce of pure gold is nominally worth £4 4*s.* 11½*d.* The minimum weight at which a sovereign is allowed to remain current unchallenged is 122½ grains: that of half-a-sovereign 61⅛ grains. Under the Exchange Control laws it is illegal for a resident in the U.K. to hold gold coin other than collectors' pieces, and collectors must apply for official permission if their collection contains more than four gold coins. A new collector must obtain permission to hold even one such coin.

Cupro-Nickel. The first change in the silver standard since the reign of Queen Elizabeth was made in 1920, when the degree of fineness was reduced to 500 parts in a thousand as against 925. All "silver" coins from 1 January 1947 are made of cupro-nickel, composed of 75% copper and 25% nickel. Maundy money is, however, made of silver, at the standard of 925 parts per 1000.

Bronze, introduced in 1860 to replace copper, varies slightly in composition from time to time. At present it consists of 97% copper, ½% tin, and 2½% zinc.

Nickel Brass. The twelve-sided threepenny piece is composed of copper 79%, zinc 20%, and nickel 1%.

Bank of England Notes are issued for sums of 10*s.*, £1, £5 and £10. 10*s.* and £1 bank notes are legal tender in Great Britain and Northern Ireland, £5 and £10 bank notes in England and Wales only. The old 10*s.* and £1 notes (without the portrait of Her Majesty the Queen), the old £5 and £10 notes (on white paper), and all notes of higher denominations have ceased to be legal tender; they are, however, still exchangeable at the Bank of England.

Legal Tender of Coin. Gold coins, dated 1838 onwards, if not below the minimum current weight, are legal tender (but see above). Silver and/or cupro-nickel coins from 1816 onwards are legal tender for sums not exceeding £2, nickel-brass (3*d.*) from 1937 for sums not exceeding 2*s.*, and bronze from 1860 (with the exception of the farthing which was demonetised from 1 January 1961) for sums not exceeding 1*s.* No one can demand "change".

Decimal Currency. The Decimal Currency Act, 1967, provides for the adoption in 1971 of a currency system based on the pound sterling divided into one hundred new pence. The coins authorised for issue by the Act are:

Denomination.	Standard weight.	Standard diameter.
Cupro-Nickel:		
10 New Pence	11·31036	2·8500
5 New Pence	5·65518	2·3595
2 New Pence	7·12800	2·5910
1 New Penny	3·56400	2·0320
½ New Penny	1·78200	1·7145

The Government's decision in 1966 to introduce a decimal currency system was a historic one, since the system of pounds, shillings and pence has been in use since the 12th cent., while records show that a silver penny was minted in Kent as early as A.D. 770.

Decimal Coin Designs. The portrait of The Queen that appears on the obverses of all the new coins is the work of Mr. Arnold Machin, O.B.E., R.A., and is already in use on the coinages of a number of other Commonwealth countries including Canada, Australia and New Zealand.

The reverse designs, which are the work of Mr. Christopher Ironside, are as follows:

Ten New Pence. 10p (2*s.*): Part of the crest of England. A lion passant guardant royally crowned. This design may also be described as part of the crest of the United Kingdom of Great Britain and Northern Ireland.

Five New Pence. 5p (1*s.*): The badge of Scotland. A thistle royally crowned.

Two New Pence. 2p (4·8*d.*): The badge of The Prince of Wales. Three ostrich feathers enfiling a coronet of crosses pattee and fleurs de lys with the motto ICH DIEN.

One New Penny. 1p (2·4*d.*): A portcullis with chains royally crowned, originally a badge of King Henry VII. In modern times it has been particularly associated with the Palace of Westminster and is used extensively as a badge connected with Parliament.

New Halfpenny. ½p (1·2*d.*): The Royal Crown.

Notes:

(1) The United Kingdom will change over to decimal currency on Monday, 15 February 1971—Decimal Day or D Day.

(2) The pound (£) will stay unchanged.

(3) There will be 100 new pennies (100p) to each £: so each new penny will be worth 2·4 of our present pennies.

(4) Our seven £sd coins will be replaced by six decimal ones, but the changes will not all take place at once.

(5) There will be a 50p (10*s.*) coin of a shape and size yet to be settled which will replace the ten-shilling note.

(6) The 5p and 10p coins are identical in value, size, weight and metal content with shillings and florins and completely interchangeable with them. Only the designs differ. They will be issued in 1968. The 50p coin will also appear before D Day, perhaps in 1969, to be used as a ten-shilling piece. These changes will help to prepare people for the changeover.

(7) The new bronze coins will not be legal tender until D Day, but before the end of 1968 people will be able to buy them in souvenir sets and for educational or training purposes.

(8) The existing halfpenny will cease to be legal tender from 1 August 1969 and the halfcrown at the end of 1969; so both coins will have disappeared before D Day.

(9) On and from D Day the Banks will work in decimals and all cheques will then have to be written in decimals.

(10) To help shoppers before and during the changeover, shops will probably mark items with both the £sd and the decimal prices and conversion tables will be prominently displayed.

WEIGHTS AND MEASURES

1. IMPERIAL WEIGHTS AND MEASURES.

AVOIRDUPOIS.

1 dram (dr.)	27·34375 grains (gr.)
16 drams	1 ounce (oz.) = 437·5 gr.
16 ounces	1 pound (lb.) = 7000 gr.
14 pounds	1 stone
28 pounds	1 quarter
4 quarters	1 hundredweight (cwt.) = 112 lb.
20 hundredweight	1 ton = (2240 lb.)

TROY WEIGHT.

1 pennyweight (dwt.)	24 grains
480 grains	1 ounce

The only unit of troy weight which is now legal for use in trade in this country is the ounce Troy, and weighings of precious metals are made in multiples and decimals of this unit.

The term *carat* is not a unit of weight for precious metals, but is used to denote the quality of gold plate, etc., and is a figure indicating the number of 24ths of pure gold in the alloy, *e.g.*, a 9 carat gold ring consists of nine parts of pure gold and fifteen parts of base metals.

CAPACITY MEASURE.

4 gills	1 pint
2 pints	1 quart
4 quarts	1 gallon
2 gallons	1 peck
4 pecks	1 bushel
8 bushels	1 quarter
36 bushels	1 chaldron

The gallon, as the capacity standard, is based upon the pound.

1 gallon = 277·274 cubic inches.

APOTHECARIES' WEIGHT.

20 grains	1 scruple
3 scruples	1 drachm
8 drachms	1 ounce

While the apothecaries' ounce is the same as the troy ounce, there is no such thing as an apothecaries' or troy pound of 12 ounces.

The metric system (with apothecaries' equivalents) is used for formulae and prescriptions in the *British Pharmacopœia.*

APOTHECARIES' FLUID MEASURE.

60 minims (min.)	1 fluid drachm
8 fluid drachms	1 fluid ounce
20 fluid ounces	1 pint

There are 437½ grains weight of distilled water at 62° F. in 1 fluid ounce.

LINEAR MEASURE.

1 nail	$\frac{1}{16}$ yard
1 link	7·92 inches
12 inches	1 foot
3 feet	1 yard
22 yards	1 chain
10 chains	1 furlong
8 furlongs	1 mile = 1760 yards

SQUARE MEASURE.

144 sq. inches	1 sq. foot
9 sq. feet	1 sq. yard = 1296 sq. inches
484 sq. yards	1 sq. chain
1210 sq. yards	1 rood
10 sq. chains	1 acre
4 roods	1 acre
4840 sq. yards	1 acre
640 acres	1 sq. mile

CUBIC OR SOLID MEASURE.

1728 cu. inches	1 cu. foot
27 cu. feet	1 cu. yard

The primary standards are the yard, pound, metre and kilogram.

The international yard = 0·9144 metre (and so defined under the Weights and Measures Act 1963).

The international pound = 0·45359237 kilogram.

Note.—The Government announced in 1965 that it was encouraging the adoption of the metric system of weights and measures and by 1975 the greater part of British industry should have effected the change.

2. METRIC WEIGHTS AND MEASURES.

LINEAR MEASURE.

10 millimetres (mm.)	1 centimetre (cm.)
10 centimetres	1 decimetre (dm.)
10 decimetres	1 METRE (m.)
10 metres	1 dekametre (dam.)
10 dekametres	1 hectometre (hm.)
10 hectometres	1 kilometre (km.)

SURFACE OR SQUARE MEASURE.

100 centiares	1 are = 100 sq. metres
100 ares	1 hectare = 10,000 sq. metres

CAPACITY.

10 millilitres (ml.)	1 centilitre (cl.) = 10 c.c.
10 centilitres	1 decilitre (dl.) = 100 c.c.

CAPACITY (*cont.*).

10 decilitres	1 LITRE (lit.) = 1000 c.c.
10 litres	1 dekalitre (dal.)
10 dekalitres	1 hectolitre (hl.)
10 hectolitres	1 kilolitre (kl.) = 1 cu. metre

WEIGHT.

1000 micrograms	1 milligram (mg.)
10 milligrams	1 centigram (cg.)
10 centigrams	1 decigram (dg.)
10 decigrams	1 GRAM (gm.)
10 grams	1 dekagram (dag.)
10 dekagrams	1 hectogram (hg.)
10 hectograms	1 kilogram (kg.)
The metric carat	0·2 gram

3. IMPERIAL AND METRIC EQUIVALENTS.

LINEAR MEASURE.

Imperial to Metric

1 inch	2·54 centimetres
1 foot	30·48 centimetres
1 yard	0·9144 metre
1 chain (22 yards)	20·1168 metres
1 furlong (220 yards)	201·168 metres
1 mile (8 furlongs)	1·6093 kilometres

Note.—The physical metre, the platinum-iridium bar kept at Sèvres, was rendered obsolete when in 1960 the metre was re-defined in terms of a wavelength of light.

Metric to Imperial

1 millimetre	0·039 37 inch
1 centimetre	0·3937 inch
1 decimetre	3·937 inches
1 metre	39·370 078 740 16 inches
1 metre	3·280 839 895 feet
1 metre	1·093 613 198 yards
1 dekametre	10·936 yards
1 hectometre	109·36 yards
1 kilometre	0·621 37 mile

SQUARE MEASURE

Imperial to Metric.		Metric to Imperial.	
1 sq. inch	6·4516 sq. cm.	1 sq. cm.	0·15500 sq. inch
1 sq. foot	9·2903 sq. decimetres	1 sq. metre	10·7639 sq. feet
1 sq. yard	0·836127 sq. metre	1 sq. metre	1·1960 sq. yards
1 rood (1210 sq. yd.)	10·117 ares	1 are (100 sq. metres)	119·60 sq. yards
1 acre (4840 sq. yd.)	0·40468 hectare	1 hectare (100 ares or 10,000 sq. metres)	2·4711 acres
1 sq. mile (640 acres)	258·999 hectares		

CUBIC MEASURE

Imperial to Metric.		Metric to Imperial.	
1 cu. inch	16·387 cu. cm.	1 cu. centimetre	0·0610 cu. inch
1 cu. foot (1728 cu. in.)	0·028317 cu. metre	1 cu. decimetre (1000 cu. cm.)	61·024 cu. inches
1 cu. yard (27 cu. ft.)	0·764553 cu. metre	1 cu. metre	35·3148 cu. feet
		1 cu. metre	1·307954 cu. yards

CAPACITY MEASURE

Imperial to Metric.		Metric to Imperial.	
1 gill	1·42 decilitres	1 centilitre	0·070 gill
1 pint	0·568 litre	1 decilitre	0·176 pint
1 quart	1·136 litres	1 litre	1·75980 pints
1 gallon	4·546 litres	1 dekalitre	2·200 gallons
1 peck (2 gallons)	9·092 litres	1 hectolitre	2·75 bushels
1 bushel (8 gallons)	3·637 dekalitres		
1 quarter (8 bushels)	2·909 hectolitres		

APOTHECARIES' MEASURE

Imperial to Metric.		Imperial to Metric.	
1 minim	0·059 millilitre	1 pint	0·568 litre
1 fluid scruple	1·184 millilitres	1 gallon (8 pints or 160 fluid ounces)	4·546 litres
1 fluid drachm (60 minims)	3·552 millilitres		
1 fluid ounce (8 drachms)	2·84123 centilitres		

AVOIRDUPOIS WEIGHT

Imperial to Metric.		Metric to Imperial.	
1 grain	0·0648 gram	1 milligram	0·015 grain
1 dram	1·772 grams	1 centigram	0·154 grain
1 ounce (16 drams)	28·350 grams	1 decigram	1·543 grains
1 pound (16 ounces or 7000 grains)	0·453592 kilogram	1 gram	15·432 grains
1 stone (14 lb.)	6·350 kilograms	1 dekagram	5·644 drams
1 quarter (28 lb.)	12·70 kilograms	1 hectogram	3·527 ounces
1 cwt. (112 lb.)	50·80 kilograms = 0·5080 quintal	1 kilogram (1000 gm.)	2·20462 lb.
1 ton (20 cwt.)	1·0160 tonnes or 1016 kilograms	1 myriagram (10 kg.)	22·046 lb.
		1 quintal (100 kg.)	1·968 cwt.
		1 tonne (1000 kg.)	0·9842 ton

TROY WEIGHT

Imperial to Metric.		Metric to Imperial.	
1 grain	0·0648 gram	1 gram	0·03215 ounce troy
1 pennyweight (24 grains)	1·552 grams	1 gram	15·432 grains
1 troy ounce (20 pennyweights)	31·1035 grams		

APOTHECARIES' WEIGHT

Imperial to Metric.		Metric to Imperial.	
1 grain	0·0648 gram	1 gram	0·2572 drachm
1 scruple (20 grains)	1·296 grams	1 gram	0·7716 scruple
1 drachm (3 scruples)	3·888 grams	1 gram	15·432 grains
1 ounce (8 drachms)	31·1035 grams		

SI UNITS

The system based on the following six basic units is called the International System of Units (SI). It is replacing older systems in several branches of science and technology. There are, at present, differences in metric practice between the various metric countries but SI units will become, in time, the only acceptable international system.

	SI Unit	*Symbol*
Length	metre	m
Mass	kilogram	kg
Time	second	s
Electric current	ampere	A
Thermodynamic temperature	degree Kelvin	°K]
Luminous intensity	candela	cd

Some Derived SI Units.

	SI Unit	*Symbol*
Force	newton	N = kg m/s²
Work, energy, quantity of heat	joule	J = N m
Power	watt	W = J/s
Electric charge	coulomb	C = A s
Electrical potential	volt	V = W/A
Electric capacitance	farad	F = A s/V
Electric resistance	ohm	Ω = V/A
Magnetic flux	weber	Wb = V s
Inductance	henry	H = V s/ A
Luminous flux	lumen	lm = cd sr
Illumination	lux	lx = l m/m²

Some Derived SI Units (*cont.*)

	SI Unit	*Symbol*
Frequency . .	cycle per second	c/s
Angular velocity	radian per second	rad/s
Pressure . .	newton per sq. metre	N/m^2
Surface tension .	newton per metre	N/m
Thermal conductivity .	watt per metre degree Kelvin	W/(m°K)
Electric field strength . .	volt per metre	V/m
Magnetic flux density . .	weber per sq. metre	Wb/m^2
Magnetic field strength . .	ampere per metre	A/m
Luminance . .	candela per sq. metre	cd/m^2

Note.—In Continental literature the frequency unit is the hertz (symbol Hz), the weber unit, the tesla (symbol T).

Prefixes for decimal multiples and sub-multiples of units are indicated thus:

	Multiple	*Symbol*
$\times 10^{12}$	tera	T
$\times 10^{9}$	giga	G
$\times 10^{6}$	mega	M
$\times 10^{3}$	kilo	k
$\times 10^{2}$	hecto	h
$\times 10$	deca	da
	Sub-multiple	
$\times 10^{-1}$	deci	d
$\times 10^{-2}$	centi	c
$\times 10^{-3}$	milli	m
$\times 10^{-6}$	micro	μ
$\times 10^{-9}$	nano	n
$\times 10^{-12}$	pico	p
$\times 10^{-15}$	femto	f
$\times 10^{-18}$	atto	a

Note.—The prefixes carry no hyphen, *e.g.*, megaelectronvolt.

UNITS AND DIMENSIONS

	Dimension	SI Unit (symbol)	UK Unit (symbol)	Ratio
Length			in	**0·0254**
			ft	**0·3048**
			yd	**0·9144**
			mile	**1609·344**
Velocity . . .	LT^{-1}	m/s	ft/s	**0·3048**
			mile/h	**0·447 04**
Mass	M	kg	lb	**0·453 592 37**
Density. . . .	ML^{-3}	kg/m^3	lb/in^3	$2.767\ 99 \times 10^4$
			lb/ft^3	16·0185
			lb/Ukgal	99·7764
Force	MLT^{-2}		pdl	0·138 255
			lbf	4·448 22
Pressure . . .	$ML^{-1}T^{-2}$	N/m^2	lbf/in^2	6894·76
Energy (work, heat)	ML^2T^{-2}	J	ft pdl	0·042 140 1
			ft lbf	1·355 82
			cal	**4·1868**
			Btu	1055·06
Power	ML^2T^{-3}	W	hp	745·700

Note.—Figures printed in bold type are exact. Unit symbols are the same in the singular and the plural and do not carry a full point (as a mark of an abbreviation). The symbol for the poundal is pdl and for the pound-force lbf. N = 10^5 dynes, J = 10^7 ergs (in c.g.s. system).

INTERNATIONAL PAPER SIZES

Trimmed or finished sizes

" A " Series

(Books and Magazines)

Designation	Size (mm)	Size (in)
A0	841 × 1189	33·11 × 46·81
A1	594 × 841	23·39 × 33·11
A2	420 × 594	16·54 × 23·39
A3	297 × 420	11·69 × 16·54
A4	210 × 297	8·27 × 11·69
A5	148 × 210	5·83 × 8·27
A6	105 × 148	4·13 × 5·83
A7	74 × 105	2·91 × 4·13
A8	52 × 74	2·05 × 2·91
A9	37 × 52	1·46 × 2·05
A10	26 × 37	1·02 × 1·46

Note.—The basis of the international series of paper sizes is a rectangle having an area of 1 sq. metre, the sides of which are in the proportion of 1 : $\sqrt{2}$ (a geometrical relationship, the side and diagonal of a square being in that proportion). In addition there is a series of " B " sizes intermediate between any two adjacent sizes of the " A " series (for posters, etc.) and of " C " sizes (for envelopes).

SIZES OF BOUND BOOKS

Name	Size of untrimmed page (in)	Size of untrimmed page (mm)
Foolscap octavo .	6¾ × 4¼	170 × 110
Crown octavo . .	7½ × 5	190 × 125
Large crown octavo	8 × 5¼	205 × 135
